DATE OF RULING

May 18th, 1995

APPEARANCES

Mr. David Earle, Chairman
Teen Activity Centre
Deep River, Ontario
For the Applicant

RULING

1. **The Applicant**

   Mr. Davis Thompson, Owner, 773978 Ontario Inc. received an Order to Comply under the Building Code Act, 1992 requiring the fire resistance rating of the vertical fire separation between a Teen Activity Centre (TAC) and an adjacent Drug Store at 7 Champlain St., Deep River, Ontario.

2. **Description of Constrution**

   The subject one storey building originally contained a drug store and an adjoining shoe store. The wall separating these premises is constructed with two layers of drywall. The Applicant proposed to change the use of the shoe store portion of the building to a Teen Activity Centre. The building area is 528 m² (5684 ft²). The area of the proposed Teen Activity Centre is 125 m ² (1346 ft²). The building is of combustible construction, unsprinklered and does not contain a fire alarm system.

3. **Dispute**

   The dispute between the Applicant and Respondent concern an interpretation of Article 10.2.1.1., Sentence 3.1.2.1.(1) and Article 1.1.3.2. (i.e. the definition of Business and Personal Services Occupancy, Mercantile Occupancy and Assembly Occupancy) of the Building Code. At issue is whether a Group D or E major occupancy classification is more appropriate for the proposed Teen Activity Centre (TAC) than a Group A-2 classification, thereby eliminating the need to upgrade the vertical fire separation between TAC and the adjacent Drug Store.

4. **Provision of the Building Code**

10.2.1.1. Classification of Major Occupancy

Every existing building or part thereof shall be classified according to its major occupancy in accordance with the requirements of Subsection 3.1.2.

3.1.2.1. Classification of Buildings

1. Except as provided in Articles 3.1.2.3. to 3.1.2.6., every building or part thereof shall be classified according to its major occupancy as belonging to one of the Groups or Divisions described in Table 3.1.2.A.

1.1.3.2. Definitions of Words and Phrases

Assembly Occupancy means the occupancy or the use of a building, or part thereof, by a gathering of persons for civic, political, travel, religious, social, educational, recreational or like purposes, or for the consumption of food or drink.

Business and Personal Services Occupancy (D) means the occupancy or use of a building or part thereof for the transaction of business or the rendering or receiving of professional or personal services.

Mercantile Occupancy (E) means the occupancy or use of a building or part thereof for the displaying or selling of retail goods, wares of merchandise.

5. **Applicant's Position**

he Applicant submitted that Group D or E occupancy classification is more appropriate than a Group A occupancy because of the nature of the activities and the number of occupants that will use the Teen Activity Centre.

The Applicant submitted that the function of the building is primarily a preventative crisis centre with an adult always on duty. The occupant load is never more than 15 persons and is usually less than 10. The applicant noted that although restaurants are classified Group A-2, restaurants with an occupancy load less than 30 are classified Group E. TAC would accept a less than 30 occupancy requirement. Furthermore, there is no smoking, no drinking, no drugs and no cooking permitted at the centre.

The Applicant submitted that the building has exits front and back. The fire hazard has not increased from the previous use as a shoe store.

The Applicant referred to Appendix A-3.1.2.A (Major Occupancy) with respect to the TAC premises and submitted that the appropriate classification may be ambiguous. In some ways the Group A-2 occupancy classification would seem appropriate since people do assemble there. However, all of the Group A-2 examples in the appendix are for large assembly areas such as schools, dance halls, lecture halls etc. The TAC premises is approximately 1300 ft² and there are seldom more than a dozen people present.

The TAC is used for teen age counselling and discussion groups concerning pregnancy issues, drug abuse, referrals to other agencies and Young Drivers of Canada. The small floor area, the presence of a staff person and because the major purpose of TAC is to help troubled teens, the closest identified classification is a Business & Personal Services occupancy.

TAC will be employing a full time social worker to organize programs for teens and preteens. Part of the space will be used as an office by the new employee.

6. **Chief Building Officials Position**

The Respondent submitted that the required 1.5 h fire separation between the space used by TAC and the Drug Store has not been provided. A Group A-2 occupancy classification is applicable since teenagers congregate in the building to socialize.

The space was formerly a shoe store (i.e. Group E, mercantile occupancy). The result is a change of use from Group E to Group A-2 with an adjoining Group E occupancy (i.e. drug store) sharing a common fire separation.

The Respondent submitted that the main concern is the provision of the required 1.5 hour fire separation between TAC and the drug store.

The Respondent submitted that an integrated operation such as TAC should be judged by the most stringent requirement (i.e. a gathering of persons for recreational or like purposes) which is Group A-2.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that a Business and Personal Service Occupancy (Group D) classification of the Teen Activity Centre complies with the Building Code provided the occupant load does not exceed 30 persons.

8. **Reason:**

The use as described by the applicant is more consistent with the rendering or receiving of personal services, such as counselling, crisis intervention, and other related referral services with a staff person present at all times.

APPEARANCES

Mr. George Tott, Consulting Engineer
Geotasco Inc.
Willowdale, Ontario
For the Applicant

Mr. Prakash Parikh
Senior Structural Engineer
City of Scarborough
For the Respondent

RULING

1. **The Applicant**

   Mr. Thomas Feeley, Gwillimbury Homes is an applicant for a permit under the Building Code Act, 1992 to construct a retaining wall along the rear portion of the access to the garage of unit #1 and along the south side of the same driveway against a pedestrian walkway for a townhouse project at 4 Mason Road, Scarborough, Ontario.

2. **Description of Constrution**

   The applicant proposed to replace an existing timber retaining wall with an engineered system of concrete blocks known as Risi Stones which are anchored by means of woven polymeric geotextile material into cement stabilized soil.

   The height of the retaining wall varies from 1.6 m (5.25 ft.) to 2.3 m (7 ft. 9 in.).

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the sufficiency of compliance with the technical requirements of Clause 2.1.2.1.(1)(a) and Sections 4.1 and 4.3 of the Building Code. At issue is the use of a woven polymeric geotextile material (i.e. Risigrid) as a structural tieback component of the retaining wall.

4. **Provision of the Building Code**

Clause 2.1.2.1.(1)(a) Designated Structures

1. Part 4 applies to the following designated structures:
    a. a retaining wall exceeding 1 m (3 ft. 3 in.) in exposed height adjacent to
        i. public property,
        ii. access to a building, or
        iii. private property to which the public is admitted,

Other Provisions of the Building Code: Section 4.1, Structural Loads and Procedures and Section 4.3, Design Requirements for Structural Materials.

5. **Applicant's Position**

The Applicant submitted calculations and supporting documentation to verify the acceptability of the engineered retaining wall.

The Applicant submitted that a building material not specifically covered by the Building Code is not a "prohibitive material". The use of a woven polymeric geotextile material (i.e. Risigrid) as a structural component of the retaining wall meets good engineering practice.

Furthermore, the Applicant submitted that geotextiles have been used for the past decade in similar applications.

6. **Chief Building Officials Position**

The Respondent submitted that the retaining wall was a "Designated Structure" subject to Part 4 of the Building Code. A critical component of the design is the use of a polyvinylchloride coated fabric (i.e. Risigrid) as a structural tieback material. The Respondent stated that it's use was not specifically authorized under the Building Code or by any of the reference standards.

The Respondent submitted that Section 4.1 of the Building Code requires structural members to be designed having regard to expected service life. Furthermore, Section 4.3 of the Building Code provides design requirements for structural materials. The Respondent submitted that the applicant should provide a CCMC evaluation or BMEC authorization indicating an equivalent level of performance to Sections 4.1 and 4.3 of the Building Code.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that the proposed retaining walls show sufficiency of compliance with the technical requirements of the Building Code provided the applicant submits a final sealed and signed report by a Professional Engineer licensed under the Professional Engineers Act (Ontario) to the municipality detailing all calculations, field inspection reports and a list of projects utilizing the retaining wall system in Ontario.

8. **Reasons:**
   1. The reinforced earth retaining wall system is not a new concept and has been utilized across Ontario in various forms and is recognized by the Canadian Geotechnical Society as detailed in the Canadian Foundation Engineering Manual.
   2. A licensed Professional Engineer provided engineering services (i.e. calculations & inspections) in accordance with the Professional Engineers Act (Ontario).
   3. An independent licensed consulting engineer's testimony confirmed the suitability of the retaining wall system.

Dated at Toronto, this 4th day, in the month of May, in the year 1995, for application number 1995-18.

APPEARANCES

Mr. Bernhard G. Gall, President
Acapulco
Kitchener, Ontario
For the Applicant

Mr. David Carroll
Supervisor of Building Inspectors
City of Cambridge
For the Respondent

RULING

1. **The Applicant**

   The City of Cambridge is an applicant for a permit under the Building Code Act, 1992 to renovate an existing outdoor public swimming pool at First (1st) Avenue and Glen Morris Street, Cambridge, Ontario.

2. **Description of Constrution**

   The project is a renovation of an existing outdoor public swimming pool which includes the installation of a barrier free ramp and a "beach entry" ramp. The pool is 15.2 m by 30.5 m (50' by 100') and it has a maximum depth of 3.25 m (10' 8"). The proposed ramp has a slope of 1 in 12 and a width of 8.83 m. The ramp entry into the pool is separated from the lap pool by a 0.3 m (1') wide concrete wall 16.5 m (54') long. The wide entry ramp into the pool is provided with:

   a. a trench skimmer along the shallow end, facilitating proper recirculation and disinfection of the pool water;
   b. water depth marking on the deck; and,
   c. delineation markings showing changes in slopes on the pool bottom.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the sufficiency of compliance with the technical requirements of Sentences 3.11.3.1.(4) & 3.11.5.1.(1) of the Building Code. At issue is a request to install a "beach entry" ramp with a slope of 1 in 12 and a width of 8.83 m in the George Hancock Memorial Pool.

4. **Provision of the Building Code**

Sentence 3.11.3.1.(4): Construction Requirements

4. Except for a modified pool, wave action pool, a pool for therapeutic use and a pool described in Sentence 3.11.5.1.(1), a public pool shall be constructed to have a water depth of not less than 750 mm (2 ft 6 in).

Sentence 3.11.5.1.(1): Ramps into Pools

5. Notwithstanding Sentences 3.11.3.1.(4) and (7) and Clause 3.11.3.1.(8)(a), where a public pool is constructed in a building containing a Group B, Division 2, major occupancy, and has a water depth not exceeding 1.5 m (4 ft 11 in) and a water surface area not exceeding 100 m^2 (1080 ft^2), the pool deck contiguous to not more than 50 per cent of the total perimeter of the pool may be replaced by one or more ramps that will permit a bather seated in a wheelchair to enter the water with or without the wheelchair.

2. **Applicant's Position**

The Applicant submitted that the allowable maximum ramp width is not defined in the Building Code, therefore the proposed ramp with a slope of 1 in 12 and a width of 8.83 m provides adequate compliance with the intent of the Building Code. The applicant submitted that the wide ramp entry into the pool is valid for the following reasons:

. the ramp entry into the pool is separated from the lap pool by a 0.3 m (1') wide concrete wall 16.5 m (54') long;

a. a trench skimmer along the shallow end, facilitating proper recirculation and disinfection of the pool water;

b. water depth marking on the deck; and

c. delineation markings showing changes in slopes on the pool bottom.

2. **Chief Building Officials Position**

The Respondent submitted that the project is a renovation of an existing outdoor public swimming pool which includes the installation of a barrier free ramp and a "beach entry" ramp.

The Respondent submitted that it appears the design contravenes Sentence 3.11.3.1.(4) and 3.11.5.1.(1) of the Building Code.

The Respondent does not have the authority to permit a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

3. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that the proposed installation of a barrier free ramp and "beach entry" ramp in the existing public pool shows sufficiency of compliance with the technical requirements of the Building Code provided a guard is installed as per the Building Code height requirement along the unprotected pool deck extending from the 0 to 750 mm water depth.

4. **Reason:**

   The minimum pool depth requirement of 750 mm is intended to prevent injury to pool users when jumping into the pool. Installing a guard on the pool deck meets this intent.

   The Housing Development and Buildings Branch of the Ministry of Housing is considering an amendment to the Building Code to address this issue.

Dated at Toronto, this 4th day, in the month of May, in the year 1995, for application number 1995-19.

APPEARANCES

Mr. Don Tedford, Building Inspector
Township of Arran, County of Bruce
For the Respondent

RULING

1. **The Applicant**

   Mr. Martin Lane Lemcke, House Owner, Owen Sound is an applicant for a permit under the Building Code Act, 1992 to construct a single family dwelling (i.e. house) with an attached garage.

2. **Description of Constrution**

   The subject building is a raised bungalow (i.e. house) with an attached garage. The structural framing consists of a combination log-type and wood frame construction.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the sufficiency of compliance with the technical requirements of Section 9.37 and Subsection 9.23.13. of the Building Code. At issue is whether the construction of a single family dwelling (i.e. house) is in accordance with the log construction requirements of Section 9.37 and the roof and ceiling framing requirements of Subsection 9.23.13. of the Building Code.

4. **Provision of the Building Code**

   Section 9.37 Log Construction

   Subsection 9.23.13. Roof and Ceiling Framing

5. **Applicant's Position**

   The Applicant submitted that the building sufficiently complies with the log construction and roof and ceiling framing requirements in the Building Code.

6. **Chief Building Officials Position**

   The Respondent submitted that the log construction and roof and ceiling framing was unacceptable due to the following reasons:

   a. Site inspections by the municipality indicate that the construction does not conform to the Building Code (e.g. log joint detail, lumber species, framing deficiencies, etc.).
   b. Reports from two consulting companies confirm that the building construction does not comply with the structural requirements of the Building Code.

7. **Commission Ruling:**

   In favour of the Respondent. It is the decision of the Building Code Commission that the log building currently under construction does not comply with the technical requirements of the Building Code. The Applicant must seek structural engineering services of a Professional Engineer licensed under the Professional Engineers Act (Ontario) to certify that the construction conforms to the Building Code.

8. **Reason:**

   The engineering report submitted indicates the house structure built to-date does not comply with the Building Code.

Dated at Toronto, this 4th day, in the month of May, in the year 1995, for application number 1995-14.

North York, Ontario
For the Applicant

RULING

1. **The Applicant**

   Mr. Lorie Pella, Vanbots Construction Corporation is an applicant for a permit under the Building Code Act, 1992 to construct a No Frills grocery store at 1030 Coverdale Drive, Kingston, Ontario.

2. **Description of Constrution**

   The proposed building is a one storey sprinklered grocery store designed in conformance with Article 3.2.2.44. of the Building Code. The building area is 3010 m².

   The western portion of the proposed store is adjacent to a large storm water retention area. The limiting distance requires the west exposing building face to have a two hour fire resistance rating.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the sufficiency of compliance with the technical requirements of Article 3.2.3.7. of the Building Code. At issue is a request to shift a portion of the required limiting distance to the abutting storm water retention pond by registering an agreement on the title of both properties that limits future construction. This would eliminate the need of a fire resistance rating for the west exposing building face.

4. **Provision of the Building Code**

   Article 3.2.3.7.: Construction of Exposing Building Face

1. Except as permitted in Articles 3.2.3.9. and 3.2.3.10., where a limiting distance shown in Table 3.2.3.A. for a Group A, B, C, D or Group F, Division 3 occupancy classification is such as to permit an exposing building face to have unprotected openings of
    a. not more than 10 per cent of the exposing building face, the exposing building face shall be of noncombustible construction having a fire-resistance rating of not less than 1 h and be clad with noncombustible cladding,
    b. more than 10 per cent but not more than 25 per cent of the exposing building face, the exposing building face shall have a fire-resistance rating of not less than 1 h and be clad with noncombustible cladding, and
    c. more than 25 per cent but less than 100 per cent of the exposing building face, the exposing building face shall have a fire-resistance rating of not less than 45 min.
2. Except as permitted in Article 3.2.3.9., where a limiting distance shown in Table 3.2.3.B. for a Group E, or Group F, Division 1 or 2 occupancy classification is such as to permit an exposing building face to have unprotected openings of
    a. not more than 10 per cent of the exposing building face, the exposing building face shall be of noncombustible construction having a fire-resistance rating of not less than 2 h and be clad with noncombustible cladding,
    b. more than 10 per cent but not more than 25 per cent of the exposing building face, the exposing building face shall have a fire-resistance rating of not less than 2 h, and be clad with noncombustible cladding, and
    c. more than 25 per cent but less than 100 per cent of the exposing building face, the exposing building face shall have a fire-resistance rating of not less than 1 h.
3. In addition to the requirements of Sentences (1) and (2), where foamed plastic insulation is used in an exterior wall of a building more than 3 storeys in building height
    a. the insulation shall be protected on the exterior surface by
        i. concrete or masonry not less than 25 mm (1 in) thick, or
        ii. noncombustible material that will remain in place for not less than 15 min when tested in conformance with CAN4-S101-M, "Standard Methods of Fire Endurance Tests of Building Construction and Materials", or
    b. the wall assembly shall conform to Article 3.1.5.5. where the protection in Clause (a) is not provided.

5. **Applicant's Position**

The Applicant submitted that the property adjacent to the west face of the building will serve as a water retention pond for the No Frills Store and surrounding residential properties. The property is not intended for future development.

The Applicant submitted that the Township of Kingston municipal Council passed the following resolution on March 21, 1995:

That the Council of the Corporation of the Township of Kingston approve the request submitted by Mr. Joseph Tadros, Architect on behalf of No Frills store, 130 Coverdale Drive in order to permit a shift of the requirement for spatial separtion to the abutting storm water pond as detailed in a report of the Chief Building Official dated March 7, 1995.

The applicant has agreed to cover the cost of preparation and registration of an agreement to carry out the intent of Council's resolution.

6. **Chief Building Officials Position**

The Respondent submitted that the location of the building with respect to the property line separating the No Frills property from the storm water retention pond requires the west wall of the store to have a two hour fire resistance rating.

The Respondent submitted that the municipality has agreed to shifting a portion of the limiting distance to the abutting property and registration of an agreement on title is eminent. This would eliminate the need of a fire resistance rating for the west exposing building face.

The Respondent does not have the authority to permit a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that shifting the limiting distance to the abutting storm water retention pond provides sufficiency of compliance with the Building Code requirements.

8. **Reason:**

The adjacent property is owned by the Township. Council agreed to enter into an agreement to limit future construction within the shifted limiting distance area and register it on title.

Dated at Toronto, this 25th day, in the month of April, in the year 1995, for application number 1995-11.

For the Applicant

Mr. John Bosyj
HVAC Inspector/Plans Examiner
City of Guelph
For the Respondent

RULING

1. **The Applicant**

   Mr. Peter Szpular, Owner received an Order to Comply under the Building Code Act,1992 prohibiting the use of a gas fired forced air heating system to heat 4 apartment units and circulate air to 4 suites, the public corridor and a common exit stair, at 250 Alma Street North, Guelph, Ontario.

2. **Description of Constrution**

   The existing 4 unit apartment building was originally heated by electrical baseboard heaters. The baseboard heating system was changed to a gas fired forced air system that heats 4 apartment units and circulates air to 4 suites, the public corridor and a common exit stair.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the sufficiency of compliance with the technical requirements of Sentences 6.2.3.11.(2) & 9.9.4.2.(4) of the Building Code. At issue is whether the proposed installation for a gas fired forced air heating system to heat 4 Apartment units and circulate air to 4 suites, the public corridor and a common exit stair provides sufficiency of compliance with the Building Code.

4. **Provision of the Building Code**

   Sentence 6.2.3.11.(2): Interconnection of Systems

2. In a residential occupancy, air from one suite shall not be circulated to any other suite nor to a public corridor or public stairway.

Sentence 9.9.4.2.(4): Fire Separation for Exits

4. A fire separation that separates an exit from the remainder of the building shall have no openings except those for electrical wiring, noncombustible conduit and noncombustible piping that serve only the exit and for standpipes, sprinkler piping, exit door-ways and wired glass and glass block permitted in Article 9.9.4.3.

5. **Applicant's Position**

The Applicant submitted that Compliance Alternatives C80, C147, and C148 of Part 11 of the Building Code should be applied to this subject building.

The applicant submitted that smoke detectors would be installed in the supply and return air duct system serving the entire building. Activation of the smoke detectors would turn off the fuel supply and electrical power to the heating system.

6. **Chief Building Officials Position**

The Respondent submitted that the applicant's proposal is unsatisfactory because the building is not considered a heritage building nor are there any structural or construction difficulties which would prevent the applicant from complying with the Building Code. Furthermore, the proposal to match existing under Subsection 11.3.2. of the Building Code cannot be used in this case because the entire heating system is being replaced.

The respondent does not have the authority to permit a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that the existing forced air heating system serving dwelling units provides sufficiency of compliance with the Building Code subject to the following conditions:

4. The smoke alarms in the dwelling units will be interconnected.
5. Duct smoke detectors will be installed in the supply and return air system which would turn off the fuel supply and electrical power to the heating system upon activation.

6. Fire dampers with a 45 min fire protection rating will be installed where the ducts pierce fire separations required to have a fire resistance ratings.
7. High efficiency air cleaners will be installed at the source.

8. **Reason:**

The system as described, including the above conditions, will exceed the requirements of the compliance alternatives in Part 11 of the Building Code.

Dated at Toronto, this 25th day, in the month of April, in the year 1995, for application number 1995-07.

Oakville, Ontario
For the Applicant

Mr. Frank Asta
Chief Building Official
Town of Oakville
For the Respondent

RULING

1. **The Applicant**

   Mr. Elie Ghazel, Lear Seating Canada Ltd. is an applicant for a permit under the Building Code Act, 1992 to connect two locker and dressing room trailers to an existing sprinklered building, at 2700 Bristol Circle, Oakville, Ontario.

2. **Description of Constrution**

   The existing building is approximately 8450 m² (91,000 square feet) in building area. It is classified as a medium hazard industrial occupancy, and according to Article 3.2.2.55. or 3.2.3.20. of the Building Code it must be of non-combustible construction, fully sprinklered with the floor assemblies having a three hour fire resistance rating.

   The applicant has connected two trailer units to the existing building by an enclosed combustible walkway 8' wide by 38' in length. The trailers are intended to be used by employees for locker storage and change rooms.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the sufficiency of compliance with the technical requirements of Article 3.2.2.55. or 3.2.3.20. of the Building Code. At issue is the

determination of whether the walkway and two trailers attached to the existing sprinklered building must be also protected by a sprinkler system or whether a non combustible walkway separated from the building by not less than 45 min. fire separation must be constructed.

4. **Provision of the Building Code**

Article 3.2.2.55.: Industrial Buildings, Division 2, Any Height, Any Area, Sprinklered

1. A building classified as Group F, Division 2 shall conform to Sentence (2) provided the building
    a. is not limited in building height,
    b. is sprinklered, and
    c. is not limited in building area.
2. The building shall be of noncombustible construction, and
    a. floor assemblies shall be fire separations with a fire-resistance rating of not less than 3 h,
    b. mezzanines shall have a fire-resistance rating of not less than 1.5 h,
    c. roof assemblies shall have a fire-resistance rating of not less than 1.5 h, (see Article 3.2.2.12. for supervised sprinkler systems) and (d)all loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

Article 3.2.3.20.: Walkway between Buildings

3. Except as provided in Sentence 3.2.3.21.(2), where buildings are connected by a walkway, each building shall be separated from the walkway by a fire separation with a fire-resistance rating of not less than 45 min.
4. Except as provided in Sentence (3), a walkway connected to a building required to be of noncombustible construction shall also be of noncombustible construction.
5. A walkway connected to a building required to be of noncombustible construction is permitted to be of heavy timber construction provided
    a. not less than 50 per cent of the area of any enclosing perimeter walls is open to the outdoors, and
    b. the walkway is at ground level.
6. A walkway of noncombustible construction used only as a pedestrian thoroughfare and that is not required as an exit, need not conform to the requirements of Articles 3.2.3.14. and 3.2.3.15.

5. **Applicant's Position**

   The Applicant submitted that the trailers are intended for temporary use and are only required until June 30, 1995. Therefore, an alteration to the existing sprinkler system should not be required.

6. **Chief Building Officials Position**

   The Respondent submitted that where an addition is proposed to an existing building,the addition shall be designed in accordance with the requirements of the entire building. Therefore, the trailer addition must be sprinklered.

   The respondent does not have the authority to permit a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that the existing temporary combustible walkway from the trailers to the main building provides sufficiency of compliance with the Building Code.

8. **Reasons:**
   a. The connecting walkway is temporary. A $10,000 bond has been placed with the municipality to demolish it by June 30, 1995.
   b. The area of the walkway relative to the building is very small; approximately 0.3% of the building area.
   c. There are no unprotected openings at the building's wall facing the walkway.
   d. The walkway is separated from the building by steel doors having self closing devices.
   e. The building has 24 hr security with mandatory 1 hr frequency inspections along the entire facility. The plant is also in operation 24 hrs.

Dated at Toronto, this 25th day, in the month of April, in the year 1995, for application number 1995-15.

APPEARANCES

Mr. Andrew M. Bousfield, Principal
Andrew Bousfield Architects
Suite 422
77 Mowat Avenue
Toronto, Ontario
For the Respondent

RULING

1. **The Applicant**

   Mr. Denny Cybalski, Cyden Investment Inc. is an applicant for a permit under the Building Code Act, 1992 to construct a four storey building for office and retail use at 255 King Street North, Waterloo, Ontario.

2. **Description of Constrution**

   The subject building is a four storey building designed for restaurant, office and retail use. The first storey is designed for restaurant and retail use while the upper three storeys are to be used for offices.

   The building faces 3 streets and is fully sprinklered. The subject ground floor area is 1022 m². There are two fire hose cabinets on the ground floor level.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the sufficiency of compliance with the technical requirements of Clause 3.2.9.1.(1)(a) and Sentence 3.2.9.4.(1) of the Building Code. At issue is whether additional fire hose cabinets are required to protect the ground floor retail units.

4. **Provision of the Building Code**

   Clause 3.2.9.1.(1)(a): Standpipe and Hose Systems

1. Except as provided in Article 3.2.9.2., a standpipe and hose system shall be installed in every building that
    a. is more than
        i. 3 storeys in building height, or
        ii. 14 m in height measured between grade and the ceiling of the uppermost storey,

Sentence 3.2.9.4.(1): Hose Stations and Cabinets

2. Hose stations shall be located
    a. so that every portion of the building can be reached by a hose stream and is within 3 m (9 ft 10 in) of a nozzle attached to not more than 30 m (98 ft 5 in) of hose,
    b. not more than 5 m (16 ft 5 in) from every required exit serving a floor area, except
        i. for the first storey, or
        ii. where additional hose stations are required to achieve full coverage of the floor area, and
    c. in a conspicuous location where they are not likely to be obstructed.

5. **Applicant's Position**

The Applicant stated that the ground floor area is provided with two fire hose cabinets.

The Applicant submitted that the ground floor retail units in question are provided with adequate provision for fire fighting without the need for additional fire hose cabinets due to the following:

i. The building is fully sprinklered.
ii. The building is provided with a fire alarm system.
iii. The ground floor is directly accessible by a fire route that conforms to Clauses 3.2.5.6.(2)(b)&(c) of the Building Code.
iv. The building is located within 1 kilometre of a constantly attended fire hall.

6. **Chief Building Officials Position**

The Respondent submitted that fire hose cabinets are required in conformance with Subsection 3.2.9. of the Building Code.

The Respondent submitted that the second, third and fourth floors are protected by the required number of fire hose cabinets. The owner does not wish to provide additional fire hose cabinets that are accessible by each suite on the first floor retail level.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that not providing additional fire hose cabinets on the ground floor provides sufficiency of compliance with the Building Code.

8. **Reasons:**

   . The building is fully sprinklered.

   a. Only a portion of the ground floor is not reachable by a 30 m fire hose from the hose stations.

   b. Each retail unit has direct access from the exterior for firefighting capabilities.

   c. The ground floor is highly compartmentalized and separated from the floor above by a 2 hour rated fire separation.

   d. The area affected is very small compared to unsprinklered allowable areas identified in Table 3.2.9.A.

APPEARANCES

Mr. A. Jasinevicius
Area Manager of Inspections
City of Toronto
For the Respondent

RULING

1. **The Applicant**

   Mr. David Markowitz, Markio Designs Inc. is the holder of a permit under the Building Code Act, 1992 to complete renovations to the CAPEZIO retail store at Hazelton Lanes, 87 Avenue Road, Toronto, Ontario.

2. **Description of Constrution**

   The CAPEZIO retail store (i.e. unit #267) was renovated by the owner. The unit is located in a six storey mixed use commercial building. The unit is situated at the corner of three major cross aisles on the upper level of a two storey interconnected floor space, which is separated from the residential floors by a fire separation with a 2 hour fire resistance rating.

   Over 90% of the subject storefront faces the interconnected floor space. Entrance to the store is designed to remain open during the day. A glass bi-focal door is used to secure the entrance when the store is closed.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the technical interpretation of Clause 3.3.1.4.(1)(b), Articles 3.1.8.11. & 3.1.8.13. of the Building Code. At issue is whether proper door closure hardware is required for the fire separation between Unit #267 and the adjacent public corridor.

4. **Provision of the Building Code**

   Clause 3.3.1.4.(1)(b): Public Corridor Separations

1. Except as otherwise required in this Part, public corridors shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 1 h except that

   (b> no fire-resistance rating is required when the floor area is sprinklered and the corridor does not serve an institutional occupancy or a residential occupancy,

Article 3.1.8.11.: Self-Closing Devices

2. Except as provided in Sentences (2) to (5), every door in a fire separation shall be equipped with a self-closing device designed to return the door to the closed position after each use.
3. Self-closing devices need not be provided on doors to freight elevators and dumbwaiters.
4. In a building that is not more than 3 storeys in building height, except for doors from hazardous classrooms in elementary and secondary schools, self-closing devices need not be provided on doors that are located between a corridor providing access to exit from classrooms and the adjacent classrooms.
5. In a building that is not more than 3 storeys in building height, except for doors located in a dead-end portion of a corridor or in a corridor which serves a hotel, self-closing devices need not be provided on doors that are located between a public corridor and adjacent rooms or suites of Group D occupancy.
6. Self-closing devices need not be provided on doors that are located between sleeping rooms or a corridor and adjacent sleeping rooms where the doors are within a fire-compartment described in Sentence 3.3.3.7.(2).

Article 3.1.8.13.: Door Latches

Except as permitted in Subsection 3.3.3., every swing-type door in a fire separation shall be equipped with a positive latching mechanism designed to hold the door in the closed position after each use.

5. **Applicant's Position**

The Applicant submitted that the CAPEZIO unit represents a grey area with respect to the requirement to install proper door closure hardware for the fire separation between the unit and adjacent public corridor. There is only a 0.3 metre intrusion of the store front into the 5 metre wide public corridor. Over 90% of the store front falls outside of the 5 metre width.

The applicant submitted that the following points make Unit #267 consistent with the life safety standards intended in the Building Code:

i. The unit is on the corner and faces out towards a large 2 storey atrium;
ii. There are three cross aisles in front of the store and an approved sprinkler system with a public corridor adjacent to the store; and,
iii. The large atrium next to the store would act as a reservoir of space for smoke to gather and exhaust through its special exhaust system.

6. **Chief Building Officials Position**

The Respondent submitted that proper door closure hardware is required for the fire separation between Unit #267 and the adjacent public corridor.

The Respondent submitted that public corridors are required to be constructed as fire separations when the floor area is sprinklered and the public corridor is less than 5 metres wide. Since the public corridor walls are required to be fire separations, the doors must be equipped with self closing and latching devices. The Respondent submitted that hold open devices are an option that would permit the doors to be maintained in the open position during business hours.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that not providing self closing devices for the storefront door serving unit # 267 provides sufficiency of compliance with the technical requirements of the Building Code.

8. **Reasons:**

. Over 90% of the storefront faces a large atrium space with a dedicated exhaust system. The remaining portion of the storefront is only 0.3 m less than the required 5 m corridor width.
a. The municipality has permitted the stores facing the atrium to have doors without self closing devices.

Dated at Toronto, this 11th day, in the month of April, in the year 1995, for application number 1995-09.

APPEARANCES

Mr. Paul F. Svastal, Project Manager
Paul & Douglas Automatic Sprinklers Ltd.
Mississauga, Ontario
For the Applicant

RULING

1. **The Applicant**

   Mr. Ian Sunderland, PCL Constructors Eastern Inc. is the holder of a permit under the Building Code Act, 1992 to construct an eleven storey fully sprinklered office building that includes a city and inter-city bus terminal at 301 St. Paul Street (160 King St.), St. Catharines, Ontario.

2. **Description of Constrution**

   The subject building is an eleven storey fully sprinklered high-rise office building. A portion of the sprinklered ground floor consists of office areas, loading docks and truck maneourvering bays. The building also includes a city and inter-city bus terminal comprised of a donut shop, waiting area, ticket office and washrooms located between two bus lanes and a service lane. The bus terminal is an integral part of the building in that it is surrounded by the eleven storey office building.

   The bus terminal area consists of two open-end covered bus lanes and a service lane that are not sprinklered. The designer has based his sprinkler design on "Measure A" Fully Sprinklered Building, as detailed in Chapter Three of the Supplement to the National Building Code of Canada 1990, to satisfy the required smoke control measures as indicated in Subsection 3.2.6. of the Building Code.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the technical interpretation of Sentences 3.3.5.5.(8) and 3.2.5.13.(1) of the Building Code. At issue is whether sprinkler protection is required for the bus lanes drive through portion of a city and inter-city bus terminal attached to an eleven storey fully sprinklered high-rise office building.

4. **Provision of the Building Code**

Sentence 3.3.5.5.(8): Repair and Storage Garages

8. Except for open-air storeys, every storey of a storage garage or repair garage located below grade shall be sprinklered.

Sentence 3.2.5.13.(1): Automatic Sprinkler System

9. Except as provided in Sentence (2) and (3), where a sprinkler system is required, it shall be designed, constructed, installed and tested in conformance with NFPA 13, "Installation of Sprinkler Systems".

5. **Applicant's Position**

The Applicant submitted that sprinkler protection was not provided for the bus lanes and service lane because the Building Code does not require this protection and there are numerous identical projects that are not protected by a sprinkler system.

The Applicant submitted that the open-end covered bus lanes and service lane are considered an open-air storey and meet the 25% perimeter wall unenclosed criteria defined in Part 1 of the Building Code. In addition, the Applicant indicated that NFPA 13, 4-4.1.7.6. waives the required sprinklering where exterior roofs or canopies are constructed with non-combustible construction and no combustibles are stored or handled under the roofs or canopies.

6. **Chief Building Officials Position**

The Respondent submitted that the building will not be considered fully sprinklered unless the bus lanes are sprinklered. If the sprinklers over the bus lanes are omitted from the design, then the "Measure A" design will need to be re-evaluated.

The Respondent submits that the intent of Sentence 3.3.5.5.(8) of the Building Code is to address storage garages or repair garages not bus terminals. In a storage garage vehicles are parked and the engines are shut off. There is movement of vehicles only when the vehicles are entering and exiting the garage. The only movement of people consists of people going to and from the vehicles and few people, if any, will be sitting in an idling vehicle.

In addition, the first floor of this building is not an open air storey because less than 25% of the perimeter wall of this storey is open to the out doors in a manner that will provide cross ventilation.

The Respondent further submitted that the bus terminal operation will be quite different from the operation of a storage garage. The buses will be stopped for a few minutes at a time with their engines running and then they depart and are replaced by other buses.

The St. Catharines Transit Commission anticipates that the engines on the buses will never be turned off. The buses are diesel powered. Diesel engines are more efficient when kept running. People will be moving to and from constantly as they seek out their bus and people will be sitting in the idling buses as they wait for their bus to depart.

The Respondent reported that the Applicant wishes to use the exception for sprinklers provided for in N.F.P.A. 13, Sentence 4-4.1.7.5. "Spaces under Ground Floors, Exterior Docks and Platforms", which states:

"Exception: Sprinklers shall be permitted to be omitted when all of the following conditions prevail;

. The space is not accessible for storage purposes and is protected against accumulation of wind-borne debris;
a. The space contains no equipment such as steam pipes, electric wiring, or conveyors;
b. The floor over the space is of tight construction;
c. No combustible or flammable liquids or materials that under fire conditions may convert into combustible or flammable liquids are processed, handled, or stored on the floor above the space".

The Respondent submitted that this exception is not available to the Applicant in this case for the following reasons:

4. In the context of the NFPA, the term space is used as the most general term to describe an area of a building. When the NFPA seeks to describe a particular type of space (i.e. a space for which a particular function can be described) a more specific term is employed, such as "compartment", "floor area", or "small room". "Space" is employed to denote an area of a building which people enter rarely if at all.

The exception itself supports this interpretation of the term "space". The exception requires that the space be inaccessible for storage and that it contain no equipment such as steam pipes, electrical wiring, or conveyors. This implies an empty area or void in a building. The term does not imply an area in which people are present and activities are carried out.

It is clear that the term " Concealed Space" as it appears in Section 4-4.1.7.1. refers to "spaces" as areas in which human activity will take place.

5. The Respondent submitted that its interpretation of the exception is supported by the title of the Sentence in which the exception appears. "Exception: Spaces under Ground Floors, Exterior docks and Platforms". It is highly unlikely that any activity is going to take place underneath a loading dock or a platform.
6. The Respondent submitted that this section was intended to address situations such as:
    a. A space is created between the ground floor of a building and the ground itself for the location of duct work and plumbing.
    b. A space is created under an exterior loading dock.
    c. A space is created under a platform. (For example, in a retail store where there is an area which is essentially a raised area of the floor where the management offices of the store are housed... a grocery store. The area between the floor of the platform and the floor of the building is the space contemplated by this exception).
7. The Respondent submitted that the reference in the exception to the exterior loading dock indicates that the exception is intended to be read narrowly. Without this exception a dock which extends out from a building and is exposed to the weather, would be required to be sprinklered.
8. The area that the Applicant contends is a space will contain electrical wiring so the exception cannot apply.
9. The bus lanes are at grade. There is no space under the ground floor which is the floor of the bus lanes.

The Respondent noted that the Applicant proposes to sprinkler the truck maneourvering bay located to the south of the service lane which seems to be the same sort of area as the bus lanes.

The Respondent submitted that not sprinklering the bus lanes will compromise the safety of the occupants of the office tower in that the smoke control measures as required in the Building

Code have not been provided. The potential of a fire in the bus lanes is far greater than in any other part of the building since there will be twelve buses each carrying approximately 100 gallons of diesel fuel moving in and out of this confined area every 15 minutes.

None of the alternative smoke control measures required by Section 3.2.6 of the Building Code have been employed in the design of this building, therefore smoke from a fire in the bus lanes may penetrate the office tower.

In conclusion, the Respondent submitted that the Building Code requires the two bus lanes, the service lane and the platform area to be sprinklered in order to comply with 3.2.6. "Additional Requirements of High Buildings".

2. **Commission Ruling:**

   In favour of the Respondent. It is the decision of the Building Code Commission that Sentence 3.3.5.5.(8) is not applicable to the Bus Terminal.

3. **Reasons:**

   Sprinkler protection is required because of "Measure A" high rise requirements. NFPA-13, Article 4-4.1.7.5 is not relevant to this issue. NFPA Sentence 4-4.1.7.6.1 applies without the exception because combustibles will be handled in the Bus Terminal.

Dated at Toronto, this 6th day, in the month of April, in the year 1995, for application number 1995-08.

For the Applicant

RULING

1. **The Applicant**

   Mr. Ross Smith, AON Builders Inc. is the holder of a permit under the Building Code Act, 1992 to construct six multi residential condominium townhouse buildings at River Park Village Condominiums, 1121 Armour Road, Peterborough, Ontario.

2. **Description of Constrution**

   The River Park Village Condominiums is a multi residential townhouse project comprising six buildings. The project includes two 6 unit rowhouses, three 7 unit rowhouses and one 8 unit rowhouse. The buildings range in building area from 1100 m² to 1492 m².

   Each dwelling unit is served by it's own two car garage. There is no dwelling unit above another dwelling unit.

   The building is designed to conform to the requirements of Article 3.2.2.34. of the Building Code. This permits the building to be combustible construction and unsprinklered, provided the building area does not exceed 1800 m². All six buildings fall within this limit.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical interpretation of Article 3.3.5.7. of the Building Code. At issue is whether the construction between the garages and the dwelling units may conform to Sentence 9.10.9.16.(3) of the Building Code instead of the required 1.5 hour fire separation.

4. **Provision of the Building Code**

   Article 3.3.5.7.: Storage Garage Separation.

A storage garage shall be separated from other occupancies by a fire separation with a fire-resistance rating of not less than 1.5 h.

5. **Applicant's Position**

The applicant submitted that Article 3.3.5.7. of the Building Code was written for the purposes of multi-car parking garages. In this case each dwelling unit is served by it's own garage. Overall conditions are similar to the provisions on Part 9 (i.e. Article 9.10.9.16. and 9.10.13.15.).

During the hearing the applicant indicated that he would provide a fire separation with a 1 hour fire resistance rating between each individual garage and the dwelling unit.

6. **Chief Building Officials Position**

The respondent submitted that the buildings are regulated by Part 3 of the Building Code. Accordingly, Article 3.3.5.7. applies.

The respondent does not have the authority to permit a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that providing a fire separation with 1 hour fire resistance rating between each garage and the attached dwelling unit provides sufficiency of compliance with Article 3.3.5.7. of the Building Code.

8. **Reason:**

The layout and construction of the blocks of townhouses lend themselves more to the application of Part 9 of the Building Code. However their building areas were substantially larger than Part 9 limits.

Dated at Toronto, this 6th day, in the month of April, in the year 1995, for application number 1995-13.

City of Kanata
For the Respondent

RULING

1. **The Applicant**

   Mr. Gary Sharp, Post Harvest Developments Inc. is the holder of a permit under the Building Code Act, 1992 to construct a single family dwelling (i.e. house) at 1423 Houston Crescent (Lot 9, Plan 4M-849), Kanata, Ontario.

2. **Description of Constrution**

   A pre-manufactured, site assembled high thermal mass masonry heater is proposed to be constructed in the subject house. The heater is completely different internally than a conventional masonry fireplace. The core of the heater is built of pre-cast, interlocking components that form the firebox and heat transfer passages. Also, combustion air is not provided from outdoors, the throat of the fireplace does not contain a damper and there are numerous 90 degree turns in the combustion chamber.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical interpretation of Section 9.22., specifically, Articles 9.22.1.4. & 9.22.7.1. of the Building Code. At issue is whether the high mass radiant masonry heater provides sufficiency of compliance with the masonry fireplace provisions in the Building Code.

4. **Provision of the Building Code**

   Section 9.22. Fireplaces

Article 9.22.1.4. Combustion Air

1. Except as permitted in Article 9.22.1.5. and 9.22.1.6., every fireplace, including a factory-built fireplace, shall have a supply of combustion air from outdoors in accordance with Sentence (2) to (12).
2. The combustion air shall be supplied by a noncombustible and corrosion-resistant supply duct.
3. The combustion air shall be supplied by a noncombustible and corrosion-resistant supply duct.
4. The supply duct shall have
    a. a diameter of at least 100 mm (4 in) or an equivalent area,
    b. an exterior intake for entry of air from the outdoors, and
    c. an interior outlet for providing air for the fire chamber.
5. The supply duct shall contain a tight-fitting damper that shall be located close to the interior outlet and be operable from the room containing the fireplace.
6. The operating mechanism shall clearly indicate the actual position of the damper.
7. The interior outlet shall,
    a. be located as close as possible to the opening in the face of the fireplace.
    b. be designed to prevent embers from entering the supply duct, and
    c. where it is placed inside the fire chamber, be located at the front centre of the fire chamber hearth and be equipped with a noncombustible hood.
8. The exterior intake shall be protected against the entry of rain and direct wind and have an insect screen of corrosion-resistant material.
9. Where the exterior intake is located above the level of the fire chamber hearth, the interior outlet shall be located at a level at or below the level of the hearth.
10. Where the interior outlet is located in the fire chamber and the exterior intake is located at or below the level of the fire chamber hearth, the supply duct shall be installed with a minimum clearance from combustible material of 50 mm (2 in) for a distance of 1 m (3 ft 3 in) measured from the outlet.
11. Where the interior outlet is located in the fire chamber hearth and the exterior intake is located above the level of the fire chamber hearth, the supply duct shall be installed with a minimum clearance from combustible material of,
    a. 50 mm (2 in) for a distance of 1 m (3 ft 3 in) measured from the outlet, and
    b. 25 mm (1 in) for the remainder of the supply duct to the intake.
12. The exterior intake shall be located to avoid being blocked by snow or fallen leaves.

13. Where the supply duct is exposed to a heated space, the duct shall be insulated to provide a thermal resistance of not less than RSI 1.4 (R 8).

Article 9.22.7.1. Slope of Smoke Chamber

The sides of the smoke chamber connecting a fireplace throat with a flue shall not be sloped at an angle greater than 45° to the vertical.

5. **Applicant's Position**

The applicant submitted that masonry heaters are not addressed by the Building Code. The internal operation of a high thermal mass masonry heater is completely different than a conventional fireplace. Masonry heaters take advantage of tonnes of mass in the form of bricks or stone to store and later release the heat they produce.

The applicant stated that although the masonry heater design does not comply with some of the prescriptive requirements for fireplaces in Section 9.22, test data and past experience indicate sufficiency of compliance with the performance level intended for conventional fireplaces in the Building Code.

6. **Chief Building Officials Position**

The respondent submitted the following comments concerning the installation of a high thermal mass masonry heater:

a. The combustion air supply duct does not satisfy Article 9.22.1.4. of the Building Code. The supply duct does not provide a tight fitting damper as required and its location does not prevent embers from entering the supply duct.
b. The smoke chamber does not satisfy Article 9.22.7.1. of the Building Code. The sides of the smoke chamber connecting the throat with the flue exceeds the 45 degrees to the vertical maximum.

   The schematic drawing and assembly manual clearly indicates that the flue gasses, once in the secondary chamber, must make numerous 90 degree turns before entering the chimney.

c. Draft: The respondent questioned whether the down draft design would provide sufficient draft to start a fire or to exhaust gases when the fire is in its final burning stages.

d. Creosote: There may be creosote that does not get fully consumed and therefore is deposited in the secondary combustion chamber, side flue collection manifolds and lower manifold under the hearth.
e. Maintenance: The collection manifold appears to be fully enclosed with no access for visual inspection or ability to perform regular maintenance. This may lead to inefficient operation of the heater.
f. Design Criteria: The respondent questioned the design criteria of the flue size, chimney height, etc. The applicant did not provide evidence of approval by any recognized testing agencies or design standards such as CAN/CSA A-405-M87 "Design and Construction of Masonry Chimneys and Fireplaces".
g. The information provided by the applicant indicates that the heater produces hotter fires and retains more heat than conventional masonry fireplaces. Therefore, caution must be taken with respect to clearance from combustibles.

7. **Commission Ruling:**

In favour of the Respondent. It is the decision of the Building Code Commission that this pre-manufactured, site assembled, high thermal mass masonry heater does not conform to the present requirements of the Building Code.

8. **Reasons:**

. The Building Code does not address engineered, pre-manufactured, site assembled high thermal mass masonry heaters.
a. The documentation provided by the applicant is insufficient for the Commission to formulate conclusions regarding sufficiency of compliance with the Building Code.
b. An application to the Building Materials Evaluation Commission is recommended.

Dated at Toronto, this 13th day, in the month of March, in the year 1995, for application number 1995-01.

APPEARANCES

Mr. James McLellan, Owner/Builder
St. Catharines, Ontario
For the Applicant

Mr. John Fisher
Chief Building Official
City of St. Catharines
For the Respondent

RULING

1. **The Applicant**

   Mr. James McLellan, Owner/Builder is the holder of a permit under the Building Code Act, 1992 to construct an attached carport on the south east side of an existing one storey dwelling at 29 Victoria Street, St. Catharines, Ontario.

2. **Description of Constrution**

   A building permit was issued in 1993 to construct an attached carport, 4.3 m (14 ft.) wide and 7.3 m (24 ft.) long, on the south east side of an existing one storey house. The plans that formed the basis of the building permit issuance showed the carport open at both ends and one side. Approval was given during construction to install an overhead door that increased the enclosed perimeter to 50%. The carport was then further enclosed by the owner with 6 mil poly. This increased the enclosed perimeter from 50% to 68%.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the technical interpretation of Article 9.35.2.1. of the Building Code. At issue is whether enclosing more than 60% of the carport perimeter with 6 mil poly and an overhead door requires the carport to be considered as a garage.

4. **Provision of the Building Code**

   Article 9.35.2.1. Roofed Enclosure Considered as Garage

Where a roofed enclosure used for the storage or parking of a car or cars has more than 60 per cent of the total perimeter enclosed by walls, doors or windows, the enclosure shall be considered a garage.

5. **Applicant's Position**

The applicant submitted that the rear wall of the carport is temporarily closed off during the winter months with a roll down sheet of 6 mil poly to prevent snow accumulation and damage.

The applicant does not consider this to be a violation of the Building Code.

The Building Code states that a carport perimeter cannot be enclosed in by more than 60% with walls, doors or windows. The applicant submitted that a wall is a permanent structure composed of wood framing, sheathing and exterior cladding.

6. **Chief Building Officials Position**

The respondent submitted that enclosing part of the carport perimeter with 6 mil poly is considered a material alteration since Clause 9.10.9.16.(3)(a)&(b) and Sentence 9.10.13.15.(1)&(2) of the Building Code require the following to ensure the safety of the occupants of the dwelling:

- the construction between the garage and the dwelling must provide as effective barrier to gas and exhaust fumes and
- every door between the garage and dwelling unit must be tight-fitting and weatherstripped to provide an effective barrier against the passage of gases and exhaust fumes and must be fitted with a self-closing device and
- a doorway between an attached or built-in garage and a dwelling unit must not be located in a room intended for sleeping.

The gas-tight barrier between a dwelling unit and an attached garage is intended to provide reasonable protection from carbon monoxide and gasoline fumes from entering the dwelling unit. Carbon monoxide is a colourless odourless gas that is highly poisonous when inhaled.

The applicant submitted that making a material alteration to a building is by definition, performing construction and Subsection 8 (1) of the building Code Act states that "No person shall construct - unless a building permit has been issued therefore by the Chief Building Official". To date no building permit has been applied for nor issued.

On January 11, 1995, an inspection of the site revealed that the rear wall of the carport was enclosed with 6 mil poly. This increases the percentage of the perimeter that is enclosed from 50% to 68%.

According to Funk and Wagnalls Canadian College Dictionary, a wall is "a continuous structure designed to enclose an area". The poly is designed to enclose an area to keep the snow and wind out, to act as a wall. This wall of poly, which is designed to keep the snow and wind out will keep the poisonous carbon monoxide in.

The applicant states that the 6 mil poly installed at the west end of the carport is only in place during the winter months, December to March. This is not a valid reason for not requiring the wall between the garage and the dwelling and to be constructed as a barrier to gas or exhaust fumes. There is always the possibility of the build up of carbon monoxide and it could seep into the dwelling even if the wall was only in place one day a year.

7. **Commission Ruling:**

In favour of the Respondent. It is the decision of the Building Code Commission that enclosing more than 60% of the carport perimeter with 6 mil poly and an overhead door constitutes a garage in accordance with Article 9.35.2.1. of the Building Code.

A free standing snow screen may be installed no closer than 450 mm (18") from the rear of the carport.

8. **Reason:**

The installation of 6 mil poly on the rear wall of the carport limits the ventilation of the space and would require conformance to Article 9.10.13.15. and Article 9.10.9.16. of the Building Code.

Dated at Toronto, this 13th day, in the month of March, in the year 1995, for application number 1994-16.

BCC Ruling No. 95-09-429

BUILDING CODE COMMISSION DECISION ON B.C.C. #95-09-429

APPEARANCES

Mr. John O'Byrne
Bracebridge, Ontario
For the Applicant

Mr. Mike Gooch
Building Inspector
Town of Bracebridge
For the Respondent

RULING

1. **The Applicant**

   Mr. & Mrs. D. Wright are holders of a permit under the Building Code Act, 1992 to construct a single family dwelling (i.e. house), 1 Moreland Court, Bracebridge, Ontario.

2. **Description of Constrution**

   The rise of the wood stairs connecting the first and second floor of the subject house exceeds the maximum 200 mm height. The actual rise of the staircase in question is 208 mm.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical interpretation of Article 9.8.3.1. of the Building Code. At issue is whether the proposed additional handrail and improved lighting condition will provide sufficiency of compliance with the maximum stair rise requirement of 200 mm.

4. **Provision of the Building Code**

   Article 9.8.3.1. Rise and Run of Stairs

   1. Except for stairs to areas used only as service rooms, interior stairs within dwelling units and exterior stairs serving dwelling units shall have a maximum rise of 200 mm (7E in), a minimum run of 210 mm (8¼ in) and a minimum tread width of 235 mm (9¼ in).

2. Except for stairs serving not more than 1 dwelling unit, interior stairs not contained within dwelling units and exterior stairs for buildings shall have a rise of not more than 200 mm (7E in) and not less than 125 mm (4E in).
3. Stairs referred to in Sentence (2) shall have a minimum run of not less than 230 mm (9 in), or not more than 355 mm (14 in) and a tread width of not less than 250 mm (9E in).

5. **Applicant's Position**

The applicant submitted that the rise of the staircase in question is 208 mm and not 200 mm. Therefore, the Chief Building Official determined the stairs deficient and will not issue an occupancy permit.

The applicant stated that a set of stairs built to meet the rise and run requirements of the Building Code would not fit into it's intended location in the house. The problem arose from the fact that the basement stairs were already in place. The placement of the lower basement stairway made it impossible to construct the upper stairway with the required rise and headroom.

The applicant submitted that the stairs are structurally sound and have been in use for two and one half years without any mishap or injury.

The applicant proposed that if the following work was under taken the stairway would sufficiently comply with the Building Code:

a. addition of a handrail on the wall side of the stairs;
b. improve the lighting in the area of the stairway by adding fixtures on the wall of the of the stairs; and,
c. bevel the top corner of each tread nosing.

6. **Chief Building Officials Position**

The respondent submitted that the rise of the stairs is approximately 8 mm in excess of the maximum permitted rise of 200 mm.

The respondent does not have the authority to accept a deviation from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that the stair shows sufficiency of compliance with the Building Code provided handrails are installed on both

sides of the stair and improved lighting is provided of at least 100 Watts (incandescent) or equivalent on each run and to be activated in accordance with Sentence 9.34.2.3.(2) of the Building Code.

8. **Reason:**

It is the opinion of the Building Code Commission that a small deviation (4%) in the maximum riser height can be compensated by installing an additional handrail on the wall side of the stair and by improving the lighting for the stairway.

Dated at Toronto, this 13th day, in the month of March, in the year 1995, for application number 1995-06.

RULING

1. **The Applicant**

   Mr. Robert Fallowfield, Aluma Systems Canada Inc. is the applicant for a permit under the Building Code Act, 1992 to erect temporary grandstand structures for the Molson Indy at the Exhibition Grounds, Toronto, Ontario.

2. **Description of Constrution**

   The subject structure is a modular steel temporary grandstand to be erected on the Exhibition Grounds in the City of Toronto for the viewing of the annual Molson Indy Races. The grandstand is approximately 82.3 m (270 ft) long by 20.9 m (68.7 ft) wide. It has 33 rows of bleachers and seating capacity for 5044 people.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the technical interpretation of Article 4.1.1.4., Sentences 4.1.10.5.(1) & 4.1.10.5.(2) of the Building Code. At issue is whether horizontal bracing members are required to resist horizontal live loads for temporary grandstand structures at the Exhibition Grounds, Toronto, Ontario.

4. **Provision of the Building Code**

Article 4.1.1.4. Design Basis

1. Buildings and their structural members shall be designed by one of the following methods,
    a. standard design procedures and practices provided by this Part and any standards and specifications referred to therein, except in cases of conflict the provisions of the Building Code shall govern; or
    b. one of the following three bases of design,
        i. analysis based on generally established theory,
        ii. evaluation of a given full-scale structure or a prototype by a loading test,
        iii. studies of model analogues, provided the design is carried out by a person qualified in the specific method applied and provided the design ensures a level of safety and performance at least equivalent to that provided for or implicit in design carried out by the methods referred to in Clause (a).
2. Communications towers, dish antennas and their supporting structures shall conform to CAN3-S37, "Antennas, Towers, and Antenna Supporting Structures".

Sentences 4.1.10.5.(1) & 4.1.10.5.(2)Resonances and Sway Forces

3. Where the fundamental vibration frequency of a structural system supporting an assembly occupancy used for rhythmic activities, such as dancing, concerts, jumping exercises or gymnastics, is less than 6 Hz, the effects of resonance shall be investigated by means of a dynamic analysis.
4. The floor assembly and other structural elements that support fixed seats in any building used for assembly occupancies to accommodate large numbers of people at one time, such as grandstands, stadia and theatre balconies, shall be designed to resist a horizontal force equal to at least 0.3 kN (70 lb) for each metre length of seats acting parallel to each row of seats, and at least 0.15 kN (35 lb) for each metre length of seat acting at right angles to each row of seats, assuming such forces to be acting independently of each other.

5. **Applicant's Position**

The applicant submitted that all vertical bays of the grandstand are designed independently to resist the sway and wind loads identified in the Building Code.

The Building Code specifies the vertical and lateral loads for which these grandstand structures must be capable of resisting. Those loads are dead load of the structure, 100 psf vertical live load due to people, horizontal wind load and horizontal sway load.

The vertical legs of the grandstands are braced with vertical diagonal bracing in every bay, eliminating the need to carry load horizontally across a bay.

The grandstand structures will be erected with sufficient vertical bracing in every bay to meet the Building Code. Therefore, the bracing required by the City of Toronto Building Department is not necessary.

6. **Chief Building Officials Position**

The respondent submitted that the proposed bleacher/grandstand structure has a natural frequency in the sway mode of 1HZ to 3HZ, therefore the dynamic behaviour of the proposed structure is a factor in its design. Dynamic behaviour is influenced by the stiffness rather than the strength of the structure. The applicant's structural analysis does not address this issue of dynamic behaviour as required in Sentence 4.1.10.5.(1) of the Building Code.

Inadequate horizontal bracing is proposed. This could result in the deterioration of the bleacher/grandstand structure due to the severe forces created through the dynamic sway when people begin to move. Research by Professor Jim Dickie of the University of Manchester found that the sway characteristic of the rear frames deteriorates as the height of the bleachers/grandstand increases.

An alternative to this is to make the frames sufficiently rigid through the use of vertical bracing. This however causes uneven loading in the supporting legs which in turn brings a risk of differential settlement. The settlement problem can be avoided through the use of foundations that have been designed for these forces but due to the temporary nature of the structure the owners of the site may not permit such a large undertaking.

In addition to the question of dynamic behaviour, it was found that the applicant failed to submit with their computer analysis sufficient supporting documentation. The documentation is required to explain the concept/theory behind both the software and modelling used in analysing the frames. This information is required to see if the requirements of Article 4.1.1.4. of the Building Code are met.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that appropriately designed diagonal vertical bracing at every bent in both directions to resist the loads identified in Article 4.1.10.5., complies with the Building Code requirements provided proper foundations are designed as per Part 4.

8. **Reason:**

   Horizontal bracing is not specifically required by the Building Code as long as the structure is shown to resist the applicable loading by analysis based on generally established theory.

Dated at Toronto, this 28th day, in the month of February, in the year 1995, for application number 1995-03.

RULING

1. **The Applicant**

   Mr. Stephen Lim, Cederland Properties, Market Village is the applicant for a permit under the Building Code Act, 1992 to install electromagnetic locking devices on access to exit and exit doors required to be equipped with door release devices, at 4394 Steeles Avenue East, Markham, Ontario.

2. **Description of Construction**

   The applicant proposed to construct a private club within a section of an existing two storey building. The total floor area of the club is approximately 1860 m². The ground floor lounge is 360 m² and open to the public. The second floor of the club is for private functions.

   The building is fully sprinklered and has a single stage fire alarm system and emergency lighting system. The club is classified as a Group A, Division 2 occupancy. The occupant load for the club is in excess of 100 persons.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the technical interpretation of Sentence 3.3.1.12.(1), and Sentences 3.4.6.15.(1), 3.4.6.15.(3) & 3.4.6.15.(4) of the Building

Code. At issue is whether the proposed electromagnetic locking devices are permitted on access to exit and exit doors required to be equipped with door release devices.

4. **Provision of the Building Code**

Sentence 3.3.1.12.(1): Doors

(1) Every door that opens into or is located within a public corridor or other facility that provides access to exit from a suite shall

a. be not less than 800 mm (2 ft 7 in) wide where there is only one door leaf
b. have no single leaf in any multiple leaf door less than 600 mm (23D in) wide
c. not open onto a step, and
d. be readily openable in travelling to an exit without requiring keys, special devices or specialized knowledge of the door opening mechanism, except as permitted in Sentences (2) and (3).

Sentence 3.4.6.15.(1): Door Release Hardware

(1) If a door is equipped with a latching mechanism, a device that will release the latch and allow the door to swing wide open when a force of not more than 90 N (20 lb) is applied to the device in the direction of exit travel shall be installed on

e. every exit door from a floor area containing a Group A occupancy having an occupant load of more than 100 persons,
f. every door leading to an exit lobby from an exit stair shaft, and every exterior door leading from an exit stair shaft in buildings having an occupant load of more than 100 persons, and
g. every exit door from a floor area containing a Group F, Division 1 occupancy.

(3) Locking, latching and other fastening devices on any required exit door shall be such that the door can be readily opened from the inside without requiring keys, special devices or specialized knowledge of the door opening mechanism, except that this requirement does not apply to locking, latching and other fastening devices described in Sentence (4) or to doors designed to be remotely released in conformance with Article 3.3.1.12. serving a contained use area or an impeded egress zone.

(4) An electromagnetic locking device that does not incorporate latches, pins or other similar devices to keep the door in the closed position is permitted to be installed on an exit door, other than an exit door serving an elementary or secondary school or leading directly from a Group F, Division 1 occupancy

h. if the building is equipped with a fire alarm system conforming to Subsection 3.2.4.,
i. if the locking device is installed as an ancillary device to the fire alarm system and releases immediately
    I. upon activation of the fire alarm signal,
        i. where the exit door serves a hotel, upon activation of the alert signal where a two stage fire alarm system is installed or upon activation of the alarm signal where a single stage fire alarm system is installed,
    II. in the event of a power failure or ground fault, and
    III. upon actuation of a manually-operated switch accessible only to authorized personnel,
j. if a manual pull station for the fire alarm system is located on the wall not more than 600 mm (23% in) from the door,
k. if, upon its release, the locking device must be reactivated manually by the actuation of the switch referred to in Subclause (b)(iii),
l. if a legible sign having the words EMERGENCY EXIT UNLOCKED BY FIRE ALARM is permanently mounted on the door, and
m. if the lettering on the sign required in Clause (e) is at least 25 mm (1 in) high with a 5 mm (3/16 in) stroke.

5. **Applicant's Position**

The applicant submitted that Sentences 3.3.1.12.(3) and 3.4.6.15.(1) of the Building Code do not prohibit an electromagnetic locking device on a door having a release device required by Sentence 3.4.6.15.(1).

The applicant submitted that Building Code Commission decision No. 91-10-320 made on August 29, 1991 clearly states that electromagnetic locking devices are permitted on doors required to have door release hardware. Item 1 in Attachment "A" of the Ruling states "in the first instance all doors shall comply to Code conforming locking, latching, releasing and/or any other required hardware, however, in addition electromagnetic locking devices are permitted to be installed as per Code requirements and these do not negate other locking, latching or release hardware as required elsewhere in the Code."

The NFPA 101 Committee commentary on 5-2.1.7.4. of NFPA 101 "Life Safety Code" states that it is the intent of the Code to allow the use of electromagnetic locking devices where door release hardware is required.

Evacuation in a fire emergency is generally prompted by an alarm signal or verbal instruction. So by the time evacuees arrive at the egress doors equipped with panic hardware, the electromagnetic locking devices will already be disengaged so that only the mechanical latching mechanism is holding the door in the closed position. It is therefore the opinion of Leber/Rubes Inc. that the electromagnetic locking devices complying with the Code do not compromise the level of safety intended by the door release requirements of Sentence 3.4.6.15.(1) of the Code.

Based on the above, it seems clear that the Building Code Commission and the National Fire Protection Association (U.S.) do not view the electromagnetic locking devices in conjunction with door release hardware as a threat to life safety.

6. **Chief Building Officials Position**

The respondent submitted that a building permit cannot be issued for a condition that contravenes the Building Code. It is the respondents opinion that the installation of an electromagnetic locking device on a door required by Sentence 3.4.6.15.(1) to have door release hardware contravenes the Building Code. The door release requirements of Sentence 3.4.6.15.(1) supersede the electromagnetic locking device provisions of Sentence 3.4.6.15.(4).

Furthermore, Sentences 3.3.1.12.(1) and 3.4.6.15.(3) set out the general requirements for latching, locking and releasing of egress and exit doors. The respondent submitted that the allowance for electromagmetic locking devices referred to in Sentence 3.4.6.15.(3) applies to those doors that do not require door release hardware.

If electromagnetic locking devices were permitted on doors required to be equipped with door release hardware, then Sentence 3.4.6.15.(1) would contain specific references to Sentence 3.4.6.15.(4). As it does not, it is the respondent's opinion that electromagnetic locking devices are not permitted on doors required to be equipped with door release hardware.

The intent of providing door release hardware in these locations is to allow the unimpeded and immediate evacuation of high occupant loads where panic and crushing against egress doors is possible. Electromagnetic locking devices have the potential for delaying egress.

7. **Commission Ruling:**

   In favour of the Respondent. It is the decision of the Building Code Commission that the installation of electromagnetic locking devices on egress doors required to be equipped with release hardware does not comply with the requirements of the Building Code.

8. **Reasons:**
   a. Sentences 3.4.6.15.(1) and 3.4.6.15(4) operate independently. One does not preclude the requirements of the other. Allowing an electromagnetic locking device on such doors will defeat the purpose of installing a release hardware.
   b. Security concerns in such doors can be handled by other means or in combination with the door opening time delay features and signage provisions in Sentence 3.4.6.15.(6) provided the door release hardware identified in Sentence 3.4.6.15.(1) will release the magnetic locking devices installed on any access to exit and exit doors.

Dated at Toronto, this 28th day, in the month of February, in the year 1995, for application number 1995-02.

RULING

1. **The Applicant**

   Mr. John W. Bate, John Bate & Company. Ltd. is the holder of a permit under the Building Code Act, 1992 to construct a cold storage facility at 2660 Meadowpine Blvd., Mississauga, Ontario.

2. **Description of Constrution**

   The building comprises a two storey office and one storey cold storage facility. A firewall divides the building area into 2357.35 m² and
   3403.68 m² spaces. An automatic dry standpipe and hose system is proposed in the cold storage area.

3. **Dispute**

The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Sentence 3.2.9.3.(9) of the Building Code. At issue is whether the automatic dry standpipe and hose system proposed for the frozen space (-26 deg C) and other areas, sufficiently complies with the Building Code.

4. **Provision of the Building Code**

Sentence 3.2.9.3.(9): Standpipe and Hose System Design

(9) Where freezing of piping may occur, a dry standpipe system may be provided and so arranged through the use of listed devices to

a. automatically admit water to the system by opening of a hose valve, and
b. transmit a signal to an attended location.

5. **Applicant's Position**

The applicant proposed to use an automatic - dry system, normally filled with pressurized air that is arranged through the use of devices such as a dry pipe valve to automatically emit water into the system piping upon opening of a hose valve at a hose cabinet.

The City of Mississauga insists the applicant use a semiautomatic - dry system known as a pre-action system such that an electric pull station located in or at the fire hose station be activated in order to trip a deluge valve back at the riser. This also requires the user to manually turn a valve in the hose cabinet in order to have water at the hose. This involves two (2) actions to activate the system, a) pull the electric device in the hose cabinet, and b) open the valve.

The "pre-action" system is much more expensive than the auto-dry system.

The applicant submitted that Building Code Article 2.6.2.1. states that "in the case of a conflict between the provisions of this Code and those of a referenced document the provision of this Code shall govern". This means that NFPA 14 which is the reference document for Article 3.2.9.3., cannot overrule the provisions of that Article.

Sentence 9 of Article 3.2.9.3. sets the rules for standpipe systems "where freezing of piping may occur". It calls for the standpipe to "automatically emit water to the system by opening of a hose valve and transmitting a signal to an attended location". The system proposed by the applicant will conform to Sentence 3.2.9.3.(9).

In the applicant's opinion the pre-action system being required by the City of Mississauga has flaws, not the least of which, is the fact that a fire alarm pull station resides in each fire hose cabinet that will not necessarily be connected to the fire alarm system. The applicant is installing a fire alarm system in this building even though the Building Code does not require it. A person unfamiliar with this system seeing a pull station at the hose cabinet may think he is activating the fire alarm system when in effect he is activating the standpipe system.

6. **Chief Building Officials Position**

At the commencement of the hearing the Respondent raised a concern regarding one of the Building Code Commission panel member's hearing the dispute because of his involvement in a similar issue six years ago. The Respondent did not elaborate any further on the nature of these concerns.

The respondent stated that the use of a differential dry pipe sprinkler valve is not acceptable due to the following concerns:

1. NFPA - 14, which is referenced within Article 3.2.9.3. does not permit dry class 2 or 3 standpipe systems.
2. The National Fire Code of Canada does not permit dry standpipe systems for Class 2 and 3 service.
3. The 1.5 and 2.5 inch hose valves within the fire hose cabinets do not perform well in maintaining a seal against high air pressures.
4. There is no design criteria nor regulations with respect to the maximum volumes and trip times permitted.

   The system's volume has been estimated at 500 USGAL and the flow area of an 1.5 inch hose is estimated to be equivalent to a single flowing sprinkler head. What is considered an acceptable time to deliver water from the valve to the nozzle.

5. Typically a pressure of 40 - 50 psi will be maintained in the dry system to prevent tripping.

   The discharge of the air pressure along with the built up rust and scale deposits could create a hazard to personnel.

7. **Commission Ruling:**

The panel considered the representations of the respondent concerning the prior involvement of a Building Code Commission panel member in a similar issue and determined that the issues as presented by the Respondent would not raise a reasonable apprehension of bias on the part of the Building Code Commission panel. The panel therefore decided to continue with the hearing.

n favour of the Applicant. It is the decision of the Building Code Commission that the proposed automatic dry standpipe system complies with Sentence 3.2.9.3.(9) of the Building Code.

8. **Reasons:**
   . Sentence 3.2.9.3.(1) excepts sentence 3.2.9.3.(9) from the requirements of NFPA - 14.
   a. The proposed system complies with sentence 3.2.9.3.(9) of the Building Code.

RULING

1. **The Applicant**

   Mr. Michael Moxan, Dunlop Farrow Inc. Architects is the holder of a permit under the Building Code Act, 1992 to construct a new six storey Group D office building at 4342 Queen Street, Niagara Falls, Ontario.

2. **Description of Constrution**

   The subject building is a six storey Group D occupancy.

   The building height is 20.52 m from the ground floor level to the sixth floor level. It has a building area of approximately 2,800 m² and is fully sprinklered with an electrically supervised sprinkler system connected to the fire department by a central station facility. Article 3.2.2.41. of the Building Code requires the building to be of noncombustible construction and structural assemblies must have a 1 hour fire resistance rating. The building structure is reinforced concrete.

The second floor is open to the ground floor lobby. The second floor is provided with two enclosed exit stairs in the central core of the building and one exterior exit stair leading from an open-air patio/play area for a day care facility.

There is also an open stair which descends from the second floor corridor to the ground floor lobby. The stair ends at the ground floor level approximately 3 m from the doors leading to the exterior.

3. **Dispute**

The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Article 3.4.2.3., Sentences 3.4.4.1.(1) & 3.4.4.2.(2) of the Building Code. At issue is whether the proposed utilization of an open stair, descending from the second floor through a two storey high lobby to the ground floor level, as a required egress facility sufficiently complies with the Building Code.

4. **Provision of the Building Code**

Article 3.4.2.3.: Distance Between Exits

1. Except where a floor area is divided by a fire separation so that it is necessary to pass through it to travel from one exit to another exit, the least distance between 2 required exits from a floor area shall be
    a. one half the maximum diagonal dimension of the floor area, but need not be more than 9 m (29 ft 6 in) for a floor area having a public corridor, or
    b. one half the maximum diagonal dimension of the floor area, but not less than 9 m (29 ft 6 in) for all other floor areas.
2. The minimum distance between exits referred to in Sentence (1) shall be the shortest distance that smoke would have to travel between the required exits, assuming that the smoke will not penetrate an intervening fire separation.

Sentence 3.4.4.1.(1): Fire-Resistance Rating of Exit Separations

Except as provided in Article 3.4.4.3. and Sentences (2), 3.3.5.5.(3) and 3.4.4.2.(2), every exit shall be separated from each adjacent floor area by a fire separation having a fire-resistance rating not less than that required for the floor assembly above the floor area and, where there is

no floor assembly above, not less than that required by Subsection 3.2.2. for the floor assembly below, but in no case shall the fire resistance rating be less than 45 min.

Sentence 3.4.4.2.(2): Exits Through Lobbies

Not more than 1 exit from a floor area is permitted to lead through a lobby provided

c. the lobby floor is not more that 4.5 m (14 ft 9 in) above grade,
d. the path of travel through the lobby to the outdoors is not more than 15 m (49 ft. 3 in),
e. he adjacent rooms or premises having direct access to the lobby do not contain a Group C or F occupancy,
f. except as required in Clause (g), the lobby is not located within an interconnected floor space other than as described in Sentence 3.2.8.2.(6),
g. the lobby conforms to the requirements for exits, except that
    i. rooms other than service rooms and storage rooms may open onto the lobby,
    ii. the fire separation between the lobby and a room used for the sole purpose of control and supervision of the building need not have a fire-resistance rating, and
    iii. the fire separation between the lobby and adjacent occupancies that are permitted to open onto the lobby need not have a fire-resistance rating when the lobby and adjacent occupancies are sprinklered,
h. the fire separation required in Sentence 3.4.4.1.(1) shall be maintained between the exit and the lobby, and
i. hat if the exit serves a hotel, the lobby is not located within an interconnected floor space.

5. **Applicant's Position**

The applicant submitted that incorporating the subject unenclosed stairs as contributing to the required means of egress and exit capacity from the second floor, demonstrates sufficiency of compliance with the level of safety intended by the Building Code on the bases described below:

. Building Code 3.4.2.3. Distance Between Exits
    . Although Article 3.4.2.3. of the Building Code restricts the proximity of exits serving one floor based on their serving the entire floor area, the city draws an analogy between the upper lobby space and meeting room area on the one hand, and the floor area on the other hand in respect of this Code concept.

      Doors will be provided in the fire separation between the corridor and adjacent office space to provide access to enclosed stair No. 2 for meeting room occupants

and to enclosed stair No. 1 or unenclosed stair No. 3 for office occupants. Directional exit signage will be provided to clearly indicate that this path of travel constitutes access to an exit; signage will be provided within the office space to guide persons utilizing this route to enclosed stair No. 2. This will satisfy the application of Article 3.4.2.3. of the Building Code with respect to the meeting room area.

a. Building Code 3.4.4.1.(1). Fire Separation of Exits

. The requirement for fire separation of exit stairs from the adjacent storeys which they serve is based on concern that fire will spread into an exit and affect the ability of persons in storeys above or below to use that exit. The separation also preserves the floor-to-floor fire separation between storeys.

These concerns do not apply in respect of the two-storey-high lobby at 4342 Queen Street stair. Unenclosed stair No. 3 serves only the second floor and the second floor is already within the same fire compartment as the ground floor.

a. The total travel time required to leave a meeting room, traverse unenclosed stair No. 3 and then leave the building is considerably less than the maximum travel time the Code would permit for all occupants to gain access to an enclosed exit.

b. Building Code 3.4.4.2.(2). Egress Through Lobby

. The prohibition against more than one exit from a floor area leading through a lobby is intended to apply to storeys above or below the lobby where there is a chance that the lobby could become affected by the fire and persons seeking to leave the building from such other storeys could have to leave the protection of the enclosed exit stair to cross the lobby floor. This concept does not apply in this case, persons utilizing unenclosed stair No. 3 are not in ignorance of lobby conditions once they commence using stair No. 3. They are in the same fire compartment to begin with.

a. It is incidental that persons utilizing enclosed stair No. 2 to leave the second floor meeting room area enter into an enclosed exit stair shaft which then opens to the lobby below. Enclosed stair No. 1 is designed in respect of the lobby to conform to Sentence 3.4.4.2.(2) of the Building Code to satisfy the level of safety the Code demands for the basement and for the storeys above the second floor. Again, the second floor occupants who access enclosed stair No. 1 are already in the same fire compartment as the lobby before they enter the stair.

In establishing sufficiency of compliance for the design of the two storey lobby and egress from the Second Floor, the following general factors were also presented for consideration:

c. The building is fully sprinklered with an electrically-supervised sprinkler system, activation of which causes the fire alarm to sound and a signal to be sent to the fire department through an independent central station facility.
d. The fire alarm system will be automatically activated by sprinkler flow and by smoke detectors required in stair shafts and re-circulating air-handling systems.
e. The lobby is separated from the adjacent ground and second floor areas by an unrated fire separation which will be expected to restrict smoke spread from a fire originating elsewhere in the ground or second floors.
f. The lobby is essentially sterile space, as far as fire load is concerned. There is no occupancy designed for the corridor which would entail a fire load of any consequence. Wall and ceiling finishes conform to Code requirements for noncombustible construction.
g. The lobby has a clear height from the finished ground floor level to the ceiling of the second floor of some 7.7 m (25.25 ft), the resultant volume of the lobby will provide a large reservoir in which the smoke from an incipient fire not yet fully extinguished by the sprinkler system will be considerably diluted, unlike what may be expected in the narrower confines of a typical public corridor or even the interior of an exit stair shaft into which smoke may migrate during a fire.

6. **Chief Building Officials Position**

The respondent submitted that Sentence 3.4.4.1.(1) of the Building Code requires every exit to be separated from an adjacent floor area by a fire separation. The open stair descending from the second floor through a two storey high lobby to the ground floor level is not fire separated. Therefore, it must be considered a convenience stair and not a required exit.

Sentence 3.4.4.2.(2) of the Building Code states that only one required exit can lead through a lobby. If the open stair was considered to be a required exit, there would be two exits leading through the lobby.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that the egress system from the second floor of the building provides sufficiency of compliance with the technical requirements of the Building Code, subject to the following conditions:

. An egress door to office area # 228 will be introduced opposite to bridge # 215, at the fire separation of corridor # 213.

a. An exit sign will be installed above the aforementioned egress door, and an unobstructed path of travel 1100 mm wide will be maintained, with appropriate signage leading occupants to
stair # 2.

b. The use of the lobby for temporary exhibits which might increase the fire load will be addressed in the Fire Safety Plan.

8. **Reasons:**

. Stair # 3 is the most direct and familiar egress route from the second floor.

a. The performance level for exiting the second floor will be increased by using stair # 3 since the total evacuation time would be reduced when compared to the Building Code conforming situation for stair # 4.

Dated at Toronto, this 9th day, in the month of February, in the year 1995, for application number 199-05.

BCC Ruling No. 95-04-424

DATE OF RULING

January 26th, 1995

APPEARANCES

Mr. Steven M. Tomlin
Fire Protection Consultant
Morrison Hershfield Limited
North York, Ontario
For the Applicant

RULING

1. **The Applicant**

   The Corporation of the City of Ottawa is the holder of a permit under the Building Code Act, 1992 to construct an addition comprising a library, community rooms and gymnasium at St. Laurent Park, at 714-716 Morin Street, Ottawa, Ontario.

2. **Description of Constrution**

   The project includes two existing buildings; a swimming pool building and an arena building which have building areas of 1,195 m? and 2,260 m? respectively. Both buildings have a major occupancy of Group A Division 3 and have been in existence for more than five years. These buildings are not equipped with a sprinkler or standpipe system.

   The proposed construction would incorporate the two existing structures into a new facility which will include a library, community rooms and gymnasium. The addition will be separated from the existing buildings by a 1 hour fire separation. The area of the proposed addition is 3,874 m². Therefore, the new facility will have a total building area of 7,329 m².

   In lieu of providing a fire resistance rating for the roof an automatic sprinkler system is to be installed in the addition.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Subclause 3.2.9.1.(1)(b)(i) of the Building Code. At issue is whether or not a standpipe and hose system is required in the addition to the pool and arena buildings.

4. **Provision of the Building Code**

   Subclause 3.2.9.1.(1)(b)(i): Standpipe and Hose Systems

(1) Except as provided in Article 3.2.9.2., a standpipe and hose system hall be installed in every building that

(b) is greater in building area than the area shown in Table 3.2.9.A. for the applicable building height shown in the Table where the building

i. is not sprinklered, and
ii. is not more than 14 m (45 m 11 in) high measured between grade and the ceiling of the top storey, or

5. **Applicant's Position**

The applicant submitted that the literal intent of the Building Code had been achieved with regard to the requirements for a standpipe and hose system at the subject property.

Sentence 11.3.5.1.(1) of the Building Code indicates that renovations (i.e. extended buildings) which result in an increase in occupant load of more than 15% reduce the performance level of the existing building. Since the addition will increase the occupant load of the existing building by more than 15% the performance level of the existing building is reduced. Part 11 recognizes the hazard posed by the extension and proposes specific remedies to offset this hazard which does not include a stand pipe and hose system.

Article 11.3.3.22. of the Building Code provides a specific means for restoring the performance level of the existing buildings which includes evaluating and upgrading the ealy warning evacuation system for the whole building including:

- access to exit widths
- exit widths
- exit signs
- lighting of exits, lighting of access to exits and emergency lighting
- fire alarm systems
- travel distance and number of exits

These upgrades are intended to ensure that the performance level of the existing buildings is maintained and therefore compliance with the literal intent of Part 11 is achieved.

The applicant submitted that the new addition is required to comply with the other parts of the Building Code as indicated in Article 11.3.5.1. Part 3 of the Building Code requires that the roof

of the whole building have a fire resistance rating. However, based on Sentence 2.1.1.7.(1), this requirement only applies to the addition. In lieu of a fire resistance rating, an automatic sprinkler system will be installed in the addition as permitted by Article 3.2.2.12.

Under the provisions of Part 3 a standpipe and hose system is required in the whole building on the basis that the whole building is not sprinklered. However, based on Sentence 2.1.1.7.(1), Part 3 only applies to the addition. Therefore, since the addition is sprinklered a standpipe and hose system is not required in the addition as per Sentence 3.2.9.1.(1).

The applicant submitted that a fire originating in the addition will be controlled or extinguished by the sprinkler system in the addition. This coupled with the proposed 1 hour fire separation located between the old and new construction, and fire department accessibility leads us to believe that there would be no additional benefits by installing a standpipe and hose system in the addition.

6. **Chief Building Officials Position**

The respondent submitted that Subclause 3.2.9.1.(1)(b)(i) clearly sets out the basis for exemption for the installation of a standpipe and hose system; that is the entire building must be sprinklered.

The respondent does not dispute the application of Part 11 to the construction undertaken in the existing building and that Part 11 does not require the installation of a standpipe and hose system.

The respondent submitted that the addition must comply with Part 3 requirements. Therefore, either the new construction shall have both a sprinkler and standpipe system or the sprinkler system must be extended into the existing buildings. Alternatively, firewalls could be constructed in order to down size one building into several separate ones.

However, in this case, since the addition is fire separated from the existing building the partial sprinkler system could be considered as providing sufficiency of compliance with the technical requirements of the Building Code as determined by the Building Code Commission in accordance with s.24(1)(b) of the Building Code Act, 1993.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that not providing a standpipe and hose system in the addition comprising a library, community rooms and gymnasium conforms to the requirements of the Building Code.

8. **Reasons:**
   . Since the new building will be sprinklered a standpipe and hose system is not required by Part 3 of the Building Code.
   A. The existing building has been upgraded to comply with the early warning and evacuation requirements of Part 11 of the Building Code.
   B. The new building does not reduce the level of safety of the existing building.

Dated at Toronto, this 26th day, in the month of January, in the year 1995, for application number 1994-57.

For the Applicant

Mr. Eric Buchholz, Chief Building Official
Town of Penetanguishene
Respondent

RULING

1. **The Applicant**

   Mr. Guy Ealey is the holder of a permit under the Building Code Act, 1992 to construct an exterior masonry fireplace and chimney on the gable end of a single family residence (i.e. House) at 230 Church Street, Penetanguishene, Ontario.

2. **Description of Constrution**

   The masonry chimney had a basement solid fuel fireplace and ground floor gas fired fireplace.

   The chimney extended approximately 22 feet above the top of the foundation wall and protruded about 3.5 feet above the roof line. Its plan dimensions were 5 ft. 4 in. by 2 ft. The chimney consisted of 13 concrete block courses above the concrete foundation and continued above with one wythe of common brick.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Article 9.21.4.5. of the Building Code. At issue is whether the exterior masonry fireplace and chimney required bracing below the roof line to provide lateral stability.

4. **Provision of the Building Code**

   Article 9.21.4.5.: Lateral Stability

Chimneys shall be braced when necessary to provide lateral stability.

5. **Applicant's Position**

   The applicant stated that lateral supports or ties to the house structure were not necessary.

   The applicant submitted that the chimney started to lean away from the house due to a footing failure or because the footings were excavated and left exposed all winter.

6. **Chief Building Officials Position**

   The respondent stated that the chimney required lateral support.

   The respondent noted that the chimney separated from the exterior wall of the house by approximately 1 inch at the top.

   The respondent issued an "Order to Comply" under the Building Code Act requiring the provision of adequate lateral support for the chimney.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that the chimney's lateral bracing provided showed sufficiency of compliance with the Building Code.

8. **Reason:**

   Evidence submitted at the hearing indicated that the chimney was laterally restrained by soil, the basement fireplace hearth, the main floor gas fireplace hearth and by the roof overhang framing.

Dated at Toronto, this 11th day, in the month of January, in the year 1995, for application number 1994-55.

RULING

1. **The Applicant**

   Mr. Ron Barry, Works & Environment Department, City of Scarborough is the holder of a permit under the Building Code Act, 1992 to construct a public pool with light blue tiles at the Agincourt Recreation Centre, 31 Glenwatford Drive, Scarborough, Ontario.

2. **Description of Constrution**

   The Agincourt Recreation Centre Pool is a public pool with a large water slide. The deepest portion of the pool is 2050 mm in depth.

   The pool has been finished in a medium blue tile with dark blue decorative squares in a pattern for accent.

3. **Dispute**

The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Sentence 3.11.3.1.(19) of the Building Code. At issue is colour of the existing medium blue tiles in the submerged portion of the public pool.

4. **Provision of the Building Code**

Sentence 3.11.3.1. Pool and Pool Deck Design and
Construction Requirements

(19) Except for markings for safety or competition purposes, submerged surfaces in public pools shall be finished white or light in colour.

5. **Applicant's Position**

The applicant submitted that the blue tile does not effect the clarity of the pool bottom and therefore falls within the definition of "light colour" described in Sentence 3.11.3.1.(19) of the Building Code.

6. **Chief Building Officials Position**

The respondent submitted that Sentence 3.11.3.1.(19) of the Building Code states that "submerged surfaces in public pools shall be finished white or light in colour". However, the sides and bottom of the pool are finished in a mid-blue coloured tile.

Portions of the bottom and sides of the pool are difficult to see from certain locations along the perimeter of the pool. This poses a potential unsafe condition. Also, visibility of the bottom of the pool will be further reduced by the agitation water caused by users of the pool.

The respondent stated that the colour of the pool tiles darkened significantly when the pool was filled with water. Lighting levels must be increased so that the bottom of the pool is visible from anywhere on the pool deck.

7. **Commission Ruling:**

In favour of the Respondent. It is the decision of the Building Code Commission that the pool tile and pool lighting do not comply with the Building Code.

8. **Reason:**

   The existing colour of the pool tile and pool lighting do not provide sufficient visibility to adequately discern an object on the bottom of the pool from any point on the pool deck.

Dated at Toronto, this 11th day, in the month of January, in the year 1995, for application number 1994-56.

Mr. A. Jeffrey Chalmers
Chief Building Official
City of Peterborough
Respondent

RULING

1. **The Applicant**

   Mr. Vince Killen, St. Joseph's Hospital and Health Centre is an applicant for a permit under the Building Code Act, 1992 to construct a new canopy to be located over the fire access route at the outpatient entrance on the Rogers Street side of St. Joseph's Hospital and Health Centre, 384 Rogers Street, Peterborough, Ontario.

2. **Description of Constrution**

   The proposed entrance canopy is to be located over the fire access route at the outpatient entrance from Rogers Street. The canopy will have an overhead clearance of 4.27 metres (14' 0") and cover approximately one half the width of the fire access route.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Clause 3.2.5.7.(1)(c) of the Building Code. At issue is the determination of whether the 4.27 metre over head clearance of the proposed new canopy sufficiently complies with the Building Code.

4. **Provision of the Building Code**

   Clause 3.2.5.7.(1)(c): Access Route Design

1. A portion of roadway or yard provided as a required access route for fire department use shall

   (c) have an overhead clearance of not less than 5 m (16 ft 5 in).

5. **Applicant's Position**

The applicant stated that the purpose of the canopy is to provide shelter from the elements for patients entering or leaving the building. The applicant submitted that the canopy should be as low as possible to provide better protection from inclement weather. Also, the reduced canopy height avoided obstructing the second floor windows above the canopy.

The applicant stated that the City of Peterborough Fire Chief has accepted the 4.27 m clearance. Fire fighting equipment cannot exceed this height due to limitations of existing clearances provided at bridges, overhead wiring and traffic signals in the area.

6. **Chief Building Officials Position**

The respondent stated that the proposed canopy is over a required fire access route and accordingly must have an overhead clearance of not less than 5 m (16' 5"). The proposed canopy will have a vertical clearance of 4.27 m (14' 0").

The canopy is a new freestanding structure, therefore Subsections 11.2.3. and 11.2.4. of the Building Code do not apply.

The respondent submitted that there is no construction difficulty with raising the canopy other than blocking view from the upper windows.

The respondent does not have the authority to accept a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that providing a vertical clearance of 4.27 m (14' 0") for the proposed canopy over the fire access route shows sufficiency of compliance with the Building Code provided signage indicating the clear height is visible on approach to the canopy.

8. **Reasons:**
    A. The proposed canopy does not affect fire fighting capability. Two means of access are available on the fire access route with the canopy at the terminus.
    B. The local fire department has accepted the 4.27 m (14' 0") clear height. Evidence was presented that current and future fire fighting vehicles would clear the proposed canopy height.

Dated at Toronto, this 26th day, in the month of January, in the year 1995, for application number 1994-58.

APPEARANCES

Mr. Fred Schiedel, President
Schiedel Construction Inc.
For the Applicant

RULING

1. **The Applicant**

   Santasalo North America Inc. is the holder of a permit under the Building Code Act, 1992 to construct a cold steel fabricating and steel material storage addition at 1615 Bishop Street North, Cambridge, Ontario.

2. **Description of Constrution**

   A building permit was issued on September 15, 1994 to construct a cold steel fabricating and steel material storage addition. When the permit was issued a stand pipe and hose system was required as part of the plans review.

   The building area of the new addition is 470 m². The existing building area is 2943 m², with a combined area of 3,413 m².

   The building was classified as a Low Hazard Industrial Occupancy (F-3). It was designed in accordance with Article 3.2.2.59. of the Building Code.

   The building is of non-combustible construction, 1 storey in building height, unsprinklered and faces 1 street.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Clause 3.2.9.1.(1)(b) of the Building Code. At issue is the requirement to provide a standpipe and hose system in the proposed addition. Table 3.2.9.A. which forms part of Sentence 3.2.9.1.(1) of the Building Code requires a standpipe and hose system for one storey F-3 occupancies over 3000 m².

4. **Provision of the Building Code**

Clause 3.2.9.1.(1)(b) Standpipe and Hose Systems

1. Except as provided in Article 3.2.9.2., a standpipe and hose system shall be installed in every building that

   (b) is greater in building area than the area shown in Table 3.2.9.A. for the applicable building height shown in the Table where the building

   i. is not sprinklered, and
   ii. is not more than 14 m (45 m 11 in) high measured between grade and the ceiling of the top storey.

5. **Applicant's Position**

The applicant stated that the level of safety required by the Building Code is met without the provision of a standpipe and hose system for the following reasons:

1. The building is used for cold steel processing and steel material storage with little combustible loads;
2. Construction is non-combustible;
3. A.B.C. fire extinguishers are located throughout the building;
4. The Cambridge Fire Department is located on the adjacent property and the water testing/training gun can cover a portion of the existing building; and,
5. There is good driveway access all around the building with a fire hydrant in front of the building.

6. **Chief Building Officials Position**

The respondent stated that the existing building area plus the new addition building area is 3413 m². Clause 3.2.9.1.(1)(b) of the Building Code requires a stand pipe and hose system for the addition because the maximum building area is greater than 3000 m².

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that not providing standpipe and hose system in the new addition shows sufficiency of compliance with the Building Code.

8. **Reasons:**

1. The existing building and new addition are used for cold steel processing and the combustible loading is minuscule.
2. The building is located next door to a constantly attended fire hall.

Dated at Toronto, this 2nd day, in the month of December, in the year 1994, for application number 1994-53.

For the Respondent

REPORT

1. **Order of Ontario Court (General Division)**

   Brian James Dyce (the "Applicant") applied to the Ontario Court (General Division) under s.25(1) of the Building Code Act, 1992 requesting certain relief, including an order setting aside three orders of the Town of Wasaga Beach (the "Respondent") issued under the Building Code Act, 1992 against 80 Smallman Drive, Wasaga Beach. In that application, the Honourable Madam Justice Eberhard of the Ontario Court (General Division), on consent of the parties, on November 24, 1994 made the following order:

   i. This court orders that the question respecting the interpretation of the technical requirements of the Building Code or the sufficiency of compliance with the technical requirements of the Building Code as raised in this application, namely whether sheathing paper is required on the garage walls beneath the masonry veneer on the dwelling being erected at 80 Smallman Drive, in the Town of Wasaga Beach, be referred to the Building Code Commission for a hearing pursuant to subsection 25(5) of the Building Code Act, 1992.
   ii. This court orders that the Building Code Commission, following the hearing, shall report back to the parties and this Court.
   iii. This Court orders that this application be adjourned sine die, returnable on 7 days notice by either party.

2. **Background**

Mr. Brian James Dyce and Mr. James E. Dyce are the holders of a building permit to construct a single family dwelling (i.e. house) with an attached garage under the Building Code Act, 1992 at 80 Smallman Drive, Wasaga Beach, Ontario.

3. **Description of Construction**

The building under construction is a single family dwelling (i.e. house) with an attached garage. The building is frame construction consisting of wood studs which are sheathed on the outside face with waferboard. The exterior finished cladding consists of masonry veneer. The wall studs of the unheated attached garage are exposed to the inside garage space.

4. **Issue on Reference**

The reference from the Ontario Court (General Division) directed that the Building Code Commission interpret the technical requirements of the Building Code or the sufficiency of compliance with the technical requirements of the Building Code that were raised in the application before the Ontario Court (General Division) pursuant to which the reference was ordered, and in particular to determine whether sheathing paper is required on the garage walls beneath the masonry veneer on the dwelling erected at 80 Smallman Drive in the Town of Wasaga Beach.

5. **Provision of the Building Code**

`Article 9.23.17.3.  Sheathing Paper`

1. Except as provided in Sentences (3) and (6), not less than 1 layer of sheathing paper shall be applied beneath siding, stucco or masonry veneer.
2. Sheathing paper required in Sentence (1) shall be applied so that joints are lapped at least 100 mm (4 in), and if applied horizontally, the upper sheets shall overlap the lower sheets.
3. Sheathing paper required in Sentence (1) shall be applied so that joints are lapped at least 100 mm (4 in), and if applied horizontally, the upper sheets shall overlap the lower sheets.
4. Except as provided in Sentence (6), where no sheathing is used with masonry veneer or other siding, not less than 2 layers of sheathing paper shall be applied beneath the veneer or siding.

5. All joints in the sheathing paper required in Sentence (3) shall occur over framing, and the paper shall be fastened to the framing with roofing nails or staples spaced not more than 150 mm (5? in) along the edges of the outer layer of sheathing paper.
6. Wall sheathing may be used in lieu of 1 layer of sheathing paper required in Sentence (3), and the thickness need not conform to Table 9.23.16.A.
7. Sheathing paper may be omitted beneath siding when the joints in the siding are formed to effectively prevent the passage of wind and rain in conformance with Sentence (7) or (9) as applicable.
8. Siding consisting of sheets of plywood, hardboard, waferboard or asbestos cement is considered to meet the requirements Sentence (6) provided the siding is applied so that all edges are directly supported by framing and the vertical joints between adjacent sheets covered with battens or shiplapped or otherwise matched to provide weather tight joints.
9. Vertical joints between sheets described in Sentence (7) shall be caulked.
10. Metal siding consisting of sheets of metal is considered to meet the requirements of Sentence (7) where the joints between sheets are of the locked seam type.

6. **Applicant's Position**

The Applicant submitted that the purpose of the sheathing paper is to prevent drafts and the entry of wind driven rain into the wall cavity. Building Code development history shows that the sheathing paper requirement in the Building Code was a response to the practice of using board lumber sheathing with horizontal joints every 6 to 8 inches. This type of construction was particularly vulnerable to the passage of wind and rain.

The Applicant said that with the advent of panel type sheathing the situation is quite different. Sheathing paper is not required at all if particle board or plywood sheets are used as siding and installed with all edges supported and joints between adjoining panels caulked.

Concerning the 21" wide wall located to the left of the garage door opening, the caulking requirement would be irrelevant since there are no adjoining panels. Sheathing paper would not make any difference since the waferboard covers this area in one continuous sheet.

As the wall separating the alcove and the garage is comprised of more than one sheet of waferboard and is not protected by sheathing paper, it does not present a problem concerning the intent of the Building Code. Both sides of the wall are unconditioned spaces. The possibility of drafts from the alcove to the unheated garage should not be a concern nor is there a likelihood of

rain entry from either side since both have a roof enclosure. The Applicant questioned what purpose sheathing paper serves in this location.

7. **Respondent's Position**

The Respondent stated that the dispute centres around whether sheathing paper is required on garage walls, beneath the masonry veneer on this structure. The provisions of the Building Code, and in particular Article 9.23.17.3. specifically requires sheathing paper.

The Respondent stated that by not providing the sheathing paper any wind driven rain on the waferboard will not be redirected over the flashing to the weep holes. Further accumulation of moisture at the base of the wall could adversely affect the structural integrity of the wall system.

The Applicant was advised of this before he proceeded with the bricking of exterior walls in the garage, he has refused to comply with the request of the Building Department.

8. **Findings and Conclusions**

It is the decision of the Building Code Commission that not installing sheathing paper beneath the brick veneer on the garage attached to a house at 80 Smallman Drive does not comply with the Building Code.

9. **Reasons:**

The intent of the sheathing paper beneath brick veneer as part of wood frame wall assemblies is to:

0. provide protection of the wall assembly from weather, primarily wind and wind-driven rain, and
1. provide means for directing water that penetrates the brick veneer rain screen over the flashing which is required at the base of the wall to direct water to the outside.

Two layers of sheathing paper are deemed to fulfil these requirements.

The Building Code requires two layers of sheathing paper beneath brick veneer. One layer of sheathing can substitute for one layer of sheathing paper (as illustrated). Given the requirement that sheathing paper directs wind-driven rain over installed flashing, sheathing paper is normally installed over the sheathing.

In some instances, where no rain screen is part of the wall system, that is, where the exterior wall finish functions as a weather barrier, sheathing paper is not required. Acceptable exterior finishes in this case include siding where joints in the siding are formed to effectively prevent the passage of wind and rain. This may include sheets of plywood, hardboard, waferboard, or asbestos board provided the siding is applied so that all edges are directly supported by framing and the vertical joints are caulked and covered with battens or they are ship lapped or matched to provide weather tight joints. Metal siding with locked seam joints can also be used without sheathing paper.

Brick veneer is not considered a weather tight exterior finish. Therefore, the wall must be protected from weather with two layers of sheathing paper or a layer of sheathing paper and a layer of sheathing.

The Applicant made two proposals which are examined below:

2. The proposal to caulk and /or seal the joints in the sheathing in lieu of installing a layer of sheathing paper may provide protection from weather. However, the bottom of wall flashing as installed fails to meet the intent of the Code with respect to water transmission to weep holes installed in the brick veneer. Further, flashing must be installed as per article 9.20.13.7. beneath brick veneer. This is not acceptable.
3. Installing sheathing paper on the inside of the face of the wall sheathing may provide additional protection from the weather. However, adequate water transmission to the flashing is not assured in this circumstance. This is not acceptable.

Dated at Toronto, this 9th day, in the month of December, in the year 1994, for application number 1994-42.

Barrister and Solicitor

Jon Winton
Leber/Rubes Inc.
For the Applicant

RULING

1. **The Applicant**

   The TDL Group Ltd. is the holder of a permit under the Building Code Act, 1992 to construct a Tim Hortons drive-thru restaurant that includes direct entry into the building to purchase goods at 851 Pitt Street, Cornwall, Ontario.

2. **Description of Constrution**

   The subject building is classified as a Group E Major Occupancy in accordance with Article 3.1.2.5. of the Building Code.

   The building supports a drive-thru type operation and also contains facilities to permit direct entry into the building to purchase goods.

   The building will not be provided with a barrier-free washroom designed to meet the barrier-free requirements.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the interpretation of the technical requirements of Section 3.7. and particularly Article 3.7.2.3. of the Building Code. At issue is the determination of whether a barrier-free washroom is required.

4. **Provision of the Building Code**

   `Article 3.7.2.3.  Washrooms Required to be Barrier-Free`

1. Except where other barrier-free washrooms are provided on the same floor level within 45 m (147 ft 8 in) and except within suites of residential occupancy and buildings exempted in Clauses 3.7.1.1.(1)(a), (b) and (c), in buildings where a washroom is required in accordance with Subsection 3.6.4., a barrier-free path of travel shall be provided to a barrier- free washroom designed to accommodate disabled persons in conformance with the appropriate requirements in Articles 3.7.3.8. to 3.7.3.11.
2. Except as permitted in Sentence (3), where washrooms in excess of those required by Subsection 3.6.4. are provided in a storey to which a barrier-free path of travel is required in conformance with Article 3.7.2.1., these washrooms shall be designed to accommodate disabled persons in conformance with the appropriate requirements in Articles 3.7.3.8. to 3.7.3.11.
3. Washrooms need not conform to the requirements in Sentence (2) provided
    a. they are located within suites of residential occupancy,
    b. other barrier-free washrooms are provided on the same floor level within 45 m (147 ft 8 in), or
    c. they are located in an individual suite having an area of less than 300 m?(3230ft?) in buildings where such suite is completely cut off from the remainder of the building so that there is no access to the remainder of the building.

5. **Applicant's Position**

This drive-thru facility is a satellite to the main facility across the street in a shopping mall. It is intended that the main facility will have public washrooms and seating. The drive-thru facility is intended primarily to serve people in vehicles.

The applicant admitted that the Building Code did not exempt them from the barrier-free access washroom requirements.

The applicant stated that physically challenged people do not have to leave their vehicles in order to purchase goods and the washroom is for employees only. Therefore, the provisions of a barrier-free access and a barrier-free washroom are not needed.

Also, health and safety standards can not be enhanced to a level that would safely permit a physically challenged individual from working in this drive-thru take out facility.

6. **Chief Building Officials Position**

The respondent did not object to the applicants position; however, he expressed a concern about the over 300 ft. distance between the main restaurant and the drive-in facility.

The respondent does not have the authority to accept a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 of the Building Code is not applicable.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that not providing a barrier-free washroom shows sufficiency of compliance with the Building Code.

8. **Condition**

   The public pedestrian access into this facility must be removed.

9. **Reasons:**
   1. The nature of the operations cannot safely accommodate physically challenged individuals.
   2. Members of the public will not be allowed access inside the building.

Dated at Toronto, this 2nd day, in the month of December, in the year 1994, for application number 1994-54.

For the Respondent

RULING

1. **The Applicant**

   The President of the Lethbridge Stake, The Church of Jesus Christ of Latter-day Saints is the holder of a permit under the Building Code Act, 1992 to construct a one storey church at 345-351 Highway No. 8, Stoney Creek, Ontario.

2. **Description of Constrution**

   The building is designated as an assembly occupancy, Division 2 (A-2) single storey structure, facing three streets. Construction is combustible wood frame with brick face. The building area is 1083 m² (11,657 sq. ft.). The attic service area is 183.9 m² (1980 sq. ft.) and contains 10 residential type gas fired furnaces.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the interpretation of the technical requirements of Articles 3.3.1.13., 3.4.2.5. & 3.4.4.1. of the Building Code. At issue is the determination of whether the means of egress provided for the attic service room complies with the Building Code.

4. **Provision of the Building Code**

   Article 3.3.1.13. Ramps, Stairways and Passages

1. Except as provided in Sentence (2), Articles 3.3.4.8. and 3.3.1.14., ramps, stairways and passageways used by the public as access to exit shall conform with the requirements in Subsection 3.4.6.
2. Ramps and stairways that do not conform to the requirements of Sentence (1) are permitted to service rooms and service spaces and are permitted in industrial occupancies, provided the ramps and stairways are intended only for occasional use for servicing equipment and machinery.

Article 3.4.2.5. Location of Exits

3. Except as provided in Sentences (2), (3) and 3.3.2.4.(6), where more than one exit is required from a floor area, such exits shall be located so that the travel distance to not less than one exit as described in Article 3.4.2.4. shall be not more than
    a. 25 m (82 ft) in any Group F, Division 1 occupancy,
    b. 45 m (147 ft 8 in) in any sprinklered floor area that contains an occupancy other than Group F, Division 1,
    c. 40 m (131 ft 3 in) in any Group D occupancy
    d. 105 m (344 ft 6 in) in any floor area, served by a public corridor, in which rooms and suites are not separated from the remainder of the floor area by a fire separation, provided
        i. the public corridor has a width of not less than 9 m (29 ft 6 in),
        ii. the ceiling height in the public corridor is not less than 4 m (13 ft 1 in) above all floor surfaces,
        iii. the building is sprinklered, and
        iv. not more than one half of the required egress doorways from a room or suite open into the public corridor when the room or suite is required to have more than one egress doorway.
    e. 60 m (196 ft 10 in) in any storage garage that conforms to the requirements of Article 3.2.2.60., and
    f. 30 m (98 ft 5 in) in any other occupancy.
4. Except for a Group F, Division 1 occupancy, Sentence (1) need not apply if exits are placed along the perimeter of the floor area and are not more than 60 m (196 ft 10 in) apart, measured along the perimeter, provided each main aisle in the floor area leads directly to an exit.
5. Where more than one exit is required, every exit shall be considered as contributing not more than one half the required exit width.
6. Exits shall be located and arranged so that they are clearly visible or their locations are clearly indicated and they are accessible at all times.

Article 3.4.4.1. Fire-Resistance Rating of Exit Separations

7. Except as provided in Article 3.4.4.3. and Sentences (2), 3.3.5.5.(3) and 3.4.4.2.(2), every exit shall be separated from each adjacent floor area by a fire separation having a fire-resistance rating not less than that required for the floor assembly above the floor area and, where there is no floor assembly above, not less than that required by Subsection 3.2.2. for the floor assembly below, but in no case shall the fire-resistance rating be less than 45 min.
8. The fire-resistance rating of the fire separation in Sentence (1) need not be more than 2 h.
9. Where an exit stair in an assembly hall or theatre serves more than one balcony level, the exit stair shall be separated from the remainder of the building in conformance with Sentence (1).

5. **Applicant's Position**

The Applicant stated that, (a) the space is not a 'Floor Area', it is a roof top enslosure as per Sentence 3.2.1.1.(1), and (b) the space is a Service Room and therefore, has no occupancy. Further, Sentence 3.1.1.13.(2) states that the stairways do not have to comply with Subsection 3.4.6. regarding access to exits. The Applicant said that spiral stair and ladders are positioned so the maximum travel distance is 120 ft. to the exit doors.

6. **Chief Building Officials Position**

The Respondent's reasons for non-acceptance is "The proposed Attic Plan is a defined Floor Area requiring adequate exit facilities to be provided in order to comply with the Building Code requirement pertaining to exiting and fire protection for the occupants."

The respondent stated that Sentence 3.3.1.13.(2) provides substantial relief from the requirements of Subsection 3.4.6. only. The requirements for fire separations for exits (OBC 3.4.4.1.) and maximum travel distance (OBC 3.4.2.5.) are not addressed and are still required.

The Building Code only permits ladders in a below ground service room situation as noted in Sentence 3.3.1.3.(10), and also prohibits spiral stairs in exits as noted in Article 3.3.1.15.

The respondent submitted that exit facilities from the floor area must still comply with the requirements for exits found in Article 3.4.1.1. of the Building Code.

It is for these reasons that the Respondent does not support the applicant's position.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that the use of a spiral stair and fixed ladders to provide means of egress from the service rooms shows sufficiency of compliance with the Building Code provided that additional fixed ladders are installed so that the maximum travel distance from any part of the service rooms to an exit does not exceed 30 m.

8. **Reason:**
    a. The building is being considered an one storey building, with a service area containing the building's heating equipment above.
    b. Since the service area will not be accessible to the public, the spiral stair and the fixed ladders are considered adequate for egress purposes.
    c. The maximum travel distance from any point of the service area to the exit doors on the main level will not exceed 30 m. This would not cause a significant increase in the time required to exit the building.
    d. The service area is separated from the main floor by a 1 hr fire separation.
    e. The service area will be provided with heat detectors connected to a supervised fire alarm system.
    f. Emergency lighting will be provided in the service area.

Dated at Toronto, this 15th day, in the month of December, in the year 1994, for application number 1994-51.

Mr. Sang Shim

PLACE

Toronto, Ontario

DATE OF RULING

December 15, 1994

RULING

1. **The Applicant**

   Ms. Martha Krenek, Landlord is the holder of a permit under the Building Code Act, 1992 to convert a single family dwelling (i.e semi-detached house) into two dwelling units, one above the other, at 1368 Davenport Road, Toronto, Ontario.

2. **Description of Constrution**

   The applicant proposes to convert a single family dwelling (i.e. house) into two dwelling units, one above the other. The building is more than 5 years old.

   The plans indicate only one means of egress out of the basement apartment. This is provided by an exterior door at the basement level served by an stairway leading to the finished ground level.

   Directly above the exterior basement exit is a window opening in the exterior wall of the unit above. The vertical distance between the window above and the exit below is less than 5 m.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Article 9.9.4.4. of the Building Code. At issue is whether the window above the unenclosed exit stair requires protection with wired glass in fixed steel frames or glass block conforming to Articles 9.10.13.5. and 9.10.13.7.

4. **Provision of the Building Code**

   Article 9.9.4.4. Openings Near Unenclosed Exit Stairs and Ramps

   Where an unenclosed exterior exit stair or ramp provides the only means of egress from a suite, and is exposed to fire from openings in the exterior walls of another fire compartment, the openings in the exterior walls of the building shall be protected with wired glass in fixed steel frames or glass block conforming to Articles 9.10.13.5. and 9.10.13.7. when the openings in the exterior walls of the building are within 3 m (9 ft 10 in) horizontally and less than 10 m (32 ft 10 in) below or less than 5 m (16 ft 5 in) above the exit stair or ramp.

5. **Applicant's Position**

The applicant submitted that the level of safety intended by the Building Code is being maintained due to an additional escape window provided from a bedroom at the rear of the basement apartment.

The window has an area of 12 square feet with an individual unobstructed opening of 6 square feet and no dimension less than 2 feet. The window sill is 4 feet above the floor and 3 feet 6 inches below the adjacent ground level.

The applicant proposes to provide fixed steps to reach the window in the window well to facilitate egress from the dwelling unit.

6. **Chief Building Officials Position**

The respondent submitted that in accordance with Article 9.9.4.4. of the Building Code the subject window must be protected with wired glass in fixed steel frames or glass block. This is due to the basement apartment not having another adequate means of egress and the window being very close to the unenclosed exit stair.

The respondent also submitted that the proposal to use the rear bedroom window as a separate means of egress does not comply with Article 9.9.2.4. of the Building Code.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that the living room window on the first floor conforms to the Building Code, provided that the bedroom window in the basement meets the following criteria:

a. The sill height is not more than 1 m (3'-3") above or below adjacent ground level;
b. the window can be opened from the inside without the use of tools;
c. the window has an individual unobstructed open portion having a minimum area of 0.38 m sq. (4.1 sq. ft.) with no dimension less than 460 mm (18");
d. the sill height does not exceed 900 mm (2'11") above the floor or fixed steps;
e. where the window opens into a window well, a clearance of not less than 1 m (3'-3") shall be provided in front of the window; and,
f. smoke alarms are installed in every dwelling unit and in common areas in conformance with Subsection 9.10.18. and are interconnected.

8. **Reason:**

Since the proposed bedroom escape window will conform to Compliance Alternative C121.1 in Part 11 of the Building Code, the bedroom window can be considered as a second means of egress and thereby eliminate the need for glass or wired glass block on the first floor living room window.

Dated at Toronto, this 15th day, in the month of December, in the year 1994, for application number 1994-43.

RULING

1. **The Applicant**

   Thomasfield Homes Ltd. is the holder of a permit under the Building Code Act, 1992 to construct a multi residential condominium townhouse building at Westhill Condominiums, Baker Street, Waterloo, Ontario.

2. **Description of Constrution**

   The Westhill Condominiums is a multi residential townhouse project with a building area of 641 m?. Each dwelling unit is served by it's own storage garage. There is no dwelling unit above another dwelling unit.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with the technical requirements of Article 3.3.5.7. of the Building Code. At issue is the determination of whether the construction between the garages and the dwelling units may conform to Sentence 9.10.9.16.(3) of the Building Code instead of the required 1.5 hour fire separation.

4. **Provision of the Building Code**

   Article 3.3.5.7.: Storage Garage Separation

A storage garage shall be separated from other occupancies by a fire separation with a fire-resistance rating of not less than 1.5 h.

5. **Applicant's Position**

   The applicant stated that the Building Area is 641 m?. Each garage serves only one dwelling. Overall conditions are similar to the provisions on Part 9 (i.e. Article 9.10.9.16. and 9.10.13.15.).

6. **Chief Building Officials Position**

   The respondent stated that if the construction between the garages and the dwelling units were in accordance with Sentence 9.10.9.16.(3) the intent of the Code for this multi tenant residential building would be met.

   The respondent does not have the authority to permit a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that using Sentence 9.10.9.16.(3) for the construction between the individual garages and the individual dwelling units shows sufficiency of compliance with the Building Code.

8. **Reasons:**
   a. Sentence 9.10.9.16.(3) better addresses the proposed building design. Each garage only serves one unit rather than a multi-car garage as envisioned in Part 3 building.
   b. The building is slightly larger than the Part 9 area limits.

Dated at Toronto, this 22nd day, in the month of November, in the year 1994, for application number 1994-45.

PLACE

Toronto, Ontario

DATE OF RULING

November 22, 1994

APPEARANCES

Mr. Brian Haley
Assistant City Solicitor
City of York
For the Respondent

RULING

1. **The Applicant**

   Mr. Pietro Alaimo is the holder of a permit under the Building Code Act, 1992 to construct a two storey single family dwelling (i.e. house) at 46 Snider Avenue, City of York, Ontario.

2. **Description of Constrution**

   The applicant proposed to construct a two storey house within 3 m of a chimney on the adjacent property.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the interpretation of the technical requirements of Article 9.21.4.4. of the Building Code. At issue is the determination of whether the building may be constructed within 3m of an existing chimney on the adjacent property.

4. **Provision of the Building Code**

   Article 9.21.4.4.: Height of Chimney Flues.

   A chimney flue shall extend not less than 900 mm (2 ft 11 in) above the highest point at which the chimney comes in contact with the roof, and not less than 600 mm (23? in) above the highest roof surface or structure within 3m (9 ft 10 in) of the chimney.

5. **Applicant's Position**

   The applicant stated that prior to May of 1992, he owned a two storey brick and frame residential dwelling on the subject property.

   On May 4, 1992 he was granted a demolition permit and was assured the corresponding building permit would be issued forthwith. After effecting the demolition of the existing dwelling house,

Mr. Alaimo proceeded to construct the footings for the proposed house. He was advised on June 3, 1992, that the building department had taken theposition that two existing chimneys on an adjacent property caused the proposed house to be in contravention of the Building Code.

The building department then suggested that the problem could be solved if Mr. Alaimo agreed to extend the chimney belonging to the adjacent property owner to a height which would cause it to be at least 3 m away from the roof of the proposed house. Unfortunately, Mr. Alaimo was not able to secure the consent of the neighbour to extend the chimneys.

6. **Chief Building Officials Position**

The respondent stated that an application for a building permit was made in May, 1992 for a two storey house. The respondent refused to issue the permit unless the plans were changed to provide adequate clearance to the existing chimney on the neighbouring property. An alternative was to extend the chimneys or convert the existing furnace on the neighbouring house to a high efficiency furnace. However, this would only address one chimney since the other is a fireplace chimney.

The owner cancelled his application for a permit in April 1993. A new application was made on June 30, 1994 and a permit was issued August 5, 1994. The plans showed that part of the second floor was recessed at two locations to provide the 3 m clearance required by the building department.

The respondent argued that Article 9.21.4.4. applies not only to the new construction but to the existing two chimneys on an adjacent property. In other words, the applicant's dwelling must be designed to ensure that the proper clearances as per Article 9.21.4.4. between the existing chimneys and the applicant's dwelling are maintained.

The respondent also felt he had a common Law duty of care which extends to neighbouring properties.

The respondent said that he considers Common Law to be applicable Law under Subsection 8(2) of the Building Code Act, 1992.

The respondent stated that the owner was issued a stop work order as he proceeded to construct the second story without the recesses as shown on the permit plans.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that the two storey dwelling under construction at 46 Snider Ave., City of York, complies with Article 9.21.4.4. of the Building Code.

8. **Reasons:**
    a. Article 9.21.4.4. applies only to the proposed construction on the applicant's property and is not applicable to existing chimneys on adjacent properties.
    b. The Code does not address any adverse effect to adjacent properties in this matter of chimney flues such as the Code does in the matters of surface drainage and groundwater levels.
    c. Should there be cause for concern after construction of the new building with regards to life safety and the protection of property of the adjacent buildings, other legislation is available.

Dated at Toronto, this 22nd day, in the month of November, in the year 1994, for application number 1994-48.

MDS Laboratories
Etobicoke, Ontario

For the Applicant

RULING

1. **The Applicant**

   MDS Health Group Ltd. is the applicant for a permit under the Building Code Act, 1992 to construct a medical clinic in the central portion of a new single storey noncombustible commercial structure, being Unit 2, 1224 Place D'Orleans Drive, Gloucester, Ontario.

2. **Description of Constrution**

   The applicant proposed to construct a clinic comprising five medical practices and a common waiting area. The clinic would occupy the central portion (i.e. 585 m?) of a new single storey noncombustible commercial structure.

   MDS Health Group Ltd. have sublet the clinic space to five groups of doctors or individual doctors. The clinic is designed as a grouping of five medical practices around a common waiting area. The reception areas of each of the five component practices are open directly to the common waiting area.

   The individual medical practices share cleaning expenses and are jointly responsible for furnishing and maintaining the common area as well as jointly leasing the security system for the unit.

   The buildings size and Group D occupancy imposes no requirement for a fire alarm system.

3. **Dispute**

The dispute between the Applicant and Respondent concerning sufficiency of compliance with the technical requirements of Sentence 3.3.1.4.(1) and the definitions of Suite and Public Corridor in Article 1.1.3.2. of the Building Code. At issue is the determination of whether the walls of the common waiting area serving five medical practices are required to be constructed as a 45 minute fire separation.

4. **Provision of the Building Code**

Sentence 3.3.1.4.(1): Public Corridor Separations

1. Except as otherwise required in this Part, public corridors shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 1 h except that
    a. the fire resistance rating need not be more than 45 min when the fire-resistance rating of the floor assembly is not required to be more than 45 min,
    b. no fire-resistance rating is required when the floor area is sprinklered and the corridor does not serve an institutional occupancy or a residential occupancy,
    c. no fire separation is required in a sprinklered floor area where,
        i. the corridor is more than 5 m (16 ft 5 in) in unobstructed width, and
        ii. the corridor does not serve an institutional occupancy or a residential occupancy,
    d. a floor assembly above a crawl space that is not considered a basement in Sentence 3.2.2.5.(2) is not required to be a fire separation, and
    e. no fire separation is required in a sprinklered floor area where an occupancy in the corridor conforms to the requirements of Sentence 3.3.1.9.(6).

Article 1.1.3.2.: Definitions

Suite: means a single room or series of rooms of complementary use, operated under a single tenancy, and includes dwelling units, individual guest rooms in motels, hotels, boarding houses, rooming houses and dormitories as well as individual or complementary rooms for business and personal services occupancies.

Public Corridor: means a corridor that provides access to exit from more than 1 suite.

5. **Applicant's Position**

The applicant stated that the design of Unit 2, 1224 Place D'Orleans Drive in Gloucester, Ontario, incorporating walls between the Common Area and the remainder of Unit 2 which are not fire separations demonstrates sufficiency of compliance with the level of safety intended by the Building Code on the following bases:

1. Due to the joint use of the Common Area by the five component medical practices, and the ability to apprehend an incipient fire or smoke hazard due to visually open reception facilities and glazed doors, occupants will have an enhanced ability to apprehend a fire than would be the case with an opaque, rated fire separation.
2. Travel distance from any point in the unit is within 23 m of an exit door. This compares favourably with the allowance in Clause 3.3.2.5.(1)(c) of the Building Code whereby corridors used by the public in assembly occupancies need not be fire separated where travel distance measured from any point in the floor area does not exceed the travel distance limit imposed for the occupancy.
3. A single zone, single stage fire alarm system utilizing automatic smoke detectors will be installed. The fire alarm system will incorporated the following features:
    i. single smoke detectors in each of the five medical suites except that Suite 600, due to its larger size and elongated plan, would have two smoke detectors. These smoke detectors will be installed in the circulation areas of each suite so that smoke arising from the more remote portions of the suite will be expected to be intercepted prior to its impingement on the egress doors from the suite into the Common Area. Smoke detectors will also be installed in accordance with the spacing criterion in ULC S524, "Standard for the Installation of Fire Alarm Systems", in the Common Area,
    ii. a pull station at each exterior exit door,
    iii. a control panel incorporating electrical supervision capability and an emergency power supply,
    iv. audible signal appliances installed so that alarm signals may be heard throughout Unit 2, and
    v. associated wiring.

This fire alarm system with automatic smoke detection will provide the very significant benefit of early detection and warning of a potential fire arising in a suite, remotely from potential occupants of the Common Area or other suites. It is expected that this would constitute a superior situation in terms of life safety than would be provided for Unit 2 with the provision of a

45 min rated partition between the Common Area and the remainder of the unit and no alarm system with automatic early warning smoke detection devices.

The Applicant respectfully requested the Building Code Commission consider the merits of this submission and rule on its acceptance.

6. **Chief Building Officials Position**

The respondent stated that the space is being divided into several suites each of which is being individually sublet. These suites are being served by a public corridor containing waiting areas.

Section 3.3.1.4.(1) specifies that a public corridor shall be separated from the remainder of the floor area by a fire separation. The submitted plans do not indicate the required fire separation.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that not constructing walls in the common area as a fire separation shows sufficiency of compliance with the Building Code for the following reasons:

1. The common functions of the medical clinic including the burglar alarm system and the waiting area shared by the laboratory and medical practices.
2. The fire alarm system will provide prompt detection and notification to the occupant of a fire condition.
3. The maximum travel distance is 23 m.

Dated at Toronto, this 10th day, in the month of November, in the year 199*, for application number 1994-50.

For the Respondent

RULING

1. **The Applicant**

   Page & Steele Architects is the applicant for a permit under the Building Code Act, 1992 to convert floors 1 to 4 of an existing fifteen storey reinforced concrete building from office to residential apartment use at 50 Holly Street, Toronto.

2. **Description of Constrution**

   The building in question (i.e. 50/60 Holly Street) is an existing fifteen storey, reinforced concrete building. It originally contained four storeys of Group D occupancy on Floors 1 to 4, a fifth floor mechanical level and residential rental apartments on Floors 6 to 15.

   50/60 Holly Street is a single building. "50 Holly Street" is the address of Floors 1 to 4, "60 Holly Street" is the address of Floors 6 to 15. There is a separate main entrance and lobby for each address.

   Floors 1 to 4 are being converted from office to residential apartment use.

   The existing building configuration is such that Floor 1 to 4 are served by one set of elevators, access to which is gained from the street at the 50 Holly Street lobby. The upper residential portion of the building and the fifth floor mechanical level are serviced by a complete separate set of elevators in a separate shaft, access to which is provided from the street through 60 Holly Street lobby. There is no common floor above Floor 1 that is accessible from both these banks of

elevators. On this basis, it is not possible to transfer out of one elevator shaft, cross the floor area, and get into the other elevator shaft on the same level above the first storey.

3. **Dispute**

The dispute between the Applicant and Respondent concerns the interpretation of the technical requirements of Clause 11.3.4.1.(1)(a), and Sentences 11.1.1.3.(1), 11.3.4.1.(3) and 11.3.4.1.(7) of the Building Code. At issue is the determination of whether to provide emergency power for low-rise elevators extending to the 4th storey.

4. **Provision of the Building Code**

Sentence 11.1.1.3.(1): Alteration or Repair

Except as provided in Sentence (2), where an existing building is subject to material alteration or repair, the Building Code is applicable only to those parts of the building that are subject to the material alteration or repair.

Clause 11.3.4.1.(1)(a): Reduction in Preformance Level

The preformance level of a building is reduced where proposed construction will result in the change of the major occupancy of all or part of an existing building to another major occupancy of a greater hazard.

Sentence 11.3.4.1.(3): Reduction in Performance Level

Where a major occupancy of all or part of an existing building is changed to another major occupancy and the hazard index of the new major occupancy is equal to or less than the construction index of the existing building, and where the early warning and evacuation systems requirements of other Parts of the Code for the new major occupancy exceed those of the existing systems, upgrading of those systems shall be required in conformance with the applicable requirements of Tables 11.3.1.A., 11.3.1.B. and 11.4.2.A.

Sentence 11.3.4.1.(7): Reduction in Performance Level

Where proposed construction will result in a change of major occupancy described in Clauses (1)(a) to (d), additional construction shall be required in order that the building or part of the building subject to the change of major occupancy conforms to the requirements of Subsection

3.2.6., Sections 3.6., 3.11. 9.5 and 9.7, Subsection 9.10.16., Sections 9.31 and 9.32, and Subsections 9.34.1., 9.34.2. and 9.34.3. as they apply to the new major occupancy that the building or part of the building is to support.

5. **Applicant's Position**

The applicant stated that there is no requirement under the Building Code to upgrade the elevators serving Floors 1 to 4 with emergency power.

It is the applicant's position that Sentence 11.1.1.3.(1) of the Building Code indicates the extent to which Code requirements which would apply to new construction may be imposed on existing building fabric where renovation occurs.

Subsection 11.3.4. of the Building Code provides for upgrading certain aspects of building fabric where there is a change in performance level of the building as a result of construction. The two aspects of construction which could engender a reduction in performance level are an increase in occupant load or a change in major occupancy.

A change to residential occupancy from office occupancy is considered to be a reduction in performance level and on this basis the requirements of Subsection 11.3.4. of the Building Code apply. This requires the Hazard Index (H.I.) of the proposed residential occupancy be compared to the Construction Index (C.I.) of the existing building.

Table 11.4.1.H. of the Building Code indicates that a high-rise apartment building has an H.I. of 7 and Table 11.4.1.A. indicates a C.I. of 7 for noncombustible construction providing a 2 hour fire-resistance rating for floor assemblies (such as would be expected with a 200 mm reinforced concrete floor slabs in 50/60 Holly Street).

Since the H.I. for the new residential use equals the C.I. for the existing construction, Sentence 11.3.4.1.(3) requires upgrading of early warning and evacuation systems to at east match new construction requirements. Specifically, Tables 11.3.1.A., 11.3.1.B., and 11.4.2.A. are referenced. None of these tables require the addition of emergency power for a fire fighters elevator or any other upgrading beyond early warning and excavation.

6. **Chief Building Officials Position**

The respondent stated that there is an increase in hazard by changing from an office to a residential occupancy.

Therefore, Sentence 11.3.4.1.(7) of the Building Code is applicable and an emergency power supply must be provided to the fire fighters' elevator serving Floors 1 to 4.

The building is considered one large high rise building, not two buildings. There must be continuity of fire fighters' elevators for all floors. Continuity for all floors must also be maintained for the emergency power supply.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that not providing emergency power to the elevators serving levels 1-4 complies with Sentence 11.3.4.1.(7) of the Building Code.

8. **Reason**

Since the renovation and change of occupancy occured on levels 1-4 only and not in the high rise portion, i.e. the portion of the building greater than 18 m, the high rise requirements in Section 3.2.6. are not applicable.

Mr. Robert Webb
Chief, Fire Prevention
City of Etobicoke
for the Respondent

RULING

1. **The Applicant**

   Memorial Gardens Canada Limited is the holder of a permit under the Building Code Act, 1992 to provide an Emergency Generator for water supply for fire fighting at the Glendale Memorial Gardens Mausoleum, 1810 Albion Road, Etobicoke, Ontario.

2. **Description of Constrution**

   The applicant is proposing to construct a two storey addition on top of an existing mausoleum. This will increase the building height to four storeys. The building is of noncombustible construction.

   The new addition will be separated from the existing building by a 2 hour fire separation. The first and second storeys are interconnected floor spaces. The new third and fourth storeys will also be interconnected.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Sentence 3.2.7.9.(4). of the Building Code. At issue is the need to provide an Emergency Generator for water supply for fire fighting.

4. **Provision of the Building Code**

   Sentence 3.2.7.9.(4). Emergency Power for Building Services

(4) An emergency power supply capable of operating under a full load for not less than 30 min shall be provided by emergency generator for water supply for fire fighting in conformance with Article 3.2.5.8. when the supply is dependent on electrical power supplied to the building and the building is not within the scope of Subsection 3.2.6.

5. **Applicant's Position**

The applicant stated that the design and the fire protection systems of the Mausoleum at the Glendale Memorial Gardens provide a performance level intended by the Building Code. The applicant respectfully requested the Building Code Commission rule on the sufficiency of compliance with the technical requirements of the Building Code for the following reasons:

1. The Mausoleum is a special use not envisioned by the Code, has a supervised intermittent occupancy and has a low hazard classification under NFPA-101 Life Safety Code. This classification suggests that lesser requirements than the Code, may be applicable.
2. The discharge pressure available at the topmost outlet of the standpipe and hose system without a booster pump is 50 psi, which is sufficient for such an occupancy of low hazard classification and contents of negligible fuel load and heat release rate. However, a fire pump is provided to boost the pressure so that a residual pressure of 65.3 psi is available at the required flow in the highest and most remote outlet. A fire department connection is also provided, although not required by the Code, to deliver the demand flow rate at the residual pressure of 65.3 psi if for any reason the power supply to the fire pump is not available during fire fighting operations. The static pressure available at the hydrant in front of the building is 68 psi. The City of Etobicoke has a reliable power supply and the fire department apparatus has a pumping capability to the topmost outlet of the standpipe system which is located 12 metres above ground.

   Hence, the water supply is not dependent on electrical power. Therefore, an emergency generator to supply emergency power to the fire pump is not required by NFPA-20 and the Building Code since the Code only requires emergency power when "the supply is dependent on electrical power supplied to the building".

3. The grid of smoke detectors which are above and beyond the Code requirements provide an excellent early warning and detection system for evacuation and early start of fire fighting operations.

6. **Chief Building Officials Position**

The respondent stated that the building requires a sprinkler system (per subsection 3.2.8.) and a stand pipe and hose system (per subsection 3.2.9.).

Due to the uniqueness of the building occupancy, the Chief Building Official has waived the requirement for sprinklers subject to the installation of a standpipe and hose system that conform to the Building Code.

The standpipe and hose system is required to be equipped with a water pump. In order to ensure an adequate water supply for fire fighting, Sentence 3.2.7.9.(4) of the Building Code requires an emergency power supply for the fire pump servicing the stand pipe and hose system.

The Fire Department provided information that unsatisfactory water pressure occurs frequently in the water mains within this area.

7. **Commission Ruling:**

n favour of the Applicant. It is the decision of the Building Code Commission that not providing emergency power for the standpipe fire pump shows sufficiency of compliance with the Building Code provided that the flame spread rating of the carpeting is not more than 25.

8. **Reasons:**
    1. The Mausoleum has a low combustible loading.
    2. A fire department siamese pumper connection has been installed on the standpipe system.
    3. The fire alarm system which includes smoke detectors is supervised.
    4. The fire safety plan will be designed to take into account that the standpipe system is not connected to an emergency power supply.

Dated at Toronto, this 19th day, in the month of September, in the year 1994, for application number 1994-33.

APPEARANCES

Mr. Regis Trudel
Senior Vice-President
Minto Developments Inc.
for the applicant

RULING

1. **The Applicant**

   Minto Developments Inc. are holders of a permit under the Building Code Act, 1992 to construct a single family dwelling (i.e. house) at 58 Wheaton Ave., City of Kanata.

2. **Description of Constrution**

   The applicant is constructing a two storey house with a full basement at 58 Wheaton Ave., Kanata, Ontario.

   The interior surface of foundation walls enclosing heated space are covered with insulation and vapour barrier extending from the underside of the subfloor to the finished floor level of the basement. The framing material, insulation and vapour barrier is installed tight against the foundation wall, floor slab below and floor framing above to reduce air circulation.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Articles 9.25.4.9. and 9.25.4.10. of the Building Code. At issue is the requirement to extend the insulation and vapour barrier from the underside of the subfloor to the finished floor level of the basement. The applicant proposes to terminate the insulation and vapour barrier not more than 380 mm (15 inches) above the finished floor level of the basement.

4. **Provision of the Building Code**

   Article 9.25.4.9. Extent of Insulation for Foundation Walls

   1. Except as permitted in Sentence (3), foundation walls enclosing heated space shall be insulated from the underside of the subfloor to the finished floor level of the basement.
   2. The insulation required by Sentence (1) may be provided by a system installed
      a. on the interior of the foundation wall,

b. on the exterior face of the foundation wall, or
c. partially on the interior and partially on the exterior, provided the thermal performance of the system is equivalent to that permitted in Clause (a) or (b).

3. Where the number of degree days for individual locations is 5000 or more, the insulation required in Sentence (1) shall extend from the underside of the subfloor and may terminate within not more than 380 mm (15 inches) above the finished floor level of the basement.
4. If a foundation wall is constructed of hollow masonry units, one or more of the following shall be used to control convection in the core spaces,
   a. filling the core spaces,
   b. at least one row of semi-solid blocks at or below grade,

      or

   c. other similar methods.

Article 9.25.4.10. Protection for Insulation Installed on the Inside Face of Foundation Walls

5. Insulation to be installed on the inside face of foundation walls below ground level shall be protected from moisture by a moisture barrier or shall be inherently impermeable to moisture and, if such insulation is of the batt-type it shall be protected from moisture by a moisture barrier and a vapour barrier.
6. Insulation on the inside of foundation walls described in Sentence (1) shall be installed tightly against the foundation wall and shall be sealed at the top and at the bottom to reduce air circulation.

5. **Applicant's Position**

The applicant stated that the full height basement insulation requirements of the Building Code have led to severe moisture problems in the basement.

Condensing moisture has accumulated at the base of the wall and seeped onto the basement floor. This has caused severe mold and mildew. Also, this build-up of moisture resulted in the deterioration of the associated building materials (i.e. insulation, wood framing and gypsum board).

The applicant proposed to terminate the insulation and vapour barrier not more than 380 mm (15 inches) above the finished basement slab to provide greater air circulation.

The applicant stated that their proposal would provide sufficiency of compliance with the energy objectives of the Building Code.

6. **Chief Building Officials Position**

The respondent stated that the Building Code clearly requires thermal insulation of basement walls to extend from the underside of the subfloor to the finished floor level of the basement.

Where the number of degree days is 5000 or more, the Building Code permits the thermal insulation of basement walls to terminate 380 mm (15 inches) above the finished floor level of the basement. The subject building is not in such an area. The 380 mm space allows heat loss through the foundation to prevent frost heaving and has the benefit of allowing moisture in the concrete to evaporate.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that terminating the insulation and vapour barrier not more than 380 mm (15 inches) above the finished basement floor slab shows sufficiency of compliance with the Building Code provided that the insulation is affixed in such a manner that it will not slip out of place.

8. **Reasons:**

This Type III house has been provided with a heat recovery ventilator which provides at least the equivalent energy benefit as a full height insulated basement.

Dated at Toronto, this 24th day, in the month of August, in the year 1994, for application number 1994-39.

RULING

1. **The Applicant**

   Lear Seating Canada is the holder of a permit under the Building Code Act, 1992 to construct a new truck shelter addition at Lear Seating Canada, 2700 Bristol Circle, Oakville, Ontario.

2. **Description of Constrution**

   The applicant is proposing to construct an addition to shelter not more than two transport trailers from the whether during the loading and unloading of material.

   The proposed addition is to be located at the loading dock area of an existing one storey building. The west side of the addition abuts the loading doors, the north and south exterior walls are clad with steel siding and the east side is open to the exterior with steel siding extending down to the underside of the roof structure.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Article 3.2.2.55. of the Building Code. At issue is the need to provide a sprinkler system for the new truck shelter addition.

4. **Provision of the Building Code**

   Article 3.2.2.55. Industrial Buildings, Division 2, Any Height, Any Area, Sprinklered

   1. A building classified as Group F, Division 2 shall conform to Sentence (2) provided the building

a. is not limited in building height,
b. is sprinklered, and
c. is not limited in building area.

5. **Applicant's Position**

The applicant stated that sprinklers need not be provided in the addition because the shelter is not an enclosed area, no flammable or hazardous materials will be stored inside, the tractor will protrude outside the building.

6. **Chief Building Officials Position**

The respondent stated that the Building Code clearing requires a sprinkler system in the proposed addition.

The respondent does not have the authority to accept a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

In favour of the Respondent. It is the decision of the Building Code Commission that not providing sprinkler protection in the addition does not comply with the Building Code.

8. **Reasons:**

If a fire should originate in the truck shelter, no provisions have been made to halt the spread of fire to the main building.

Dated at Toronto, this 19th day, in the month of September, in the year 1994, for application number 1994-38.

Terrafix Geosynthetics Inc.
for the Applicant

RULING

1. **The Applicant**

   Van Akker Homes (London) Ltd. is the holder of a permit under the Building Code Act, 1992 to construct a single family dwelling (i.e. house) at 495 Palmtree Avenue, London, Ontario.

2. **Description of Constrution**

   The applicant has constructed a single family dwelling (i.e. house) with a basement foundation. HITEK 20 Cordrain material is used as a drainage layer on below grade foundation walls.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Clause 9.14.2.1.(2.1)(c) of the Building Code. At issue is the use of HITEK 20 Cordrain as a drainage layer on below grade foundation walls in accordance with Section 9.14.

4. **Provision of the Building Code**

   Sentence 9.14.2.1.(2.1): Foundation Wall Drainage

   (2.1) The drainage layer required in Sentence (2) shall be provided by

   a. not less than 19 mm mineral fibre insulation with a density of not less than 57 kg/m3;
   b. not less than 100 mm of free drainage granular material; or,
   c. a system which can be shown to provide equivalent performance to that provided by the materials described in Clauses (a) or (b).

5. **Applicant's Position**

   The applicant stated that HITEK 20 Cordrain has been properly evaluated and in fact accepted as meeting Clause 9.14.2.1.(2.1)(c) and other Building Code provisions intended to keep basements dry.

6. **Chief Building Officials Position**

   The respondent stated that there was insufficient information to determine if the product provided equivalent performance to the materials specified in Clause 9.14.2.1.(2.1)(a) & (b). The material should be evaluated by the Canadian Construction Materials Centre.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that the use of HITEK 20 Cordrain as a drainage layer on below grade foundation walls shows sufficiency of compliance with the Building Code.

8. **Conditin:**

   The foundation walls shall be dampproofed or waterproofed in accordance with Section 9.13 of the Building Code.

9. **Reasons:**

   The "Demonstration of Full Height Basement Insulation Construction Methods" report prepared for the Ontario Home Builders' Association by Buchan, Lawton, Parent Limited tested a similar product and found it provided equivalent performance as 19 mm mineral fibre insulation and 100 mm of free drainage granular material.

For the applicant

RULING

1. **The Applicant**

   Ms. Rosa Degasperis is the holder of a permit under the Building Code Act, 1992 to construct a single family dwelling (i.e. house) at 11 Mulberry Mews, Thornhill, Ontario.

2. **Description of Constrution**

   The applicant constructed a detached single family dwelling (i.e. house) on property adjoining an Ontario Hydro Easement. The limiting distance between the north exposing building face of the dwelling and the adjacent property line is 0.33 m.

   The building was not constructed in accordance with the building permit drawings. The limiting distance between the building and the boundary separating the subject property and the Hydro Easement does not permit the existing glazed openings.

   There are no buildings or structures currently erected on the Hydro Easement.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Article 9.10.14.11. & 9.10.14.12 of the Building Code. At issue is the need to provide the required spatial separation between the subject building and any building that may in future be erected on the Hydro Easement.

4. **Provision of the Building Code**

   Article 9.10.14.11. & 9.10.14.12.:

   9.10.14.11. Construction of Exposing Building Face.

Except as permitted in Articles 9.10.14.12. to 9.10.14.16, each exposing building face and any exterior wall located above an exposing building face that encloses an attic or roof space shall be constructed in conformance with Table 9.10.14.B. and Subsection 9.10.8.

9.10.14.12. Exposing Building Face of Houses

1. For the purposes of application of this Article
    a. the exposing building face may be divided into any number of portions and the fire-resistance rating, type of cladding and glazed area limitations may be determined individually for each portion based on the limiting distance for each portion so divided,
    b. the exposing building face shall be taken as the projection of the exterior wall onto a vertical plane located so that no portion of the exterior wall of the building is between the vertical place and the line to which the limiting distance is established in Clause (a), and
    c. for the purpose of determining the actual percentage of glazed areas permitted in an exterior wall, the glazed area shall be projected onto the vertical plane established in Clause (b).
2. Except as required in Article 9.10.14.3., in building containing only dwelling units in which there is no dwelling unit above another dwelling unit, the requirements of Article 9.10.14.11. do not apply provided that the exposing building face has a fire-resistance rating of not less than 45 min where the limiting distance is less than 1.2 m (3 ft 11 in), and when the limiting distance is less than 0.6 m (23? in), the exposing building face is clad with noncombustible material.
3. Glazed areas in the exposing building face referred to in Sentence (1) shall not be permitted if the limiting distance is less than 1.2 m (3 ft 11 in) and shall be limited in conformance with the requirements for glazed areas in Table 9.10.14.A. where the limiting distance is 1.2 m (3 ft 11 in) or greater.
4. Where the spatial separation between dwelling units on adjoining properties is registered on the titles of both properties, the spatial separation may be calculated as if the dwelling units were constructed on the same property.

5. **Applicant's Position**

The applicant stated that the detached dwelling was not constructed in accordance with building permit drawings in that there is insufficient limiting distance between the exposing building face of the north exterior wall and the north boundary of the lot.

Pursuant to Section 9.10.14.12.(4) of the Building Code, the Applicant proposed to remedy the deficiency by entering into an agreement with the adjoining land owner which will be registered on title to the Applicant's property, and the adjoining lands to the north, that will ensure the required spatial separation.

6. **Chief Building Officials Position**

The respondent stated that although Sentence 9.10.14.12.(4) of the Building Code is not entirely applicable to the situation at hand, it does provide the basis for achieving sufficiency of compliance.

The respondent agreed with the proposal provided the adjacent land owner allowed a restrictive covenant to be imposed on his property that "guarantees the minimum spatial separation required by the Building Code".

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that entering into a restrictive covenant agreement registered on title for both properties as per the November 3, 1994 survey conducted by Helmut Piller, Ontario Land Surveyor (reference # 94-20-4886-01) shows sufficiency of compliance with the Building Code.

8. **Reasons:**

The property overlooks a main hydro corridor on provincially owned land and the likelihood of any future construction on this land is remote.

Dated at Toronto, this 10th day, in the month of November, in the year 1994, for application number 1994-46.

for the Applicant

RULING

1. **The Applicant**

   Braebury Homes is the holder of a permit under the Building Code Act, 1992 to construct a single family dwelling (i.e. house) at 1375 Braken Wood Drive, Kingston, Ontario.

2. **Description of Constrution**

   The applicant is constructing a house at 1375 Braken Wood Drive, Kingston, Ontario. The 14 riser stairway between the first and second floor consists of 2 risers leading to a landing, a 90 degree change in direction and 12 risers from the landing to the upper floor. The bottom two risers of the stairway do not have a handrail.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Sentence 9.8.7.1.(2) of the Building Code. At issue is the need to provide a handrail on the bottom two risers of the stairway between the first and second floors of the house.

4. **Provision of the Building Code**

   Sentence 9.8.7.1.(2): Required Handrails

   (2) Handrails are not required for stairs within dwelling units having not more than 2 risers, or for exterior stairs having not more than 3 risers and serving not more than one dwelling unit.

5. **Applicant's Position**

   The applicant stated that handrail is not required on a 2 riser set of stairs. The landing between floors creates two sets of stairs. (i.e. two riser stair and ten riser stair).

6. **Chief Building Officials Position**

The respondent stated that he could not accept the proposal that the Building Code intended to exempt the bottom 2 risers of every stairway from providing a handrail.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that not providing a handrail on the bottom two risers shows sufficiency of compliance with the Building Code.

8. **Reasons:**

   The stairway between the first and second floors of the house consists of 12 risers, a landing and two risers at the bottom with a 90 degree change in direction. The elimination of a handrail for the bottom two risers would not compromise the safety of those using this stairway.

Dated at Toronto, this 30th day, in the month of September, in the year 1994, for application number 1994-35.

APPEARANCES

Mr. Antoine Chalhoub
Antoine Chalhoub Architect
for the applicant

RULING

1. **The Applicant**

   Antoine Chalhoub Architect is the applicant for a permit under the Building Code Act, 1992 to construct a four storey self service storage building at 2720 Queensview Drive, Ottawa, Ontario.

2. **Description of Constrution**

   The proposed structure is a four storey self service storage building of noncombustible construction designed in accordnace with Article 3.2.2.52. of the Building Code. The building faces two streets and has a building area of 1985 m?. It is fully sprinklered, equipped with a fire alarm system and 24 hour surveillance cameras on each floor.

   The upper two floors of the building are used as an open space with 7 feet high metal partitions for self storage lockers. The corridor walls are not built continuous from the floor to the underside of the floor above, the ceiling or the roof.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Clause 3.10.2.4.(2)(c) of the Building Code. At issue is the requirement to construct the public corridor walls continuously from the floor to the underside of the floor above, the ceiling or the roof.

   The applicant contended that 7 feet high metal partitions are adequate because the building is sprinklered, equipped with a fire alarm system connected to the fire station, cameras provide 24 hour surveillance, and smoke exhaust system.

4. **Provision of the Building Code**

   Sentence 3.10.2.4.(2) Safety Requirements Within Floor Areas For Self-Storage Buildings

(2) A corridor need not be constructed as a public corridor where the travel distance, measured from inside the rental space to the nearest exit, is not more than 15 m provided that the corridor walls

a. are of noncombustible construction,
b. have no openings other than doors and the doors are of solid construction, and
c. are continuous from the underside of the floor above, the ceiling or the roof.

5. **Applicant's Position**

The applicant stated that the design of the upper two storeys showed sufficiency of compliance with the Building Code.

The entire building is sprinklered and there is never more than 3 - 5 persons on a floor area. The fire protection system (i.e. cameras, smoke detectors, heat detectors and sprinklers) are connected directly to the fire station and a smoke exhaust system has been provided.

This system has been used for more than 8 years in six similar buildings with excellent results and efficiency.

6. **Chief Building Officials Position**

The respondent stated that the Building Code states that the corridor need not be constructed as a public corridor where the travel distance measured from the rental space to the nearest exit is not more than 15 m provided that the corridor walls are continuous from the floor to the underside of the floor above, the ceiling or the roof.

The respondent said he did not have the authority to accept the proposal even though the building has a low occupant load, suppression system, central fire alarm system and 24 hour surveillance.

The use of equivalents regulated by Section 2.7 of the Building Code is not applicable.

7. **Commission Ruling:**

In favour of the Applicant . It is the decision of the Building Code Commission that 7 ft. high noncombustible partition walls in the public corridors in this sprinklered building shows sufficiency of compliance with the Building Code.

8. **Reasons:**

1. The travel distance to an exit from anywhere in the floor area is 15 m or less.
2. There are no dead end public corridors.
3. By providing an automatic sprinkler system the size of the fire and thereby the amount of smoke produced will be controlled.
4. The ultimate control over the building including its use and occupancy rests with the building management and not with the individual lessees.

Dated at Toronto, this 29th day, in the month of August, in the year 1994, for application number 1994-34.

DATE OF RULING

August 29, 1994

APPEARANCES

Joan Moreau, Owner
Désirée Custom Made Drapes
for the applicant

RULING

1. **The Applicant**

   Désirée Custom Made Drapes is the holder of permit under the Building Code Act, 1992 to construct a front and rear addition to an existing building at 1132 Cassells Street, North Bay, Ontario.

2. **Description of Constrution**

   On September 28th, 1994 a building permit was issued to construct an addition to the front of an existing house.

   The front addition was for personal service occupancy and included a new entrance. The new entry provided access to a split level landing with stairs leading to the basement and first floor. The Building Department deemed the first floor to be the entrance storey since the new entrance only provided access onto the landing.

   The Building Department agreed to permit a ramp providing barrier free access through a proposed rear addition.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns an interpretation of Article 3.7.1.2. of the Building Code. The purpose of the hearing was to determine whether the new main entrance to D,sir,e Custom Drapes satisfies the Barrier Free Design requirements of Section 3.7 of the Building Code.

4. **Provision of the Building Code**

   Article 3.7.1.2. Entrances

   1. Except as required in Sentence (2), every building in Article 3.7.1.1. shall have at least one entrance intended for general use by the public or the occupants designed in

conformance with Article 3.7.3.3. and opening to the outdoors at sidewalk level or a ramp conforming to Article 3.7.3.4. leading to a sidewalk.

2. Where a suite of Group A, D or E occupancy is contained on the first storey to which a barrier-free path of travel is provided, and is completely separated from the remainder of the building so that three is no access to the remainder of the building, such suite shall have at least one barrier-free entrance in conformance with Sentence (1).

5. **Applicant's Position**

The applicant stated that the entrance to the front addition complied with the Barrier Free Design requirements of s. 3.7 of the Building Code.

The applicant said that a wheelchair can enter through the main entrance door and come into the store without any difficulty. Once inside there are doorbells accessible to all customers to ring for service.

A wheelchair can easily turn around and exit the landing area. From the entrance landing a person can view the entire showroom and displays. All samples, books, displays and fabric can be brought to the customer.

A shop at home service is also offered where appointments are made and samples are taken to the customers home.

The applicant disputed the provision of a ramp at the rear addition. Besides being an insurmountable expense, it would never be used. Also, persons using the ramp would have to travel through private living quarters to access the store. With a maximum gradient of 1 in 12, over forty feet would be required for the ramp. This would eliminate the customer parking area.

6. **Chief Building Officials Position**

The respondent stated that he does not have the authority to omit, exclude or deviate from the Building Code. Article 3.7.2.1. of the Building Code clearly requires barrier free access be provided to the entrance storey.

The use of equivalents regulated by Section 2.7 of the Building Code is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that the new main entrance to D,sir,e Custom Drapes shows sufficiency of compliance with the Building Code.

8. **Reasons:**
    1. The nature and size of the business is such that most of the business is conducted at the customers' home. This location is incidental to the main operation.
    2. The major use of this building is residential (i.e. the owner lives on site).
    3. The merchandise on display can be adequately viewed at the entrance landing which is accessible.

APPEARANCES

Mr. Levino Tittaferrante, President
I.H.I.W. Corporation
for the applicant

RULING

1. **The Applicant**

   I.H.I.W. Corporation is the applicant for a permit under the Building Code Act, 1992 to change the use of a building from a door and door hardware supply and warehouse facility to a furniture store at 1156 Alloy Drive, Thunder Bay, Ontario

2. **Description of Constrution**

   The existing 25,000 sq. ft. (2,323 m?) one storey building was constructed in 1992 as a Group F Division 2 (F-2) major occupancy. It was designed to the requirements of Article 3.2.2.52. of the Building Code for industrial buildings, division 2, up to 4 storeys in building height. The building is not sprinklered.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the interpretation of Article 3.1.2.1. and Article 1.1.3.2. (i.e. the definition of Medium Hazard Industrial Occupancy and Mercantile Occupancy) of the Building Code. At issue is whether the existing F-2 classification of the building is applicable to the proposed use as a furniture store.

   If the building remains classified as a Group F Division 2 major occupancy it does not require a sprinkler system. However, if the building is classified as a Group E major occupancy, sprinklers are required.

4. **Provision of the Building Code**

   Article 1.1.3.2. Definitions of Words and Phrases

   Industrial Occupancy means the occupancy or use of a building or part thereof for the assembling, fabricating, manufacturing, processing, repairing or storing goods and materials.

Medium Hazard Industrial Occupancy (F-2) means an industrial occupancy in which the combustible content is more than 50 kg/m? or 1200 MJ/m? of floor area and not classified as high hazard industrial occupancy.

Mercantile Occupancy (E) means the occupancy or use of a building or part thereof for the displaying or selling of retail goods, wares of merchandise.

Article 3.1.2.1. Classification of Buildings

1. Except as provided in Article 3.1.2.3. to 3.1.2.6., every building or part thereof shall be classified according to its major occupancy as belonging to one of the Groups or Divisions described in Table 3.1.2.A.
2. A building intended for use by more than one major occupancy, shall be classified according to all major occupancies for which it is used or intended to be used.

5. **Applicant's Position**

The applicant stated that Part 3 of the Building Code does not specifically name furniture stores in the Group E classification.

The existing building was classified as a Group F-2 and used as a hardware store.

The applicant stated that the building department used Part 11 definition for determining Group E. He said that if he could use Part 11 of the Building Code he could match existing since the hazard index does not increase.

Also sited was the fact that other furniture stores in Thunder Bay are not sprinklered.

The applicant stated that the F-2 classification applied to the new use and occupancy of the building. Since it is intended to sell furniture from prototypes displayed in the showroom, the building should not be considered as a Group E, but rather a Group F occupancy. The applicant felt that in a Group E occupancy furniture is sold directly from the showroom floor.

6. **Chief Building Officials Position**

The respondent stated that the intended use of the building as a retail furniture store would indicate that the building be classified as a Group E occupancy.

Therefore, the provision of the Building Code in dispute is Article 3.2.2.44. for a Group E, Mercantile occupancy. It requires the building to be sprinklered.

Part 11 of the Building Code could not be used to address concerns related to this project because the original building was built in 1992 (i.e. it is less than 5 years old).

Existing unsprinklered furniture stores referred to by the applicant were designed as Group E occupancies. The buildings met the requirements for unsprinklered buildings in accordance with Articles 3.2.2.43. and 3.2.2.44. of the Building Code.

7. **Commission Ruling:**

In favour of the Respondent. It is the decision of the Building Code Commission that the occupancy classification for the 25,000 sq.ft. one storey furniture store be an "E" mercantile occupancy.

8. **Reasons:**

It is the intent of the Building Code that Group "E" mercantile occupancies be buildings and/or parts of buildings where the public can enter to view and/or purchase goods while Group "F-2" storage occupancies be buildings or parts of buildings where the general public is not permitted to enter.

Dated at Toronto, this 29th day, in the month of August, in the year 1994, for application number 1994-27.

Mr. Anthony Boyko
Manager, Building Inspection
Town of Markham
for the respondent

NOTE

The hearing was adjourned on August 18th, 1994 pending a site visit of the outdoor deck and was reconvened on September 29th, 1994.

RULING

1. **The Applicant**

   Brown Bay Development is the holder of a permit under the Building Code Act, 1992 to construct an outdoor deck to be used as a patio for customers of Bentley's Seafood Restaurant, 8220 Bayview Avenue, Thornhill, Ontario.

2. **Description of Constrution**

   The applicant constructed a raised uncovered exterior platform (patio) in the parking lot in front of an existing twenty year old restaurant. The structure is comprised of an open floor area and is not attached to the existing building. The platform is accessible by a stair containing three risers. The structure serves as an outdoor patio for the restaurant.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Sentence 3.7.1.2.(1) of the Building Code. At issue is the need to provide a barrier-free entrance to subject platform.

4. **Provision of the Building Code**

   Sentence 3.7.1.2(1) Entrances:

Except as required in Sentence(2), every building in Article 3.7.1.1. shall have at least one entrance intended for general use by the public or the occupants designed in conformance with Article 3.7.3.3. and opening to the outdoors at sidewalk level or to a ramp conforming to Article 3.7.3.4 leading to a sidewalk.

5. **Applicant's Position**

The applicant stated that the structure in question is a seasonal outdoor deck built in the parking lot in front of an existing twenty-two year old restaurant.

The plaza in question, located at 8220 Bayview Ave., is over twenty years old and does not provide barrier free access.

When the structure was built, the fact that the restaurant itself has no barrier free access nor does it have handicapped washroom facilities, lead the owners to believe that no barrier free access was necessary for the deck as it was merely an addition to the existing restaurant to be used in the summer months only.

Access to the walkway of the mall is difficult due to the high curb in the parking lot, while the entrance to the restaurant itself is at least twelve inches above the walkway.

It is the position of the owners that they in no way sought to circumvent the Building Code, however in this case where a seasonal structure has been added to an existing restaurant that does not provide barrier free access or handicapped washroom facilities, it appears unreasonable that the structure alone would require barrier free access.

The deck is part of the restaurant and is used exclusively for dining. When the Liquor Licensing Board issued the restaurant's liquor license it took into account the existing washroom facilities in determining the customer load for the deck rather than issuing a separate license.

Should the owners be required to modify the deck, it will require the use of an additional four parking spots, and the expenditure of thousands of dollars to make the necessary changes.

6. **Chief Building Officials Position**

The respondent stated that people electing to sit on the platform area must do so by using a stair containing 3 risers. The platform was newly constructed and therefore must comply with Part 3

of the Building Code. Specifically the platform/building requires at least one entrance at the sidewalk level or a ramp conforming to Article 3.7.3.4. leading to a sidewalk.

7. **Commission Ruling:**

   n favour of the Respondent. It is the decision of the Building Code Commission that not providing a barrier free entrance to the patio on the platform does not comply with the Building Code.

8. **Reasons:**
   1. A site visit indicated that access is available to the walkway of the mall.
   2. The patio is new construction and requires barrier-free access.

Dated at Toronto, this 29st day, in the month of September, in the year 1994, for application number 1994-30.

Michael Wong

PLACE

Toronto, Ontario

DATE OF RULING

August 18, 1994

APPEARANCES

Mr. Leonard Koffman, Architect
for the applicant

RULING

1. **The Applicant**

   Truscan Realty Ltd. is an applicant for a permit under the Building Code Act, 1992 to construct a series of concrete ramps in a barrier-free path of travel along an existing exterior walkway providing access to various commercial tenants, "Towngate" Shopping Centre, 2446 Bank Street, Ottawa, Ontario.

2. **Description of Constrution**

   The applicant is proposing to replace approximately one third the width of five existing concrete stairways with ramps to provide a barrier-free path of travel along an existing open-air exterior walkway. The walkway provides access to several tenants of the "Towngate" Shopping Centre.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the technical interpretation of Clause 3.7.3.4.(1)(e) of the Building Code. At issue is the requirement to provide guards and handrails on both sides of the ramps.

4. **Provision of the Building Code**

   Clause 3.7.3.4.(1)(e) Ramps

   Ramps located in a barrier-free path of travel shall:

   (e) except as provided in Sentence (2), be equipped with handrails and guards on both sides conforming to Articles 3.4.6.4. and 3.4.6.5.

5. **Applicant's Position**

   The applicant requested that handrails not be required for the subject ramps. The ramps serve to overcome a grading problem resulting from land settlement adjacent to the exterior walkway. Barrier-free access was originally provided via curb cuts from the parking area, but due to soil

settlement this is no longer possible. The proposed ramps replace the curb cuts. It was the feeling of the applicant that guards and handrails on both sides of the ramps would be an intrusion in the walkway that may be hazardous to the general public.

6. **Chief Building Officials Position**

   The respondent stated that Sentence 3.7.3.4.(3) of the Building Code requires "Floors or walks in a barrier-free path of travel having a slope steeper than 1 in 20" to be designed as ramps. Since the subject exterior walkway forms part of the barrier-free path of travel from the exterior parking area to the building entrances, the ramps must comply with Sentence 3.7.3.4.(3). This would then require the provision of handrails and guards in accordance with Clause 3.7.3.4.(1)(e) of the Building Code.

7. **Commission Ruling:**

   In favour of the Respondent. It is the decision of the Building Code Commission that the absence of guards and handrails on both sides of the ramps does not comply with the Ontario Building Code.

8. **Reasons:**

   Not providing the guards and handrails may:

   a. cause undue hardships to those that rely on their use to access the individual stores, and
   b. the difference in grade between the stairs and the ramps may be hazardous to the general public if no barrier is provided.

Dated at Toronto, this 18st day, in the month of August, in the year 1994, for application number 1994-32.

APPEARANCES

Mr. Kevin Wheaton
J. Stuart Hall & Associates Ltd.

RULING

1. **The Applicant**

   M-Con Products Inc. is an applicant for a permit under the Building Code Act, 1992 to construct an addition to a precast concrete plant at 2150 Richardson Side Road, Carp, Ontario.

2. **Description of Constrution**

   The applicant is proposing to construct a 890 m? (9,581 ft?) addition to an existing 3058 m? (32,917 ft?) precast concrete plant.

   The existing building is a single storey structure of combustible and non combustible construction. The building is classified as a Group F, Division 3 (F-3) major occupancy. It is not sprinklered and faces 3 streets. There is no municipal water supply to the site.

   Documentation provided by the Chief Building Official indicates the building was erected in three phases:

   - **1988 Phase 1** 1943 m²
   - **Phase 2** 515 m²
   - **Phase 3** 600 m²
   - **1994 Phase 4 (proposed)** 890 m²
   - **Total** 3948 m²

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Clause 3.2.9.1.(1)(b) and Table 3.2.9.A. of the Building Code. At issue is the requirement to provide a standpipe and hose system in the proposed addition. Table 3.2.9.A. which forms part of Sentence 3.2.9.1.(1) requires a standpipe and hose system for one storey F-3 occupancies over 3000 m?.

4. **Provision of the Building Code**

   Sentence 3.2.9.1.(1) Requirement for Standpipe and Hose Systems

   Except as provided in Article 3.2.9.2., a standpipe and hose system shall be installed in every building that:

a. is more than
    i. 3 storeys in building height, or
    ii. 14 m in height measured between grade and the ceiling of the uppermost storey,
b. is greater in building area than the area shown in Table 3.2.9.A. for the applicable building height shown in the Table where the building
    i. is not sprinklered, and
    ii. is not more than 14 m high measured between grade and the ceiling of the top storey, or
c. contains more than one storey below grade.

Table 3.2.9.A.

5. **Applicant's Position**

The applicant stated that the level of safety required by the Building Code is met without the provision of a standpipe and hose system for the following reasons:

0. The building is a precast concrete plant with minimal combustible load;
1. Construction is non-combustible;
2. The owner does not intend to increase the number of workers in the building;
3. The maximum travel distances in the existing building and the addition comply with the Building Code;
4. The building is visited annually by a fire inspector;
5. The shop floor and the mezzanine are provided with fire extinguishers as per the Building Code. The extinguishers are checked two or three times each year.
6. The building is one storey in height, as the mezzanine complies with Sentence 3.2.1.1.(4) of the Building Code.
7. The Building Official agrees that the proposal is reasonable.

6. **Chief Building Officials Position**

The respondent stated the provision of fire extinguishers does not provide an alternative means of fire suppression. Fire extinguishers are required by Article 3.2.5.17. of the Building Code regardless of whether a standpipe and hose system is provided. Furthermore, Sentence 3.2.9.4.(7) requires a listed fire extinguisher to be located in each hose cabinet.

The respondent does not have the authority to issue a building permit for a condition that deviates from the Building Code. The use of equivalents regulated by Section 2.7 of the Building Code is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that not providing a standpipe and hose system shows sufficiency of compliance with the Building Code provided:

0. Double the required number of fire extinguishers is provided in the new addition; and,
1. All plant personnel are trained in the proper use of fire extinguishers and a refresher course is given annually.

8. **Reasons:**

0. The building is of noncombustible construction occupied by a precast products manufacturer where the fire load is low.
1. The building is situated in a rural area with no water supply. It is standard procedure for the fire department to respond to a fire with their own water supply.

Dated at Toronto, this 21st day, in the month of July, in the year 1994, for application number 1994-21.

DATE OF RULING

July 21st, 1994

APPEARANCES

Mr. Gary Chu
Dow Chemical Canada Inc.,

For the applicant

Mr. Fraser MacDonald
Chief Building Official
Township of Ops

RULING

1. **The Applicant**

   Bradscot Northern Construction are holders of a permit under the Building Code Act, 1992 to construct an elementary school in the hamlet of Little Britain, Township of Mariposa.

2. **Description of Constrution**

   The applicant is constructing an elementary school which is classified as a Group A, Division 2 major occupancy. The exterior wall of the building is comprised of 190 mm concrete block, 90 mm styrofoam Cavitymate insulation, 20 mm air space and 100 mm of brick veneer.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Sentences 3.1.11.2.(1)&(2) of the Building Code. At issue is the requirement to fire stop the 20 mm concealed space in the exterior wall assembly.

4. **Provision of the Building Code**

   Sentences 3.1.11.2.(1)&(2) Fire Stopping in Wall Assemblies (1) Except as permitted in Sentence (2), fire stops conforming to Article 3.1.11.7. shall be provided to block off spaces within a wall assembly: (a) at every floor level; (b) at every ceiling level where the ceiling forms part of an assembly required to have a fire-resistance rating; and, (c) so that the maximum horizontal dimension is not more than 20 m and the maximum vertical dimension is not more than 3 m. (2) Fire Stopping conforming to Sentence (1) are not required provided: (a) the wall space is filled with insulation; (b) the exposed construction materials and any insulation within the wall space are noncombustible; or, (c) the exposed construction materials and any insulation

within the wall space have a flame-spread rating of not more than 25 on any exposed surface or on any surface that would be exposed by cutting through the material in any direction and fire stops are installed so that the vertical distance between them does not exceed 10 m.

5. **Applicant's Position**

The applicant provided the following information to demonstrate sufficiency of compliance with the fire stopping requirements for concealed spaces within the wall assembly: (1) Sentence 3.1.11.2.(2) of the National Building Code of Canada (NBCC) was amended January 1993 by an additional exception to the fire stopping requirement: "(d) the insulated wall assembly contains not more than one concealed air space, and the horizontal thickness of that air space is not more than 25 mm."; (2) The Building Code Commission ruled in favour of a similar application on December 20, 1993 (i.e. R93-21-377); (3) The Flame Spread Classification determined by CAN/ULC S102.2- M88 is ineffective for fire stopping requirements because field conditions differ from the test and poor reproducibility of test results; and, (4) Research indicates that ventilation in the concealed space influences the spread of fire. Therefore, the concealed space must have an adequate supply of oxygen for combustion. The critical width of the concealed space was said to be approximately 25 mm.

6. **Chief Building Officials Position**

The respondent stated that the Building Code clearly requires fire stopping in the wall assembly. Concern was expressed about the potential spread of fire within the wall cavity and the difficulty this could present to fire fighters trying to extinguish the fire.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that insulation in excess of a 25 flame spread rating within the wall space of a building with no fire stopping, provided that there is only one concealed air space that is not more than 25mm thick, shows sufficiency of compliance with the Building Code.

8. **Reasons:**

1. Tests conducted at the National Research Council indicated that the thickness of the air space is the critical factor in determining flame spread in a wall cavity. 2. An emergency amendment to the fire stopping requirement in the National Building Code was approved in 1993, based on the

tests conducted at the National Research Council. 3. The building is a one storey school, occupied by well trained staff who would immediately react to any fire condition.

Dated at Toronto, this 21st day, in the month of July, in the year 1994, for application number 1994-29.

APPEARANCES

Mr. James Barclay, President
Barclay Construction Hamilton Limited,
for the Applicant

Al Mattiussi, Vice-President
Nelson Steel Co. Ltd.,
for the Applicant

RULING

1. **The Applicant**

   Nelson Steel Co. Ltd. are applicants for a permit under the Building Code Act, 1992 to construct a pickling line and storage area addition to an existing coil steel processing plant, located at 19 Hawk Street, City of Nanticoke, Ontario.

2. **Description of Construction**

   The applicant is proposing to construct a 7,158 m? pickling line and storage area addition to an existing coiled steel processing plant and office. The building is of non-combustible construction and is not sprinklered.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Sentence 3.2.9.1.(1) and Table 3.2.9.A. of the Building Code. At issue is the requirement to provide a standpipe and hose system in the proposed pickling line and storage area addition.

4. **Provision of the Building Code**

   Sentence 3.2.9.1.(1) Requirement for Standpipe and Hose Systems Except as provided in Article 3.2.9.2., a standpipe and hose system shall be installed in every building that:

   (a) is more than
   (i) 3 storeys in building height, or
   (ii) 14 m in height measured between grade and the ceiling of the uppermost storey,

(b) is greater in building area than the area shown in Table 3.2.9.A. for the applicable building height shown in the Table where the building

(i) is not sprinklered, and
(ii) is not more than 14 m high measured between grade and the ceiling of the top storey, or (c) contains more than one storey below grade.

Table 3.2.9.A.

5. **Applicant's Position**

The applicant stated that the only risk of fire in the pickling plant is from an oil or hydraulic fire and extinguishment with water would further spread a fire and endanger personnel. Also, since the steel coil storage area is non-combustible without wood pallets, packaging or other combustible materials the standpipe and hose system is not necessary.

In order to provide equivalent level of performance, the applicant proposes the use of fire extinguishers and proper training of the staff to deal with fire situations.

6. **Chief Building Officials Position**

The respondent stated that the Building Code clearly requires a stand pipe and hose system in the proposed addition.

The respondent does not have the authority to issue a building permit for a condition that deviates from the Building Code. The use of equivalents regulated by Section 2.7 of the Building Code is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that not providing a wet standpipe and hose system shows sufficiency of compliance with the Building Code, subject to a dry standpipe system being provided with the following features:

1. The siamese pumper connection is located within 45 m of a hydrant.

2. A plaque be installed over the siamese connection clearly identifying that the siamese connection is for a dry standpipe system in the new addition.

3. The location of hose stations shall comply with Section 3.2.9. of the Building Code; however, hose lines shall not be provided.

8. **Reasons:**

1. The dry standpipe system is intended to be used by fire department personnel only in the event that internal fire fighting is required.

2. The process and storage areas have a low combustible loading.

3. Plant personnel will be trained in the use of fire extinguishers that will be installed in the new addition, in numbers that exceed Fire Code requirements.

Dated at Toronto, this 21st day, in the month of July, in the year 1994, for application number 1994-25.

DATE OF RULING

September 29, 1994

APPEARANCES

Vish Bhapkar, Manager
Architectural/Structural Plans
Examination Section

City of Scarborough
for the Respondent

ADJOURNMENTS The hearing was adjourned on July 7th, 1994 pending the reconciliation of two geotechnical reports or a site specific soil analysis, and was reconvened on August 18th, 1994.

The hearing was adjourned on August 18th, 1994 due to an unsigned report being submitted by the Applicant's agent as evidence. The hearing was reconvened on September 29th, 1994.

RULING

1. **The Applicant**

   Herbert and Almut Didszun are applicants for a permit under the Building Code Act, 1992 to reconstruct a fire damaged house on existing masonry foundation walls, located near the crest of the Scarborough Bluffs at 7 Springbank Avenue, Scarborough, Ontario.

2. **Description of Construction**

   The applicant is proposing to reconstruct a two storey single family dwelling that was destroyed by fire. The new dwelling is to be reconstructed on the existing foundation with no additional excavation. An independent structural review found the existing foundation to be satisfactory. The site is situated near the edge of the Bluff which is approximately 53 metres (174 ft.) above the present Lake Ontario shore line.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the interpretation of the technical requirements of Article 9.4.4.4. and Sentence 4.1.1.3.(1) of the Building Code. At issue is the close proximity of the dwelling to the edge of the bluff with respect to slope instability, potential ground loss and building movement.

4. **Provision of the Building Code**

   Article 9.4.4.4. Soil Movement

Where a foundation is located in an area in which soil movement caused by changes in soil moisture content is known to occur to the extent that it will cause significant damage to a building, measures shall be taken to minimize the affect of such movement on the building.

Sentence 4.1.1.3.(1) Design Requirements

Buildings and their structural members including formwork and falsework shall be designed to have sufficient structural capacity and structural integrity to resist safely and effectively all loads and effects of loads and influences that may reasonably be expected, having regard to the expected service life of building, and shall in any case satisfy the requirements of this Section.

5. **Applicant's Position**

The applicant submitted geotechnical reports that showed the soil erosion effects on the proposed dwelling would not create an unsafe condition within the present and foreseeable future.

6. **Chief Building Officials Position**

The respondent stated that the geotechnical reports submitted by the applicant do not adequately address the following:

(a) The existing foundation is located in a high risk zone with respect to slope instability, potential ground loss and building movement;

(b) The proposed work would contravene Sentence 4.1.1.3.(1) and Article 9.4.4.4. of the Building Code; and,

(c) The reconstructed building would be structurally inadequate and lead to a potentially unsafe condition.

Furthermore, the respondent said the conclusions in the geotechnical report are qualified by an emphasis placed on the preliminary nature of the report and assumptions relied on to arrive at these conclusions.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that based on the documentation submitted that the reconstruction of the new house on the existing foundation shows sufficiency of compliance with the Building Code.

8. Conditions:

(1) The following reports shall be registered on the title of the subject property:

i) Solmers International, Geotechnical Review, Slope at 7 Springbank Avenue, Scarborough, Ontario, File SI0 941117, dated June 13, 1994. Report signed by M. Bernardi, P.Eng.

ii) Sarafinchin Associates Ltd., Slope Review 7 Springbank Avenue, Scarborough, Ontario, Project T1208/R1, dated March 4, 1994. Report signed by Larry Galimanis, P.Eng. and Murray Sarafinchin, M.A.Sc., P.Eng.

iii) Jagger Hims Limited, Addendum Report, Review of Geotechnical Reports, Slope at 7 Springbank Avenue, Scarborough, Ontario, File 94578.00, dated September 9th, 1994. Report signed by Andrew G. Hims, P.Eng.

(2) Adequate precautions shall be taken so that no further deterioration of slope stability occurs. This included: i) All heavy equipment, trucks, storage supplies and the like, used in demolition and construction operations must be kept a distance of at least 25 metres from the crest of the embankment. This will reduce overloading of the crest of the slope.

ii) Excavation operations will be kept to a minimum and will be carried out manually.

iii) All compaction operations are to be carried out with hand-operated equipment without vibration to reduce the risk of soil disturbance at the crest of the slope.

iv) The site must be well drained at all times. Surface water run-off resulting from rain, snow melt, etc., must be diverted away from the crest of the slope towards the street. A series of french drains, strategically placed across the site, may be required.

v) New filtered weeping tiles are to be installed at the perimeter of the house.

vi) The existing septic system is to be relocated to the north of the structure or drainage to be adequately diverted to the municipal sewer system.

vii) The crest of the slope where water erosion occurred during firefighting operations, must be reinstated to its previous configuration prior to the commencement of any construction. Backfilling operations in this sensitive area must be carried out carefully, with a series of conveyors to reduce the potential for disturbance. The backfill material must be free-draining.

(3) A professional geotechnical engineer shall be engaged to conduct a field review to ensure the aforementioned condition number (2) is met.

9. Reasons:

(1) The proposed reconstructed house will be identical to the one destroyed by fire. (2) Adequate precautions will be taken to ensure no further slope instability occurs.

Dated at Toronto this 29th day in the month of September in the year 1994 for application number 1994-22.

PANEL

Sarah Maman, Chair
Remus Tsang
Sang Shim

PLACE

Toronto, Ontario

DATE OF RULING

July 7th, 1994

RULING

1. **The Applicant**

David and Cathy Porco are the holders of a permit under the *Building Code Act, 1992* to construct a cottage at 2609 Tiller Lane, R.R.# 2, Kingston, Ontario.

2. **Description of Construction**

The applicant constructed a summer cottage with a cathedral ceiling. The ceiling construction consists of 38mm x 235mm roof joists spaced 600mm on center. The applicant installed Heatlok R240, site manufactured spray-in-place rigid cellular plastic thermal insulation to the under side of the roof sheathing. A ventilation space was not provided between the insulation and the roof sheathing.

3. **Dispute**

The dispute between the Applicant and Respondent concerns sufficiency of compliance with Sentence 9.19.1.3.(2) of the Building Code. At issue is the lack of a ventilated space between the underside of the roof sheathing and the top of the insulation throughout the joist space.

4. **Provision of the Building Code**

Sentence 9.19.1.3.(2) Cross Purlins

Cross purlins required by Sentence (1) may be omitted where the roof slope is 1 to 6 or steeper provided the roof framing members run in the same direction as the roof slope and a minimum clearance of 75 mm is maintained between the underside of the roof sheathing and the top of the insulation throughout the length of the roof joist.

5. **Applicant's Position**

The applicant stated that it is normal procedure for insulation installers to spray Heatlok R240 directly to the underside of roof sheathing without providing an air space for ventilation. This product was designed to be sprayed directly to clean surfaces and once cured forms a permanent airtight seal. Sentence 9.19.1.3.(2) of the Building Code was written for the purpose of addressing conventional fibreglass insulation. It did not take into account technological advances in building materials such as Heatlok R240.

6. **Chief Building Officials Position**

The respondent stated that the Building Code clearing requires a minimum clearance of 75 mm between the underside of the roof sheathing and the top of the insulation.

The respondent does not have the authority to accept a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

In favour of the APPLICANT. It is the decision of the Building Code Commission that the material used in the manner constructed shows sufficiency of compliance with the Building Code provided that:

(a) Two coats of vapour barrier paint are applied to the under side of the ceiling.

(b) All penetrations in the ceiling membrane such as for light fixtures must be adequately sealed off.

(c) Sufficient humidity control fans should be provided in the ceiling space which will activate automatically when the relative humidity exceeds 40%.

(d) An exhaust fan controlled by a dehumidistat should be installed on the ceiling in the area near the bathroom or kitchen.

Dated at Toronto this 7th day in the month of July in the year 1994 for application number 1994-24.

Mr. Joe Wintar, Building Engineer,
City of Burlington for respondent

DATE OF RULING

July 7th, 1994

RULING

1. **The Applicant**

   Reimer Construction Limited is the holder of a permit under the *Building Code Act, 1992* to construct alterations to a fifth floor office space at Reimer Corporate Tower, 5420 North Service Road, Burlington, Ontario.

2. **Description of Construction**

   The applicant constructed alterations to approximately half of the fifth level (i.e. 13,000 square feet) to accommodate a Data Centre operation for Commcorp Financial Group (Division of the Canadian Imperial Bank of Commerce). The Data Centre computer room occupies approximately 3,100 square feet. It was designed to have a 14 inch high raised computer floor however, during construction a 12 inch raised floor was installed. The result was a two step riser for the flight of stairs serving the printer room.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Article 3.4.6.2. of the Building Code. At issue is an interior flight of stairs with only two risers serving a 12 inch raised floor in the printer room.

4. **Provision of the Building Code**

   Article 3.4.6.2. Minimum Number of Risers

   Every flight of interior stairs shall have at least 3 risers.

5. **Applicant's Position**

The applicant provided the following reasons for requesting the two riser stairs be permitted in lieu of constructing a ramp:

(a) The printer room has been strategically designed with equipment laid out in the most feasible, workable configuration for the customer, taking into consideration the floor loading requirements. If a ramp was installed it would be completely blocked by a printer machine making the ramp inaccessible and non-functional.

(b) The printer room has 75 foot candle lighting level. The room and stairs are visible and quite lit up. There is controlled access to the computer facility and it is manned by two full time operators per eight hour shift. Due to security reasons no public nor other employees are permitted in this area.

(c) The two riser stair does not serve a designated primary or secondary exit. It provides access to a convenience entrance for the office.

6. **Chief Building Officials Position**

The respondent stated that the Building Code clearing requires at least three risers for every flight of interior stairs. The stairs serving the printer room have only two risers.

7. **Commission Ruling:**

In favour of the APPLICANT. It is the decision of the Building Code Commission that the two riser stair to the printer room shows sufficiency of compliance with the Building Code provided that:

(a) Illuminating nosing is installed on each step, and

(b) A conspicuous sign stating "WATCH YOUR STEP" with an arrow and having not less than 60 mm high lettering is mounted permanently on the wall 1500 mm above the raised floor.

8. **Reasons:**

(a) The entire Data Centre has controlled access and only a few employees will have access to the printer room,

(b) Adequate warning will be provided to alert occupants to the presence of this stair.

(c) This stair is not a required means of egress.

DATE OF RULING

May 31st, 1994

RULING

1. **The Applicant**

   Mr. Peter Clewes, Wallman, Clewes, Bergman Architect Ltd. is an applicant for a permit under the Building Code Act, 1992 to construct a two storey mixed use commercial building at the northeast corner of Kennedy Road and Steeles Avenue East, Markham, Ontario.

2. **Description of Construction**

   The applicant is proposing to construct a two storey mixed use commercial building. The main floor will contain a market style retail layout and the second floor will contain restaurants. Each unit on the main floor will face a circulation aisle either 3 m or 5 m wide and at least one 2-1/2 m cross aisle, with no fire separation between units nor between units and circulation and cross aisles (i.e. similar to a department store). Each unit location has been sold as a condominium.

   The proposed building has a building area of 15,600 m2. The main and second floors will be interconnected as permitted by the Building Code.

   The entire building perimeter will face fire access routes, although the Building Code requires only 50 percent of this building perimeter to face a fire route.

   A single-stage fire alarm system will be installed. The fire alarm system will be monitored by an independent central station. The sprinkler system will be designed to function as part of the required fire detection system.

   An automatically activated smoke exhaust system will be provided for the main floor, although not required by the Building Code.

   Partitions between units will range from 2.4 to 3 m high. A security grill will be provided between units and circulation aisles permitting a view into units after business hours. The top of the unit will either be open or have an egg-crate type ceiling.

3. **Dispute**

The dispute between the Applicant and Respondent concerns sufficiency of compliance with Article 3.3.1.1. and Clause 3.3.1.4.(1)(c) the Building Code. At issue is the proposed ground floor market style retail layout with no fire separation between kunits nor between units and circulation routes where the corridor widths are 5 m or less in width.

4. **Provision of the Building Code**

Article 1.1.3.2. Definition of Suite

Suite means a single room or series of rooms of complementary use, operated under single tenancy, and includes dwelling units, individual guest rooms in motels, hotels, boarding houses, rooming houses and dormitories as well as individual stores and individual or complementary rooms for business and personal services occupancies.

Clause 3.3.1.4.(1)(c) Public Corridor Separations

(1) Except as otherwise required in this Part, public corridors shall be separated from the remainder of the building by a fire separation having a fire-resistance rating of not less than 1 hour except that (a) the fire-resistance rating need not be more than 45 min when the fire resistance rating of the floor assembly is not required to be more than 45 min, (b) no fire-resistance rating is required when the floor area is sprinklered and the corridor does not serve an institutional occupancy or a residential occupancy, (c) no fire separation is required in a sprinklered floor area where, (i) the corridor is more than 5 m in unobstructed width, and (ii) the corridor does not serve an institutional occupancy or a residential occupancy,(d) a floor assembly above a crawl space that is not considered a basement in Sentence 3.2.2.5.(2) is not required to be a fire separation, and (e) no fire separation is required in a sprinklered floor area where an occupancy in the corridor conforms to the requirements of Sentence 3.3.1.9.(6).

5. **Applicant's Position**

The applicant stated that it is reasonable to consider the proposed market style retail floor to be similar to a department store or other indoor market style layout.

The applicant said that the inherent level of safety in the building design (i.e. high ceiling and large floor area), the proposed smoke exhaust system, egress layout and evacuation time based on the results of the ASETBX simulation will provide a level of safety commensurate with that required by the Building Code.

6. **Chief Building Officials Position**

The respondent stated that each condominium unit is a suite and therefore subject to the applicable Building Code requirements.

The applicant proposes an arrangement of suites separated by aisles varying in width from 2.5 m to 5.0 m. The respondent considers these isles to be public corridors subject to Section 3.3 of the Building Code.

The respondent said that no fire separation is provided between units nor between units and the public corridor as required by the Building Code.

The respondent does not have the authority to issue a building permit for a condition that deviates from the Building Code and the use of equivalents regulated by Section 2.7 is not applicable.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that not providing fire separations between units, and units and circulation routes where the width is 5 m or less shows sufficiency of compliance provided:

i) The height of the partition walls between units does not exceed 3 m.

ii) Security closures separating units from the circulation corridors permit the interior of each unit area to be visible and will not exceed 3 m in height.

iii) Cross aisles that have been provided are maintained.

8. **Reasons:**

1. The egress layout using aisles and cross aisles exceeds the requirements of the Building Code.

2. The exit capacity has been designed to accommodate two times the occupant load permitted by the Building Code.

3. The high ceiling with the smoke exhaust system enhances the level of safety.

Dated at Toronto this 31st day in the month of May in the year 1994 for application number 1994-20.

Kenneth Bacon

PLACE

Toronto, Ontario

APPEARANCES

Mr. Franco Marino, President
Dimar Construction for applicant

DATE OF RULING

May 31st, 1994

RULING

1. **The Applicant**

   Douglas Hardie Architect Inc. is the Applicant for a permit under the Building Code Act, 1992 to construct an addition to an existing apartment building, located at 450 MacLaren Street and 334 Kent Street, Ottawa, Ontario.

2. **Description of Construction**

   The applicant is proposing to construct a two storey dwelling unit on top of an existing one storey portion of a renovated three storey apartment building. The only means of egress from the proposed dwelling unit is an exterior stair leading to ground. The stair is connected to existing decks serving other dwelling units. There are 6 unprotected openings that are exposed to the exterior stair.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Clause 9.9.9.3.(1)(a) of the Building Code. At issue is the proposed use of a second storey balcony as a second and separate means of egress for the proposed single dwelling unit addition to the existing building.

   The existing building was recently renovated into a 10 unit apartment building under the provisions of Part 11 of the Building Code. The second exit for four of these apartments is provided by using their balcony as an area of refuge. The Applicant is requesting that this principle be extended to the addition for the new proposed 2 storey dwelling unit.

4. **Provision of the Building Code**

   Sentence 9.9.9.3.(1) Shared Egress Facilities

   (1) A dwelling unit shall be provided with a second and separate means of egress where an egress door from the dwelling unit opens onto (a) an exit stairway serving more than 1 suite, (b) a public corridor serving more than one suite served by a single exit stairway, (c) an exterior passageway serving more than one suite and served by a single exit stairway, or (d) a balcony serving more than one suite and served by a single exit stairway.

5. **Applicant's Position**

   The Applicant stated that proposed dwelling unit addition is to a building with considerable heritage character which was recently renovated into an apartment building under the provisions of Part 11 of the Building Code. The renovation left the exterior virtually untouched preserving the character of the building. As part of the renovation the second exit for 4 apartments was provided by the use of their balcony as an area of refuge.

   The Applicant requested that this principle be extended to the proposed 2 storey dwelling unit addition which is designed to maintain the character of the building. The second exit from the unit would be provided by using a balcony as an area of refuge.

6. **Chief Building Officials Position**

   The respondent stated that the applicant has applied for a building permit to construct a dwelling unit addition served by a shared exterior exit stair and second floor balcony as an area of refuge.

   Sentence 2.1.1.6.(2) of the Building Code allows for the application of Part 11 provisions to additions that have been in existence less than 5 years where the building has existed for at least 5 years. If the addition qualified under this provision the egress facilities proposed for the dwelling unit would satisfy the requirements of Part 11.

   Furthermore, the respondent stated that although they were sympathetic to heritage concerns they do not have the authority to accept the proposal given that the addition is not existing and is thereby regulated by Part 9 in accordance with Article 2.1.1.3. of the Building Code.

7. **Commission Ruling:**

   In favour of the Respondent. It is the decision of the Building Code Commission that the existing arrangement for the proposed two storey dwelling addition does not show sufficiency of compliance.

8. **Reason:**

   The exterior stair is exposed by unprotected openings.

Dated at Toronto this 31st day in the month of May in the year 1994 for application number 1994-18.

PLACE Toronto, Ontario

APPEARANCES

Mr. Stephen Bernatt, President
Stephen Bernatt Architect Inc. for applicant

DATE OF RULING

May 31st, 1994

RULING

1. **The Applicant**

   The applicant, 819636 Ontario Inc. is the holder of a permit issued under s.5(1) of the Building Code Act, R.S.O. 1990, Chap. B13 to construct a residential apartment building at 132 Kingston Road West, Ajax, Ontario.

2. **Description of Construction**

   The applicant constructed a 10 storey residential apartment building containing 86 suites. The 1st, 2nd, 3rd and 4th floors of the building contain 2 storey suites, with entrances on 1st and 3rd levels. The building was designed under Article 3.2.2.38. of the Building Code and is not sprinklered.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Clause 3.3.4.2.(2)(c) the Building Code. At issue is the fire resistance rating of the corridor/suite wall of the two storey units.

   The fire separation between the public corridors and the adjacent 2 storey suites was constructed to have a 1 hour fire resistance rating. According to Clause 3.3.4.2.(2)(c), a 2 hour fire resistance rating is required for unsprinklered buildings more than 6 storeys in building height.

4. **Provision of the Building Code**

   Sentence 3.3.4.2.(2) Fire Separations

   Floor assemblies within a dwelling unit need not be constructed as fire separations provided the distance between the lowest floor level and the uppermost floor level within the dwelling unit is not more than 6 m and provided that the dwelling unit is separated from the remainder of the building by a fire separation having a fire resistance rating of not less than
   (a) 45 min where the building is sprinklered and is not more than 3 storeys in building height,
   (b) 1 h where the building is sprinklered or is not more than 6 storeys in building height, and
   (c) 2 h where the building is not sprinklered and is more than 6 storeys in building height.

5. **Applicant's Position**

A total of 9 two storey suites exist on levels 1 to 4 of the 10 storey building. The corridor/suite wall of the two storey units is constructed as a 1 h fire separation and a building permit was issued on that basis and is now occupied.

The fire separation between the 2 storey units and the corridor consists of 2 layers of 16 mm type X gypsum board on one side of 92 mm metal studs at 600 mm o.c., with one layer of 16 mm type X gypsum board on the other side. The cavity is filled with fibreglass insulation.

The Chief Building Official is now requiring a 2 h fire separation for the corridor/suite wall in question.

The Applicant feels there is no increase in hazard by having 2 storey dwelling units on floors 1 to 4 of a 10 storey building compared to having the same situation in a 6 storey building, since floors above the 4th floor are 2 h rated fire separations.

6. **Chief Building Official's Position**

A building permit and occupancy permit were issued by the Town of Ajax based on plans that showed a 1 h fire separation for the corridor/suite wall separating the two storey units on levels 1 to 4.

It was later brought to the attention of the Chief Building Official that a 2 h fire separation was required by the Building Code. An order to comply was issued under s.12(2) of the Building Code Act requiring a 2 hour fire separation between the public corridor and suite.

The Chief Building Official agrees with the Applicant's submission.

7. **Commission Ruling:**

In favour of the Applicant. It is the decision of the Building Code Commission that the 1 hour rated fire separation between the corridor and 2 storey suites on levels 1 to 4 provides sufficiency of compliance with the Building Code provisions in this particular situation.

8. **Reasons:**

i) There is no increased hazard by compartmentalizing the 2 storey units on floors 1 to 4 by a 1 h separation in a 10 storey building, provided the floors above the 4th storey are 2 h rated fire separations. ii) Building complies with all other provisions of the Ontario Building Code.

RULING

1. **The Applicant**

   The Applicant, Mr. Anthony Gubbels is the holder of a permit issued under s.8(1) of the Building Code Act, 1992 to construct a single family dwelling at 300 Dufferin Avenue, London, Ontario.

2. **Description of Construction**

   The applicant is proposing to construct a single family house with a basement foundation.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns sufficiency of compliance with Clause 9.14.2.1.(2.1)(c) of the Building Code. Also at issue is the proposed use of a System Platon membrane as both dampproofing in accordance with Section 9.13 and as a drainage layer in accordance with Section 9.14.

4. **Provision of the Building Code**

   Sentence 9.14.2.1.(2.1) Foundation Wall Drainage (2.1) The drainage layer required in Sentence (2) shall be provided by (a) not less than 19 mm mineral fibre insulation with a density of not less than 57 kg/m3; (b) not less than 100 mm of free drainage granular material; or, (c) a system which can be shown to provide equivalent performance to that provided by the materials described in Clauses (a) or (b).

5. **Applicant's Position**

   The applicant stated that System Platon has been well and properly presented, evaluated and in fact accepted as meeting Clause 9.14.2.1.(2.1)(c) and other Building Code provisions intended to keep basements dry. Reference was made to the following evaluations: (a) CCMC 12266-R of 26 July 1991; (b) BMEC 91-6-154 of 13 November 1991; and, (c) Housing Development and Buildings Branch Opinion of 11 February 1994.

6. **Chief Building Officials Position**

The respondent stated that there was insufficient information to determine if the product provided equivalent performance to the materials specified in Clause 9.14.2.1.(2.1)(a)&(b). The respondent said that he could not determine whether the Building Materials Evaluation Commission authorization (No. 91-6-154) of the Platon System as a dampproofing membrane applied when the product is used as a drainage layer.

7. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that the use of System Platon shows sufficiency of compliance with the Building Code as a dampproofing and drainage layer system.

8. **Reason:**

   Based on the information provided, System Platon has been determined to provide equivalent performance to materials specified in Clause 9.14.2.1.(2.1)(a) and (b).

APPEARANCES

Ms. Cynthia Zahoruk
Lorne Haverty Ltd. Architect for applicant

Mr. Robert Milligan, Supervisor of Inspections
and Mr. Collin Potter, Plans Examiner, City of Stoney Creek for respondent

DATE OF RULING

May 24th, 1994

RULING

1. **The Applicant**

   The Applicant, Stoney Creek Non-Profit Housing Corporation is the holder of a permit under s.5(1) of the *Building Code Act, R.S.O. 1990*, Chap. B13 to construct a residential apartment building at 971 Queenston Road, Stoney Creek, Ontario.

2. **Description of Construction**

   A building permit was issued on November 2, 1992 to constructed a 7 storey noncombustible residential apartment building containing 93 suites. The building was designed under Article 3.2.2.38. of the Building Code and is not sprinklered.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns the interpretation of Sentence 3.1.5.11.(5) of the Building Code. The portion of the building that is subject to the dispute is a sloping roof top enclosure which contains a mechanical room and a sheltered attic space which contains anchors for the window cleaning system.

   At issue is the 4 inch thick foamed plastic insulation having a flame spread rating of 100 applied to the floor of this enclosure, excluding the floor of the mechanical room, to insulate the ceiling of the heated space below the floor.

   An order to comply was issued on January 13, 1994 requiring the removal of the foamed plastic insulation.

4. **Provision of the Building Code**

   Sentence 3.1.5.11.(5) Combustible Insulation and its Protection (5) Combustible insulation, including foamed plastics, installed above roof decks, outside of foundation walls below ground level and beneath concrete slabs-on-ground is permitted to be used in a building required to be of noncombustible construction.

5. **Applicant's Position**

   The applicant stated that the combustible insulation should be allowed to remain in place without the protection outlined in any other part of Article 3.1.5.11. since Sentence 3.1.5.11.(5) allows combustible insulation above the roof deck.

6. **Chief Building Officials Position**

   The respondent stated that Sentence 3.1.5.11.(5) of the Building Code is only intended to apply to a flat roof surface which is exposed to the elements. In this building, the attic or roof space includes an enclosed mechanical room. Anyone attempting access to exit could be exposed to excessive smoke development if a fire occurred in the mechanical room area. The appropriate Building Code references are Sentence 3.1.5.11.(2) and 3.1.13.8.(1)(b).

7. **Commission Ruling:**

   In favour of the Respondent. It is the decision of the Building Code Commission that the present construction does not comply with the Building Code.

8. **Reasons:**

   1. The surface on which the foam plastic is resting on should be considered a floor assembly, since the space in question is enclosed and provides access to the mechanical room. The sloping metal deck should be considered the roof assembly.

   2. The present code does not address the use of combustible insulation having a flame spread rating greater than 25, but not more than 500 on the top of a floor of an assembly. It is our opinion that the use of foam plastic having a flame spread rating of 100 on the top of a floor assembly protected in accordance with 3.1.5.11.(3) provides a comparable level of risk as when the foam plastic is used on an exterior wall.

Dated at Toronto this 24th day in the month of May in the year 1994 for application number 1994-10.

Ms. Brenda Campbell, Supervisor of Plans and
Permits, City of Brampton for respondent

Mr. Danny Hui, Building Code Advisor,
Ministry of Housing.

DATE OF RULING

April 25th, 1994

RULING

1. **The Applicant**

   The Applicant, Mr. Claudio Cavalieri, Internorth Construction Company Limited is the holder of a permit issued under the *Building Code Act, 1992* to construct a building at 107 Walker Road, Brampton, Ontario.

2. **Description of Construction**

   A building permit was issued on November 18, 1993 to construct a cold-storage warehouse and office building at 107 Walker Drive, Brampton, Ontario. The building is classified as Group F Division 2 and is designed according to Article 3.2.2.53 of the Building Code. The building is required to be noncombustible construction.

   1. **Dispute**

      The dispute between the Applicant and Respondent concerns sufficiency of compliance with Sentence 3.1.5.11.(6) of the Building Code. The applicant used Zer-O-Loc Panels on the exterior walls of the building. These factory assembled exterior wall panels use expanded polystyrene insulation material rather than thermosetting plastic material required by Sentence 3.1.5.11.(6) of the Building Code.

2. **Provision of the Building Code**

Sentence 3.1.5.11.(6) Thermosetting Foamed Plastic Insulation (6) Thermosetting foamed plastic insulation having a flame-spread rating of not more than 500 which forms part of a factory-assembled exterior wall panel that does not incorporate an air space is permitted to be used in a building required to be of noncombustible construction provided:

(a) the foamed plastic is protected on both sides by sheet steel not less than 0.38 mm thick which will remain in place for not less than 10 minutes when the wall panel is tested in conformance with CAN4-S101-M, Standard Methods of Fire Endurance Tests of Building Construction and Materials,

(b) the flame spread rating of the wall panel, determined by subjecting a sample including an assembled joint to the appropriate test described in Subsection 3.1.12., is not more than the flame-spread rating permitted for the room or space which it bounds,

(c) the building does not contain a Group B or Group C major occupancy, and

(d) the building is not more than 18 m high, measured between grade and the floor of the uppermost storey.

3. **Applicant's Position**

The applicant stated that the use of Zer-O-Loc panel system complies with Sentence 3.1.5.11.(6) of the Building Code except that the insulation is not thermosetting. The applicant provided information indicating that expanded polystyrene foamed plastics used as the core of an exterior wall panel system in a fully sprinklered building does not create a greater fire hazard than a thermosetting foamed plastic wall panel system.

4. **Chief Building Officials Position**

The respondent stated that the use of Zer-0-Loc panels does not meet all the conditions in Sentence 3.1.5.11.(6) of the Building Code. In order to accept the installation of the Zer-O-Loc panels under Section 9 of the Building Code Act and Section 2.7 of the Building Code the Chief Building Official must be satisfied that it will provide the level of performance that would be achieved by conformance with the requirements of the building code. The respondent stated that the information submitted did not provide assurance of this.

5. **Commission Ruling:**

   In favour of the Applicant. It is the decision of the Building Code Commission that the use of expanded polystyrene insulation material which forms part of a factory-assembled exterior wall panel that does not incorporate an air space is acceptable in a building required to be of noncombustible construction.

6. **Reasons:**

   1. The building will be fully sprinklered so that any fire involving the melted polystyrene will be controlled. 2. The panels conform to Clauses (a),(b),(c) and (d) of Sentence 3.1.5.11.(6) of the Ontario Building Code. 3. The expanded polystyrene has a flamespread rating of less than 150.

B>DATE OF RULING

April 25th, 1994

RULING

1. The Applicant

The Applicant, Mr. Ian Farley, Royal City Tennis Club Corporation has applied for a permit under the Building Code Act, 1992 to construct a building at 70 Municipal Street, Guelph, Ontario.

2. Description of Construction

The applicant is proposing to construct a year round tennis facility comprising a clubhouse facility attached to an air- supported structure covering six tennis courts.

3. Dispute

The dispute between the Applicant and Respondent concerns sufficiency of compliance with Sentence 3.1.6.3.(2) of the Building Code. At issue is the separation between the clubhouse and the air-supported structure. Sentence 3.1.6.3.(2) of the Building Code does not permit the air-supported structure to be erected closer than 3 metres to the clubhouse. In addition, the buildings must be sufficiently distance from one another to provide an area to be used as a means of emergency egress.

4. Provision of the Building Code

Sentence 3.1.6.3.(2) Clearance to Other Structures

(2) Tents and air-supported structures shall not be erected closer than 3 metres to other structures on the same property except as provided in Sentence (3) and (4), and shall be sufficiently distant from one another to provide an area to be used as a means of emergency egress.

5. Applicant's Position

The proposed construction of the clubhouse facility and attached air-supported structure does not appear to comply with the requirements of Article 3.1.6.3.(2) of the Building Code. The following compensating safety features are proposed in lieu of the required 3 metre distance separation:

i. The clubhouse will be fully sprinklered in accordance with NFPA-13 and be non-combustible construction.
ii. Window sprinklers authorized by the Building Materials Evaluation Commission (BMEC) shall be installed on all perimeter windows of the clubhouse which are adjacent to the air-supported structure.
iii. An audible warning device shall be installed to warn occupants of a collapse of the air-supported structure.
iv. The air-supported structure and clubhouse will conform to the Building Code in all other aspects.
v. Occupancy for the air-supported structure and clubhouse shall be limited to only tennis functions. The occupant load shall be as follows:

Air-supported Structure

Total Maximum occupant load 48
Normal average occupant load 18

Clubhouse

Total Maximum occupant load 80
Normal average occupant load 18

The following reasons were given by the applicant in support of their request for approval:

i. The structure does not create a hazard to the public due to the following:
    a. Non-combustible construction of the clubhouse;
    b. Fully sprinklered clubhouse; and,

c. Air-supported structure and clubhouse have low fire load, low occupancy load, portable fire extinguishers as per code, exits as per code, and fire access and hydrant as per code.

ii. The Building Code Commission has ruled in favour of the applicant, with respect to the same issue, on at least two other occasions.

iii. The City of Guelph Building Department does not oppose this application.

6. Chief Building Officials Position

The respondent stated that Sentence 3.1.6.3.(2) of the Building Code specifically prohibits any structure to be located within 3 metres of an air-supported structure. The respondent said the building department was aware that there have been several previous rulings on a similar issue, but it was their understanding that previous Building Code Commission rulings are site specific. Also their interpretation of Section 2.7 of the Building Code did not provide authority to accept this system as an equivalent.

7. Commission Ruling:

In favour of the Applicant. It is the decision of the Building Code Commission that having no spatial separation between the clubhouse and the air-supported structure shows sufficiency of compliance.

8. Reason:

The clubhouse will be separated from the air-supported structure by a fire separation and all openings will be protected. In this manner fire containment will be achieved.

Dated at Toronto this 25th day in the month of April in the year 1994 for application number 1994-09.

BCC Ruling No. 94-07-385

BUILDING CODE COMMISSION DECISION ON B.C.C. #94-07-385

IN THE MATTER OF Subsection 24(1) of the Building Code Act, 1992.

AND IN THE MATTER OF Article 9.10.14.1. of the O. Reg. 419/86, as amended by O.Reg. 183/88, 581/88, 114/89 and 115/89 (the "Building Code").

AND IN THE MATTER OF an application by Mr. Dominic Di Paola for the resolution of a dispute with Mr. Michael Nixon, Chief Building Official, City of Toronto.

APPLICANT

- Mr. Dominic Di Paola

RESPONDENT

- Mr. Michael Nixon
  Chief Building Official
  City of Toronto

PANEL

- Sarah Maman, Chair
- Michael Lio
- David Lam

PLACE Toronto, Ontario

APPEARANCES

- Mr. Edward Ofosu-Barko, Building Engineer,
  City of Toronto, for Respondent

DATE OF RULING May 24th, 1994

RULING

1. The Applicant

The Applicant, Mr. Dominic Di Paola, is the holder of a permit issued under s.5(1) of the Building Code Act, R.S.O. 1980, Chap. 51 to construct an addition to a single family house at 303 Evelyn Avenue, Toronto, Ontario.

2. Description of Construction

The applicant constructed a two storey addition to a single family house. The limiting distance of the north exposing building face is 1.2 metres from the property line.

3. Dispute

The dispute between the Applicant and Respondent concerns the interpretation of Article 9.10.14.1. of the Building Code. At issue is the percentage of unprotected openings in the north exposing building face of the addition. Table 9.10.14.A. identifies the maximum percentage of unprotected openings in an exposing building face with a limiting distance of 1.2 metres to be 7 percent.

The drawings that formed the basis of permit issuance did not indicate any openings on the north elevation of the addition. An order to comply was issued on June 15, 1993 by the City of Toronto requiring compliance with the drawings.

4. Provision of the Building Code

Article 9.10.14.1., Maximum Percentage of Unprotected Openings

Except as provided in Articles 9.10.14.2. to 9.10.14.7., the maximum percentage of unprotected openings in an exposing building face shall conform to Table 9.10.14.A. or to Subsection 3.2.3., which is the least restrictive for the occupancy being considered. The area of an exposing building face shall be calculated as the total area of exterior wall facing in 1 direction on any side of a building measured from the finished ground to the uppermost ceiling, except that where a building is divided by fire separations into fire compartments, the area of exposing building face may be calculated for each fire compartment provided such separations have not less than a 2 h fire-resistance rating in the case of mercantile and medium hazard industrial occupancies and 3/4 h for other occupancies.

5. Applicant's Position

The applicant wishes to provide more than 7 percent unprotected openings on the north exposing building face. No supporting documentation or design justification for exceeding the 7 percent criteria was submitted for consideration.

6. Chief Building Officials Position

The plans accompanying the application for a building permit indicated no openings on the north elevation of the addition. The building permit was issued on July 31, 1990.

The respondent stated that the percentage of unprotected openings on the north elevation does not comply with Building Code requirements. The applicant was advised of solutions to reduce the area of unprotected openings.

7. Commission Ruling:

In favour of the Respondent. It is the decision of the Building Code Commission that the amount of unprotected openings on the north elevation does not comply with the Building Code.

8. Reason:

The Applicant has not proposed any alternative method to permit the amount of unprotected opening on the north elevation to exceed 7%, as calculated using Table 9.10.14.A.

Dated at Toronto this 24th day in the month of May in the year 1994 for application number 1994-06.

BCC Ruling No. 94-06-384

BUILDING CODE COMMISSION DECISION ON B.C.C. #94-06-384

IN THE MATTER OF Subsection 24(1) of the Building Code Act, 1992.

AND IN THE MATTER OF Articles 9.9.2.7. and 3.7.1.2. of Ontario Regulation 413/90 as amended by O.Regs. 400/91, 159/93 and 160/93 (the "Building Code").

PLACE Toronto, Ontario

APPEARANCES

- Mr. Gordon Mason, President
  Masfal Construction Limited for applicant

- Mr. Jeff Chalmers, Chief Building Official
  and Mr. Robert Waldron, Building Inspector,
  City of Peterborough for respondent

DATE OF RULING March 29th, 1994

RULING

1. The Applicant

The Applicant, Mr. Gordon Mason, is the holder of a permit issued under the Building Code Act, 1992 to renovate a building at 166 Brock Street and 441 George Street North, Peterborough, Ontario.

2. Description of Construction

The Applicant extensively renovated the interior of two existing 100 year old two storey buildings located at 166 Brock Street and 441 George Street North. The first storey of each building was used as a mercantile occupancy and the second storey for apartments. There was no proposed change of occupancy. The proposed construction falls under Part 9 of the Building Code.

3. Dispute

The dispute between the Applicant and Respondent concerns an interpretation of Section 3.7 Barrier-Free Design of the Building Code. During the process of extensively renovating the interior of the buildings the Applicant reconstructed the store fronts in one building and replaced the doors in the second and did not provide barrier free access to some units on the first storey.

4. Provision of the Building Code

Article 9.9.2.7. Barrier-Free Path of Travel

"(1) Except as provided in Sentence (3), every building shall be designed to provide for a barrier-free path of travel in conformance with Section 3.7.
(2) Where the barrier-free path of travel required in Sentence (1) is provided to any storey above the first storey, the requirements in Article 3.3.1.7. shall apply.

(3) The barrier-free path of travel described in Sentence (1) need not be provided for houses including semi-detached houses, duplexes, triplexes, town houses, row houses and boarding, or rooming houses with fewer than 8 boarders or roomers."

Article 3.7.1.2. Entrances

"(1) Except as required in Sentence (2), every building in Article 3.7.1.1. shall have at least one entrance intended for general use by the public or the occupants designed in conformance with Article 3.7.3.3. and opening to the outdoors at sidewalk level or to a ramp conforming to Article 3.7.3.4. leading to a sidewalk.
(2) Where a suite of Group A, D or E occupancy is contained on the first storey of a building or on a storey to which a barrier-free path of travel is provided, and is completely separated from the remainder of the building so that there is no access to the remainder of the building, such suite shall have at least one barrier-free entrance in conformance with Sentence (1)."

5. Applicant's Position

The applicant did not provide barrier free access in accordance with Section 3.7 of the Building Code for the following reasons:

1. The stores did not have barrier free access prior to the renovation;
2. The floors in the units where barrier free access was not provided were left in place as originally constructed and are not level with the sidewalk; and,
3. The existing store fronts are directly against the sidewalk and offer no opportunity to facilitate barrier free access.

6. Chief Building Officials Position

The respondent stated that the existing exterior door\frame assembly and porch were removed and reconstructed at the rear entrance to 166 Brock Street. This was part of the major "gut renovation" project which required vacant possession of the building. The accessibility of this entrance was further reduced as a result of lowering the lot grade.

At 441 George Street North, the store fronts were completely reconstructed as part of another "gut renovation" project. The respondent stated that the door sill heights at entrances could have been coordinated with the City sidewalk reconstruction.

7. Commission Ruling:

In favour of the Applicant. It is the decision of the Building Code Commission that the units on the first storey of 166 Brock Street and 441 George Street North that have not been provided with barrier free access complies with the Building Code.

8. Reasons:

1. In the case of 166 Brock Street only the doors were replaced, but the size of the openings and the door frames did not change. There was always an elevation difference between the finished ground and the floor level. As a result there was no substantial change to the exterior to require barrier free access.
2. In the case of 441 George Street North, in order to provide barrier free access to the two mercantile units in question, not only would the store fronts need to be renovated, but the floor would have to be lowered; however, lowering of the floor was not part of the proposed construction.

Dated at Toronto this 29th day in the month of March in the year 1994 for application number 1994-05.

APPEARANCES

Mr. Robert Ritz, Principal, R. Ritz Architect for applicant

Mr. Fred Pellow, Building Inspector, Town of Goderich for respondent

DATE OF RULING

March 29th, 1994

RULING

1. **The Applicant**

   The Applicant, Mr. Robert Sherwood, is the holder of a permit issued under the Building Code Act, 1992 to construct a building at 52 East Street, Goderich, Ontario.

2. **Description of Construction**

   The Applicant constructed a two storey building intended for first storey business and personal service occupancy and second storey residential occupancy. Both exterior side walls of the building have a limiting distance of zero. The drawings that formed the basis of permit issuance indicated that the exterior side walls would be constructed of concrete block with steel furring and steel cladding. This was later changed to wood studs and vinyl cladding without prior notification or approval of the Chief Building Official.

3. **Dispute**

   The dispute between the Applicant and Respondent concerns an interpretation of the technical requirements of the Building Code. The Applicant proposed to move the location of both side property lines to the centre line of the exterior concrete block walls by means of a legal agreement, easement or severance, thereby eliminating the need for noncombustible cladding on the firewall.

4. **Provision of the Building Code**

   Article 9.10.14.11. Construction of Exposing Building Face

   "Except as permitted in Articles 9.10.14.12. to 9.10.14.16., each exposing building face and any exterior wall located above an exposing building face that encloses an attic or roof space shall be constructed in conformance with Table 9.10.14.B. and Subsection 9.10.8."

5. **Applicant's Position**

The applicant submits that a Party Wall/Firewall constructed on a property line with deeded joint use by both property owners can have combustible cladding on its exterior face.

6. **Chief Building Officials Position**

The respondent submits that the proposal to move the property lines to the centre of the concrete block exterior walls and not remove the combustible cladding does not comply with Article 9.10.14.11. Also, the Chief Building Official did not authorize a change to the drawings that formed the basis on which the permit was issued (BCA ss.8(12)).

7. **Commission Ruling**

In favour of the Respondent. It is the decision of the Building Code Commission that the construction requirements of the exposing building face of a firewall erected at or upon a line separating 2 parcels of land at 52 East Street, Goderich, Ontario does not comply with Article 9.10.14.11.

8. **Reason**

The exposing building face contains combustible cladding.

Dated at Toronto this 29th day in the month of March in the year 1994 for application number 1994-07.

BCC Ruling No. 94-04-382

BUILDING CODE COMMISSION DECISION ON B.C.C. #94-04-382

IN THE MATTER OF BUT NOT LIMITED TO:

Ontario Building Code, O. Reg. 413/90

PART 3,

Sentence 3.3.1.9.(8)

Requirement for a dead end corridor serving an assembly occupancy.

COMMISSION RULING:

In favour of the APPLICANT.

Regarding the question concerning the dead end portion of a second storey public corridor, approximately 4.5 m long, providing access to exit from a proposed private school classroom served by only one egress door, located at 7077 Kennedy Road, Suite 208, Markham, Ontario.

It is the decision of the Building Code Commission that providing smoke detectors in the public corridor connected to the fire alarm annunciator panel provides sufficiency of compliance.

REASONS:

1. The building is provided with a supervised sprinkler system.
2. The smoke detectors will provide early warning of any fire condition in the public corridor.
3. The occupant load will be limited to 19 people including 4 supervisory staff and the maximum occupant load will be posted.
4. The travel distance from the suite door to the exit is not more than 3 metres.

Dated at Toronto this 22nd day in the month of February in the year 1994 for application number 1994-04.

BCC Ruling No. 94-03-381

BUILDING CODE COMMISSION DECISION ON B.C.C. #94-03-381

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, as amended

PART 3,

Clause 3.2.4.8.(1)(h) and Article 3.2.4.16.

Requirements for annunciator zone indication when sprinklers are used in lieu of heat detectors.

COMMISSION RULING:

In favour of the APPLICANT.

Regarding the question concerning annunciator zone indication of sprinklers being used in lieu of heat detectors at Residence St. Louis, 879 Hiawatha Park Road, Gloucester, a 4 storey nursing home having an approximate building area of 4500 metres squared.

It is the decision of the Building Code Commission that the provision of 2 sprinkler zones per floor shows sufficiency of compliance.

REASONS:

1. The smoke detectors in the patient occupied areas are part of an addressable fire alarm system so that prompt identification of the exact fire location has been provided.
2. There are two fully staffed nursing stations on each floor level where patient occupied areas are located.

Dated at Toronto this 22nd day in the month of February in the year 1994 for application number 1994-03.

BCC Ruling No. 94-02-380

BUILDING CODE COMMISSION DECISION ON B.C.C. #94-02-380

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O. Reg, 413/90

PART 3,

Clause 3.2.9.1.(1)

Requirement for standpipe and hose systems.

COMMISSION RULING:

In favour of the APPLICANT.

Regarding the question of whether a standpipe and hose system is required throughout the proposed Bata Shoe Museum located at 327 Bloor Street West in Toronto, being a building three storeys in height with two basement levels, or only in its two basement levels.

It is the decision of the Building Code Commission that a standpipe and hose system is only required on the two basement levels.

REASON:

Sentence 3.2.9.1.(1) of the Ontario Building Code, O. Reg. 413/90 clearly indicates that the standpipe and hose system is only required on the two basement levels.

Dated at Toronto this 22nd day in the month of February in the year 1994 for application number 1994-02.

BCC Ruling No. 94-01-379

BUILDING CODE COMMISSION DECISION ON B.C.C. #94-01-379

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 419/86 as amended

PART 3,

Clauses 3.2.2.26.(2)(b)

Requirement for the fire resistance rating of mezzanines.

COMMISSION RULING:

In favour of the Applicant.

Regarding the fire resistance rating of two mezzanines in a sprinklered mechanical penthouse of the Timmins District Hospital, 700 Ross Avenue East, Timmins, Ontario.

It is the decision of the Building Code Commission that this matter of two poured concrete on metal pan platforms supported by steel supports located in the mechanical penthouse of a sprinklered hospital and used to store or access mechanical and electrical equipment shows sufficiency of compliance.

REASONS:

1. These platforms are intended solely for periodic service and maintenance of equipment; and,
2. The exposed steel supports are protected by an electrically supervised sprinkler system to the local fire department.

Dated at Toronto this 19th day in the month of January in the year 1994 for application number 1994-01.

BCC Ruling No. 93-22-378

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-22-378

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90, as amended

PART 9,

Article 9.29.2.1.

Requirement for waterproof wall finish.

COMMISSION RULING:

In favour of the Respondent.

Regarding the minimum height of waterproof finish required above the rim of a whirlpool tub on a vertical wall 6 inches from the rim, at 61 Raymar Place, Oakville, Ontario.

It is the decision of the Building Code Commission that providing only waterproofing material 4 inches above the whirlpool tub on the vertical wall does not comply with the Ontario Building Code.

REASON:

The existing waterproofing material along the vertical and horizontal does not provide sufficient waterproofing protection.

Dated at Toronto this 20 day in the month of December in the year 1993 for application number A93-24-380.

BCC Ruling No. 93-21-377

BUILDING CODE COMMISSION DECISION ONB.C.C.#93-21-377

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90, as amended

PART 3,

Sentence 3.1.11.2.(1)

Requirements for fire stopping in wall assemblies.

COMMISSION RULING:

In favour of the Applicant.

Regarding the fire stopping in wall assemblies where the insulation within the wall space has a flame-spread rating greater than 25 at Providence Tower, 7900 McLaughlin Road South, Part of East Half of Lot 15, Concession 2, West of Hurontario Street, Brampton, Ontario.

It is the decision of the Building Code Commission that insulation in excess of a 25 flame spread rating within the wall space of a non-combustible building with no fire stopping, provided that there is only one concealed air space that is no more than 25 mm thick, shows sufficiency of compliance with the Ontario Building Code.

REASONS:

1. Test data indicates that the thickness of the air space in the wall cavity is the critical factor to predicting the spread of fire vertically.
2. The foam plastic insulation will be sandwiched between 2 layers of masonry.
3. The National Building Code have permitted this proposal in an interim Code change.

Dated at Toronto this 20 day in the month of December in the year 1993 for application number A93-23-379.

BCC Ruling No. 93-20-376

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-20-376

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90, as amended

PART 9,

Article 9.10.14.1. and Sentence 9.10.14.12.(4).

Maximum percentage of unprotected openings where the spatial separation between dwelling units on adjoining properties is registered on the titles of both properties.

COMMISSION RULING:

In favour of the applicant.

Regarding the registration of a line 2.4 metres south of the property line into a service easement for a length of 17.8 metres on the title of abutting properties to permit an increase in the maximum permitted area of unprotected openings for a Business and Personal Service Occupancy, being Unit 14, Centrepointe Chambers, Block 5, Registered Plan 4M-825, City of Nepean, Regional Municipality of Ottawa Carleton, Ontario.

It is the decision of the Building Code Commission that this matter of increasing the maximum area of unprotected openings by registering a line 2.4 metres south into a service easement for a length of 17.8 metres meets the intent of the Ontario Building Code.

REASONS:

1. This new limiting distance line will be registered on the titles of both properties.
2. The Ontario Building Code already permits this for residential occupancies and there is no reason this principle could not be extended to a Group D Business Occupancy.

Dated at Toronto this 20 day in the month of December in the year 1993 for application number A93-22-378.

BCC Ruling No. 93-19-375

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-19-375

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90, as amended

PART 3,

Clause 3.4.2.3.(1)(a)

Minimum distance between two required exits on a floor area.

COMMISSION RULING:

In favour of the respondent.

Regarding a double swing door in a public corridor separating two exits located at 142-144 Clarence Street, Ottawa, Ontario.

It is the decision of the Building Code Commission that this matter of the deletion of the double swing door in the public corridor does not comply with Sentence 3.4.2.3.(1) of the Ontario Building Code.

REASONS:

The low occupant load is not a consideration in this matter.

Dated at Toronto this 20 day in the month of December in the year 1993 for application number A93-21-377.

BCC Ruling No. 93-18-374

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-18-374

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PART,

Sentence 6.2.3.11.(2)

Prohibiting the circulation of air from one suite to any other suite or to a public corridor or public stairway in a residential occupancy.

COMMISSION RULING:

In favour of the applicant.

Regarding the H.V.A.C. design for the bedrooms on the second and third storey of Covenant House, 20 Gerrard Street East, Toronto

It is the decision of the Building Code Commission that this matter of the recirculating H.V.A.C. system for the bedrooms on the second and third storeys of Covenant House, a support centre for street youth; shows sufficiency of compliance.

CONDITION:

The return air plenum must be separated from the corridor by at least a 3/4 h. fire separation.

REASONS:

1. The building is fully sprinklered and the alarms will be supervised to a central station.
2. The building will be under the strict supervision of Covenant staff, 24 hours per day, who will have unrestricted access to all bedrooms.
3. Duct-type smoke detectors will be provided that will automatically shut off the H.V.A.C. system in the event the fire alarm system is activated.
4. None of the bedrooms have kitchen or washroom facilities.

Dated at Toronto this 01 day in the month of November in the year 1993 for application number A93-20-376.

BCC Ruling No. 93-17-373

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-17-373

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PART,

Clause 9.14.2.1.(2.1)(c) and 9.25.4.9.(2)(c) Foundation Drainage Layer and Insulation of Foundation Walls

COMMISSION RULING:

In favour of the applicant.

Regarding the foundation drainage layer and insulation of foundation walls of a single family residence located on Lot #26, Winder Woods, London, Ontario.

It is the decision of the Building Code Commission that this matter of the use of Styrofoam * PERIMATE * an exterior basement insulation drainage product manufactured by Dow Chemical used to comply with the foundation drainage layer and insulation of foundation wall requirements shows equivalency of performance as outlined in Clauses 9.14.2.1.(2.1)(c) and 9.25.4.9.(2)(c).

REASONS:

1. A series of small scale tests were conducted to compare the drainage performance of mineral fibre insulation and Styrofoam * PERIMATE *. The results indicated that Styrofoam * PERIMATE * provided equivalent drainage performance.
2. Full scale soak tests were conducted on two full height basements insulated with Styrofoam * PERIMATE *. The basements did not leak after a 48 hour soaker hose test.
3. Thermal resistance tests were conducted on Styrofoam * PERIMATE * in accordance with ASTM C-518-85 and C-177-85 to determine the typical R-value. The R-value of 2.5 inch thick Styrofoam * PERIMATE * was found to be greater than 12 which complies with Table 9.25.2.A. of the Ontario Building Code.
4. If this product will be used as a composite insulation system an insulation overlap of at least 2 times the foundation wall thickness will be provided.

Dated at Toronto this 01 day in the month of November in the year 1993 for application number A93-19-375.

BCC Ruling No. 93-16-372

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-16-372

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PART,

Sentence 3.1.6.2.(3) Air-Supported Structures

COMMISSION RULING:

In favour of the applicant.

Regarding an air-supported structure for a golf driving range, 150 Burncrest Road, Markham, Ontario.

It is the decision of the Building Code Commission that this matter of an air-supported golf driving range containing a non- combustible mezzanine occupying under 5% of the floor area shows sufficiency of compliance if the features in the "Reasons" are provided.

REASONS:

1. The mezzanine will be used as a golf driving range and will allow an open view of the floor area below.
2. A continuous horizontal structural member will be installed not less than 4.5 m above the length of the platform walkway to support the roof fabric in case of collapse.
3. The maximum travel distance from any point on the platform to an exit is 30 m.
4. An audible warning device will warn occupants of a collapse of the fabric.

Dated at Toronto this 01 day in the month of November in the year 1993 for application number A93-16-372.

BCC Ruling No. 93-15-371

Sentence 3.2.8.2.(6) and Clause 3.3.1.4.(1)(c)

Second floor public corridor open to adjacent ground floor space.

COMMISSION RULING:

In favour of the Applicant.

Regarding Building A, 1550 South Gateway Road, Mississauga, Ontario.

It is the decision of the Building Code Commission that this matter of the 2nd floor corridor design which is a minimum of 2 metres in width, open to a two level interconnected floor space and separated from the tenant areas by a non-rated fire separation has sufficiency of compliance.

REASONS:

1. The tenant areas on the second level are separated from the public corridor by a non-rated fire separation.
2. The travel distance from any point in the public corridor to the exit stair is 45 metres.
3. The building is protected by a central station supervised sprinkler system.
4. The present corridor arrangement provides sufficient exiting capacity.

BCC Ruling No. 93-14-370

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-14-370

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PART,

3.2.7.9. Emergency power for building services, water supply for fire fighting.

COMMISSION RULING:

In favour of the respondent.

Regarding Westwood Court Apartment Building, 246 Westwood Road, Guelph, Ontario.

It is the decision of the Building Code Commission that this matter of a newly constructed 4 storey apartment building with standpipe and booster pump shall require an emergency generator for the booster pump capable of providing the required load for a minimum of 30 minutes.

REASONS:

Since hose cabinets have been provided in this building, there is a reasonable expectation on the part of any user of the firehose lines that the required pressure be available. Since the required pressure can only be provided by the booster pump powered by the building's electrical supply which could be interrupted by a fire condition, the booster pump must be connected to an emergency generator.

Dated at Toronto this 21 day in the month of October in the year 1993 for application number 93-14-370.

BCC Ruling No. 93-10-366

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-10-366

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PARTS, Sentence 3.2.2.22.(4)

COMMISSION RULING:

In favour of the Applicant.

Regarding St. James High School, 57 Victoria Road North, Guelph.

It is the decision of the Building Code Commission that there is sufficiency of compliance provided that the proposed horizontal extension of 1 hour fire protection to the roof structure from the south wall of the mezzanine and extended for a total of 13.650 m and that the fire protection be returned up to the underside of the roof deck at the north edge of the protection.

REASONS:

The requirement of a 6 m spatial seperation above the main floor as per the Code is met only beyond the north edge of the main floor bleachers.

DATED at Toronto this 10th day in the month of August in the year 1993 for application # 93-10-366 on behalf of the BUILDING CODE COMMISSION:

BCC Ruling No. 93-9-365

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-9-365

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

SENTENCE, 3.4.4.4.(7)

COMMISSION RULING:

In favour of the Respondent.

Regarding 301 Fruitland Road, Stoney Creek, Ontario.

It is the decision of the Building Code Commission that the door from the Bell Canada equipment room shall not open directly into the exit.

REASONS:

1. The Bell Canada equipment room is deemed to be a service room.
2. The existing security system and the proposed additional security system does not provide sufficiency of compliance.

BCC Ruling No. 93-8-364

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-8-364

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

SENTENCE, 3.7.2.3.(1)

COMMISSION RULING:

In favour of the Applicant.

Regarding Suite 505, 6299 Airport Road, Mississauga, Ontario.

It is the decision of the Building Code Commission that there is no need for a barrier free washroom in this suite.

REASONS:

1. This existing building was built prior to the introduction of barrier-free design requirements in the Ontario Building Code
2. None of the entrances to this building comply with the barrier-free entrance design requirements of Section 3.7. of the current Code.

BCC Ruling No. 93-7-363

BUILDING CODE COMMISSION DECISION ON B.C.C. #93--7-363

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PART,

3.2.5.13.(1) Sprinkler Protection in High Pile Storage of Flammable Liquids

COMMISSION RULING:

In favour of the Applicant.

Regarding Flammable Goods Warehouse, BASF Canada Inc., 10 Craig Street, Brantford, Ontario.

It is the decision of the Building Code Commission that this single storey 27,279 sq. ft. flammable liquids warehouse protected by an AFFF sprinkler system with storage up to 28 ft. shows sufficiency of compliance.

REASONS:

1. The ceiling sprinkler density is double that required for rack storage of flammable liquids stored to a height of 25 ft. as per NFPA 30.
2. The travel distance to an exist is 75 ft.
3. There is a watchman on duty 24 hours a day at the guardhouse who makes hourly rounds.
4. The sprinkler system is supervised to the fire department and the guardhouse.
5. The plant operates 24 hours a day.
6. The warehouse is divided into two sections by a parapetted 4 hr. fire separation with 3 hr. fire protection rated closures on all openings.
7. The paid full-time fire department have the expertise to fight a fire at the warehouse and are equipped with AFFF.

BCC Ruling No. 93-6-362

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-6-362

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PART,

3.1.2.1. Classification of Buildings.

COMMISSION RULING:

In favour of the Respondent.

Regarding Furniture Gallery, 175 Dieppe Road, St. Catharines, Ontario.

It is the decision of the Building Code Commission that the occupancy classification for the new 3841 sq. ft. addition to a 16,365 sq. ft. existing building be an "E" mercantile occupancy.

REASONS:

1. It is the intent of the Code that Group "E" mercantile occupancies be buildings and/or parts of buildings where the public can enter to view and/or purchase goods while Group "F-3" storage occupancies be buildings or parts of buildings where the general public is not permitted to enter.
2. This building and the addition will be used as a showroom for furniture samples and orders will be taken from the general public.
3. Since the area open to the public exceeds 10 percent of the total floor area, Group "E" becomes a major occupancy.

BCC Ruling No. 93-5-361

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-5-361

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PARTS,

3.4.6.15.(4) Electro Magnetic Locks

COMMISSION RULING:

In favour of the Applicant.

Regarding Hammerson Canada Inc., 201 City Centre Drive, Mississauga, Ontario.

It is the decision of the Building Code Commission that the requirements of the Code are met in the matter of electromagnetic locking devices that conform to the Code and providing there is compliance to the following:

1.
    a. U.L.C. Standards require that the fire alarm system continue to detect alarm conditions and operate normally under a single ground fault condition such as the common trouble circuits, and
    b. if the electromagnetic locking devices have been designed to immediately release only if there is a double ground fault on the fire alarm detection circuit equivalent to the operation of detection device that would cause the fire alarm system to activate, this design will be considered to have sufficiency of compliance.

REASONS:

While the Code is a minimum requirement, the above maintains security at the highest degree without jeopardizing life safety of the occupants by providing fail safe requirements.

RECOMMENDATION:

That the Ontario Buildings Branch assemble a meeting of all concerned parties to review and amend the Code requirements for all electromagnetic locking devices.

BCC Ruling No. 93-4-360

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-4-360

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PARTS,

3.4.6.15.(4) Electro Magnetic Locks

COMMISSION RULING:

In favour of the Applicant.

Regarding Bank of Canada, Toronto Agency Operation Centre, 5990 Explorer Drive, Mississauga, Ontario.

It is the decision of the Building Code Commission that the requirements of the Code are met in the matter of electromagnetic locking devices that conform to the Code and providing there is compliance to the following:

1.
    a. All electromagnetic locking devices shall be designed and installed to operate as per the requirements of "Lighting and Emergency Power Supply" of the Code, and
    b. the electromagnetic locking devices shall fail safe open on a failure of the primary building power supply, the emergency building power supply and the emergency power to the fire alarm panel where provided, and
    c. can only be reset manually or remotely by authorized personnel, and
2.
    a. U.L.C. Standards require that the fire alarm system continue to detect alarm conditions and operate normally under a single ground fault condition such as the common trouble circuits, and
    b. if the electromagnetic locking devices have been designed to immediately release only if there is a double ground fault on the fire alarm detection circuit equivalent to the operation of detection device that would cause the fire alarm system to activate, this design will be considered to have sufficiency of compliance.

3. The manual station for the fire alarm system located on the wall not more than 600mm (23 5/8 in.) from the door, shall be so installed that in addition to activating the fire alarm system, this pull station shall release the electromagnetic locking device on the adjacent door, and
4. where there is a "two stage single or multi zone" fire alarm system locking devices need not be released on the first stage "alert", from the two stage fire alarm system, and
5. where there is a "two stage single or multi zone" fire alarm system locking devices within and those leading from the zone of activation to the exit(s) shall release immediately on the second stage "alarm" of the two stage fire alarm system, and
6. authorized personnel shall be able to release the locking devices on any door(s) from a location within or adjacent to the zone of activation by a manually operated switch.

REASONS:

i. Highly trained security personnel will be constantly on duty to investigate any first stage alarm.
ii. This building is a highly secured building not open to the public.

RECOMMENDATION:

That the Ontario Buildings Branch assemble a meeting of all concerned parties to review and amend the Code requirements for all electromagnetic locking devices.

BCC Ruling No. 93-3-359

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-3-359

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PARTS,

3.4.6.15.(4) Electro Magnetic Locks

COMMISSION RULING:

In favour of the Applicant.

Regarding General Motors of Canada, Chassis Plan (South Plant), 800 Park Street South, Oshawa, Ontario.

It is the decision of the Building Code Commission that the requirements of the Code are met in the matter of electromagnetic locking devices that conform to the Code and providing there is compliance to the following:

1. The red manual pull station to the fire alarm system located on the wall not more than 600 mm (23 5/8 in.) from the door, shall be so installed that in addition to activating the fire alarm system, this pull station shall release the electromagnetic locking device on the adjacent door, and this does not restrict the addition of other security release switches where desired, and
2. where there is a "two stage single or multi zone" fire alarm system, locking devices need not be released on the first stage "alert" from the two stage fire alarm system, and
3. where there is a "two stage single or multi zone" fire alarm system, locking devices within those leading from the zone of activation to the exit(s) shall release immediately on the second stage "alarm" of the two stage fire alarm system, and
4. authorized personnel shall be able to release the locking devices on any door(s) from a location within or adjacent to the zone of activation by a manually operated switch, and
5.
    a. All electromagnetic locking devices shall be designed and installed to operate as per the requirements of "Lighting and Emergency Power Supply" of the Code, and

   b. the electromagnetic locking devices shall fail safe open on a failure of the primary building power supply, the emergency building power supply and the emergency power to the fire alarm panel where provided, and
   c. the electromagnetic locking devices can only be reset manually or remotely by authorized personnel, and

6.
   a. U.L.C. Standards require that the fire alarm system continue to detect alarm conditions and operate normally under a single ground fault condition such as the common trouble circuits, and
   b. if the electromagnetic locking devices have been designed to immediately release only if there is a double ground fault on the fire alarm detection circuit equivalent to the operation of detection device that would cause the fire alarm system to activate, this design will be considered to have sufficiency of compliance.

7. Signage is only required for the required red manual pull stations on electromagnetic locked exit doors and does not prohibit the addition of other signs where desired.

REASONS:

1. The electromagnetic locking devices will only be installed on the doors to two small office areas which will only operate after normal office hours and on the door to the autogate that leads via a bridge to the parking area and is not a required exit.
2. All building occupants are trained in the use of fire and security pull stations, and
3. There is sufficient security personnel that would be available to investigate any first stage fire alarm signal.

RECOMMENDATION:

That the Ontario Buildings Branch should assemble a meeting of all concerned parties to review and amend the Code requirements for all electromagnetic locking devices.

BCC Ruling No. 93-2-358

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-2-358

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PARTS,

9.5.1. and 3 and 4 and 5 and 9.7.1.2.
Room/Space Dimensions and Minimum Glass Areas

COMMISSION RULING:

In favour of the Respondent.

Regarding Oxford Court Condominiums, 245 Elgin Street West, Cobourg, Ontario.

It is the decision of the Building Code Commission that this matter of natural lighting in the living/dining areas does not comply with the Code.

REASONS:

The glass area is less than 10 percent of the area served.

BCC Ruling No. 93-1-357

BUILDING CODE COMMISSION DECISION ON B.C.C. #93-1-357

IN THE MATTER OF BUT NOT LIMITED TO: Ontario Building Code, O/Reg. 413/90 as amended

PARTS, 11.2.2.1. and 3.2.9.3.
New Building Systems and F.H.C. water supply

COMMISSION RULING:

In favour of the Respondent

Regarding Ottawa Hunt & Golf Club, 3811 Bowesville Road, Ottawa, Ontario.

It is the decision of the Building Code Commission that this matter of extending standpipe and F.H.C. system to serve the new additional rooms and floor areas shall require a fire pump and generator to meet the requirements of the Code. Measures shall also be taken to prevent backflow into the potable water supply system. A siamese connection and supervision be added to the standpipe system.

REASONS:

The new construction is required to comply with Part 3 of the Ontario Building Code.

Ontario

Ruling No. 07-42-1171
Application No. B-2007-37

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 3.4.6.5.(8) of Regulation 403/97 ,as amended, (the Building Code).

AND IN THE MATTER OF an application by Mostafa Ahanchi, Mitchell C. Smith Architects, for resolution of a dispute with Brenda Campbell, Chief Building Official, City of Brampton, to determine whether the proposed guard, serving exterior exit stairs in a Group F, Division 2 industrial occupancy building and having been designed with horizontal members which will be located between 140 mm and 900 mm above the level being protected, provides sufficiency of compliance with Sentence 3.4.6.5.(8) of the Building Code at Costco Wholesale Canada Ltd., 8495 Goreway Drive, City of Brampton, Ontario.

APPLICANT	Mostafa Ahanchi Mitchell C. Smith Architects Bellevue, Washington
RESPONDENT	Brenda Campbell Chief Building Official City of Brampton, Ontario
PANEL	Tony Chow, Chair Gerry Egberts Yaman Uzumeri
PLACE	Toronto, Ontario
DATE OF HEARING	November 22, 2007
DATE OF RULING	November 22, 2007
APPEARANCES	Randy Brown Randal Brown Architect Ltd., Toronto, Ontario **Agent for the Applicant** Lillyan McGinn Manager of Plans and Permits City of Brampton, Ontario **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Order to Comply under the *Building Code Act*, *1992*, to remedy certain alleged code deficiencies at Costco Wholesale Canada Ltd., 8495 Goreway Drive, City of Brampton, Ontario.

The subject building is an existing Group F, Division 2 medium hazard industrial warehouse facility. The building is one storey in building height and has a building area of 33, 183 m^2. It is comprised of non-combustible construction material and is equipped with sprinkler and fire alarm systems but not a standpipe and hose system.

The existing warehouse has been extended at either end of the building and as a result, a total of twelve new exterior exit stairs were constructed. These exterior exit stairs have been equipped with guards that contain horizontal members between 140 mm and 900 mm above the level being protected.

The construction in dispute relates to the design of these guards installed for the twelve new exterior exit stairs. Specifically, the issue in dispute is whether the as-installed guards facilitate climbing.

2. Provisions of the Building Code in Dispute

3.4.6.5. Guards

(8) Unless it can be shown that the location and size of openings do not present a hazard, a *guard* shall be designed so that no member, attachment or opening located between 140 mm (5½ in) and 900 mm (2 ft 11 in) above the level being protected by the *guard* will facilitate climbing.

3. Applicant's Position

The Agent for the Applicant described the building as a Group F, Division 2 warehouse facility that was originally constructed in 1995 and informed the Commission that an addition to the building was constructed in 2006. He advised that the warehouse depot is a secure facility which is not open to the public. He indicated that there is a security booth located at the main entrance as well as high perimeter fencing which prevents unauthorized access to the site. In addition, he explained that the facility's security measures include exterior grounds patrols which are maintained around the clock, 365 days per year.

In addition, the Agent reported that the doors located on the landing that is protected by the subject guards only open from the inside and that there is no access from the outside. The doors are equipped with a panic set on the inside of the door. He claimed that there is limited use of these doors, which means that there is limited use of the exterior exit stairs.

The Agent stated that the issue before the Commission relates to climbability of the guards protecting twelve exterior exit stairs. He indicated that there is not an issue with the existing exterior stairs and added that the guards were designed and installed to match the existing guards. He stressed that the existing guards have served the existing stairs since 1995 and to date there have been no injuries related to the existing guards.

The Agent reported that, prior to 1997, the Building Code did not include provisions relating to the climbability of guards in industrial occupancies. He further reported that Sentence

3.4.6.5.(8), the provision in dispute, was introduced in the 1997 edition of the Building Code. He maintained that the intent of this provision was to require guards to be designed so that they are not climbable, unless it can be shown that the location and size of openings do not present a hazard to children. He argued that this code change was aimed at children, who are more likely to attempt to climb a guard, and for occupancies such as churches or shopping malls. In addition, he referred to the proposed Code change document for the 1997 edition of the Building Code, specifically referencing the reason for the proposed change, which indicated that the limits were being placed on the construction of guards to make them safer for children.

The Agent advised that based on the type of occupancy of the building, it is his belief that sufficiency of compliance with the intent of the Code has been achieved. He stated that the building is a warehouse depot that is not open to the public and that children would not be present at the site. He claimed that if the Code intended to ensure that guards could not be climbed at all that the Code would have been more explicit in its wording. He maintained that the as-installed guards do not present a hazard to children since children would not be present at the facility.

In summary, the Agent indicated that the real issue in dispute is not whether the guard facilitates climbing but rather whether or not it presents a hazard. He maintained that the occupancy of this specific building and the security measures that are in place adequately address the hazard associated with guard climability. In his opinion, the Agent argued that sufficiency of compliance has been achieved in this instance.

4. Respondent's Position

The Designate for the Respondent submitted that the subject guards include horizontal members between 140 mm and 900 mm above the level being protected by the guard and therefore, the guards do not comply with Sentence 3.4.6.5.(8) of the Building Code.

The Designate asserted that Sentence 3.4.6.5.(8) is not written in such a way so as to only apply to premises where the general public or children have access. She maintained that this Sentence applies to all occupancies. In support of this argument, she advised that Sentence 3.4.6.5.(6) which permits spacing of guards in industrial occupancies to be 200 mm apart. It is her opinion that the Building Code already anticipates the absence of children in industrial occupancies and as such, Sentence 3.4.6.5.(8) is intended to apply to all occupancies, including industrial occupancies.

The Designate submitted that the building permit for the existing guards was issued under the 1990 edition of the Building Code, which did not address the issue of climbability of guards and therefore the existing guards with horizontal members were in compliance with the 1990 Building Code. She indicated that regardless of the configuration of the existing guards or any previous Code requirements that pertained to design and/or configuration of guards, the design, construction and configuration of the subject guards must conform to the Building Code that was in effect at the time the permit was issued.

In response to the Agent for the Applicant's argument that a hazard does not exist since children will not be present at the site, the Designate maintained that there are many factors that contribute to the degree of hazard, such as the frequency of use of the stairs, exposure to weather conditions, and who uses the area.

In summation, the Designate declared that Sentence 3.4.6.5.(8) of the Building Code specifically speaks to a requirement for guards to not facilitate climbing, unless it can be shown that the location and size of openings do not present a hazard. She reiterated that it is the opinion of the

municipality that the subject guards facilitate climbing and further that the municipality is not convinced that the subject guards do not present a hazard. Therefore, the subject guards do not comply with the requirements of the Building Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposed guard, serving exterior exit stairs in a Group F, Division 2 industrial occupancy building and having been designed with horizontal members which will be located between 140 mm and 900 mm above the level being protected provides sufficiency of compliance with Sentence 3.4.6.5.(8) of the Building Code at Costco Wholesale Canada Ltd., 8495 Goreway Drive, City of Brampton, Ontario, on condition that:

a) Notices shall be permanently and prominently posted in the vicinity of the subject exterior exit stairs advising staff and personnel that the guards in these areas are not to be climbed.

6. Reasons

i) The subject building is a medium hazard industrial occupancy that serves as a distribution centre, which is not open to the public. The site is owned and occupied by Costco Wholesale Canada Ltd. and there are no other tenants located on the site.

ii) The Commission was advised that the depot has been constructed as a secure facility. A security booth located at the main entrance combined with a high perimeter fence prevents unauthorized access to the site. Exterior grounds patrols are conducted around the clock every day of the year. In addition, all staff are required to be participate in health and safety training.

iii) The doors leading to the stairs where the subject guards are located are not the main entrance doors. They are required exits and only open from the inside. There is no handle to open the door from the outside. Occupants of the building would enter the building through the main entrance doors.

iv) In the opinion of the Commission, the controlled access to the facility, the infrequent use of the stairs and the additional security measures in place at this facility along with adherence to the above noted condition provide sufficiency of compliance with Sentence 3.4.6.5.(8) of the Building Code.

Dated at Toronto this **22nd** day in the month of **November** in the year **2007** for application number **2007-37.**

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 9.9.4.4.(1) and Part 11 of Regulation 350/06, as amended, (the Building Code).

AND IN THE MATTER OF an application by Luc Lavoie, Design & Drafting, for the resolution of a dispute with Julia Tuff, Chief Building Official, Township of Russell, to determine whether the proposed relocation and subsequent renovation of the exterior, unenclosed exit stair, with adjacent unprotected openings, in an existing building with mixed-use occupancy, provides sufficiency of compliance with Sentence 9.9.4.4.(1) when considering Part 11 of the Building Code at 1047 Notre Dame, Township of Russell, Ontario.

APPLICANT	Luc Lavoie Design & Drafting Embrun, ON
RESPONDENT	Julia Tuff Chief Building Official Township of Russell
PANEL	Tony Chow, Chair Mina Tesseris Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	November 8, 2007
DATE OF RULING	November 8, 2007
APPEARANCES	Luc Lavoie Design & Drafting Embrun, ON **The Applicant** Charles Bray Building Inspector Township of Russell **Designate for the Respondent**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the proposed relocation and subsequent renovation of the exterior, unenclosed exit stair, with adjacent unprotected openings, in an existing building with mixed-use occupancy, provides sufficiency of compliance with Sentence 9.9.4.4.(1) when considering Part 11 of the Building Code at 1047 Notre Dame, Township of Russell, Ontario, on condition that:

a) The window located on the ground level below the subject stair shall be protected with wired glass in a fixed steel frame or glass block conforming to Articles 9.10.13.5. and 9.10.13.7. of the Building Code.

b) The smoke alarms which have been installed in the two apartment units shall be interconnected so that the activation of the alarm in one unit will cause the alarm in the adjacent unit to sound.

c) The entrance to the dwelling unit, located at the top of the subject stair, shall be protected with a closure providing a minimum fire resistance rating of 20 minutes.

Reasons

i) The existing building contained two separate, relatively small, dwelling units and the renovation did not result in a substantial change to the floor area of the building.

ii) The use of the building has not changed nor has the hazard index for the building been reduced as a result of the renovations.

iii) The building included an exit stair that served the two dwelling units which has been relocated to the other side of the building. In the opinion of the Commission, with adherence to the above noted conditions, the performance level of the relocated stair at least maintains an equivalent level of performance as the original stair.

iv) The interconnection of the smoke alarms, as detailed in Condition b) above, will provide early warning to the dwelling unit occupants in the event of a fire.

APPLICANT	Dr. Si & Wendy Lowry Homeowners Orillia, ON
RESPONDENT	Mike Diver Chief Building Official Township of Oro-Medonte
PANEL	Tony Chow, Chair. Gary Burtch Mina Tesseris
PLACE	Toronto, Ontario
DATE OF HEARING	November 8, 2007
DATE OF RULING	November 8, 2007
APPEARANCES	Dr. Si Lowry Orillia, ON **Applicant** Jack Steenhof Steenhof Building Services **Agent for the Applicant**

Note: The Respondent opted not to participate at the hearing and instead relied on written evidence submitted prior to the hearing.

RULING

1. Particulars of Dispute

The Applicant has received a permit under the *Building Code Act*, *1992* and is constructing a one storey, residential dwelling at 3901 – 10th Line North, Township of Oro-Medonte, Ontario.

The subject building is a one storey, Group C, detached single family dwelling unit. The dwelling has a building area of approximately 220m^2 containing a "breeze-way" area of approximately 22m^2 and a garage having an area of 63m^2. The subject dwelling will be constructed of combustible construction materials.

The dwelling is described as a timber frame house, having been constructed using post and beam members for structural integrity. The exterior walls of the dwelling have been infilled with non-structural straw bales between the post and beam members.

The wall assembly has been constructed using compressed, stacked straw bales with a plastic polypropylene mesh installed on both the interior and exterior surface. The plastic mesh will be stitched to the straw bales using polypropylene twine. Three layers of stucco, a base coat, a scratch coat and a finish coat, will be applied directly to the plastic mesh on both the interior and exterior surfaces of the straw bales. The outermost coat will be smoothed to a finished texture. A coat of water based casein paint will be applied to the interior walls whereas the exterior surface of the straw bale assembly will include a water repellent paint on top of the three layers of stucco.

The construction at dispute between the parties relates to the roof overhang at two locations in the house, specifically, the north walls of the master suite/bedroom and the dining room area. The roof construction consists of the timber frame trusses and structural insulated panels supported by structural posts and beams.

The issue in dispute as presented to the Commission pertains to the roof overhang on the north side of the dwelling and whether a 600 mm roof overhang will provide sufficient protection of the exterior wall from precipitation.

2. Provisions of the Building Code in Dispute

Section 5.6. Precipitation

5.6.1. Protection from Precipitation

5.6.1.1. Required Protection from Precipitation

(1) Except as provided in Sentence (2), where a building component or assembly is exposed to precipitation, the component or assembly shall,
(a) minimize ingress of precipitation into the component or assembly, and
(b) prevent ingress of precipitation into interior space.

(2) Protection from ingress of precipitation is not required where it can be shown that such ingress will not adversely affect any of,
(a) the health or safety of building users,
(b) the intended use of the building, or
(c) the operation of building services.

5.6.1.2. Protective Material and Component Properties

(1) Except as provided in Sentence (2), where western cedar shakes or shingles are installed to provide the required protection from precipitation,
(a) shakes shall be not less than No.1 or Handsplit grade, and
(b) shingles shall be not less than No. 2 grade.

(2) Where western cedar shakes or shingles are installed as undercoursing to provide required protection from precipitation on vertical assemblies, they shall be not less than No. 3 grade.

(3) Except as provided in Sentence (4), where eastern white cedar shingles are installed to provide the required protection from precipitation, they shall be not less less than B (clear) grade.

(4) Where eastern white shingles are installed as undercoursing to provide the required protection from precipitation on vertical assemblies, they shall be not less than C grade.

5.6.1.3. Installation of Protective Materials

(1) Where a material applied to a sloped or horizontal assembly is installed to provide required protection from precipitation and its installation is covered in the scope of one of the following standards, installation shall conform to the requirements of the respective standard:

(a) CAN/CGSB-37.51-M, “Application of Hot Applied Rubberized Asphalt for Roofing and Waterproofing”,
(b) CGSB 37-GP-55M, “Application of Sheet Applied Flexible Polyvinyl Chloride Roofing Membrane”,
(c) CAN3-A123.51-M, “Asphalt Shingle Application on Roof Slopes 1:3 and Steeper”, or
(d) CAN3-A123.52-M, “Asphalt Shingle Application on Roof Slopes 1:6 to less than 1:3”.

(2) Where masonry applied to vertical assemblies is installed to provide required protection from precipitation, installation shall conform to the requirements of CSA A371, “Masonry Construction for Buildings”.

(3) Where protective materials are applied to assemblies to provide the required protection from precipitation, the materials shall be installed so as to shed precipitation or otherwise minimize its entry into the assembly and prevent its penetration through the assembly.

5.6.2. Sealing, Drainage, Accumulation and Disposal

5.6.2.1. Sealing and Drainage

(1) Except as provided in Sentence (2), materials, components, assemblies, joints in materials, junctions between components and junctions between assemblies exposed to precipitation shall be,
(a) sealed to prevent ingress of precipitation, or

(b) drained to direct precipitation to the exterior.

(2) Sealing or drainage are not required where it can be shown that the omission of sealing and drainage will not adversely affect any of,
(a) the health or safety of building users,
(b) the intended use of the building, or
(c) the operation of building services.

5.6.2.2. Accumulation and Disposal

(1) Where water, snow or ice can accumulate on a building, provision shall be made to minimize the likelihood of hazardous conditions arising from such accumulation.

(2) Where precipitation can accumulate on sloped or horizontal assemblies, provision shall be made for drainage conforming with Section 7.4.

(3) Where downspouts are provided and are not connected to a sewer, provisions shall be made to,
(a) divert the water from the building, and
(b) prevent soil erosion.

(4) Junctions between vertical assemblies, and sloped or horizontal assemblies, shall be designed and constructed to minimize the flow of water from the sloped or horizontal assembly onto the vertical assembly.

5.6.2.3. Solar Collector Systems

(1) A solar collector system is permitted to be installed above roofing materials conforming to Table 5.10.1.1.

3. Applicant's Position

The Applicant submitted that he was aware that straw bale construction is not prescribed by the Building Code and as such, he prepared an alternative solution package based on the applicable objective and functional statements of the Building Code.

The Applicant suggested that the Chief Building Official reviewed the package but indicated that he must comply with all of the conditions contained within a previous Building Code Commission ruling from 1999, which included a condition that the dwelling be constructed with a roof projecting 900 mm over the walls of the house. The Applicant argued that those conditions were site specific to that specific construction project and were not necessarily applicable to his project.

The Applicant advised that he tried to work with the Chief Building Official to address his concern regarding a 900 mm roof overhang. However, he added that the Code does not prescriptively require a roof overhang of 900 mm and inferred that this requirement relates back to the 1999 Building Code Commission ruling.

The Applicant suggested that the applicable objective and functional statements of the Building Code indicate that where exterior wall assemblies are exposed to precipitation, they are required to resist the ingress of precipitation, water or moisture from the exterior so that the structural integrity of the wall is maintained. He added that other objectives include limiting the probability

that a person will be exposed to an unacceptable risk of injury due to structural failure caused by damage or deterioration of building elements and that occupants of the building are not exposed to an unacceptable risk of illness due to moisture, inadequate air quality or thermal comfort.

The Applicant indicated that he had hired professional engineering consultants, who have had experience in straw bale construction, to assist in the design and construction of this dwelling. He stated that his consultants are of the opinion that a roof overhang of 600 mm is sufficient and will provide the wall in question with adequate protection from precipitation.

In describing the north wall that is at issue in this dispute, the Applicant stated that the north wall has been constructed on top of an ICF wall. He added that there will be eavestroughing and that the upper portion of the wall in question is adequately protected by a sealed soffit. It is his opinion and, indeed, the opinion of his professional consultants that a 600 mm roof overhang will meet the performance level required by the Building Code. In addition, he declared that his construction project needs to comply with the intent and objectives of the Building Code and not with any previous ruling of the Building Code Commission.

In summary, the Applicant indicated that it his belief that the design and construction of this dwelling unit provides the same level of performance as is required by the Building Code. He re-iterated that he has consulted with professional engineers, who have a background in building science and strawbale construction, and has provided documents to both the Chief Building Official and the Commission to support his claim that an overhang of 600 mm will provide the north wall with sufficient protection from precipitation.

4. Respondent's Position

As noted above, the Respondent did not appear at the hearing to provide oral testimony, instead choosing to rely on the written submissions provided to the Commission prior to the hearing.

It is the position of the Respondent that straw bale construction is not prescribed in the Building Code. He submitted that he reviewed the Applicant's proposal and in order to issue the building permit, had imposed a condition which required that a 900 mm overhang be provided for the protection of the upper portion of the wall.

The Respondent is of the opinion that an overhang of not less than 900 mm should be provided in order to ensure that the wall is adequately protected from precipitation. Further, it his is opinion that this condition is not unreasonable given the fact that the wall assembly is comprised of straw bale construction.

In the opinion of the Respondent, a minimum 900 mm roof overhang must be provided at the north side of the house in order to meet the requirements of the Building Code related to protection of the exterior wall from precipitation.

5. Commission Ruling

It is the Decision of the Building Code Commission that a proposed roof projection of 600 mm provides sufficiency of compliance with Section 5.6 of the Building Code at 3901 – 10th Line North, Township of Oro-Medonte, Ontario.

6. Reasons

i) The Commission was presented with documentation prepared by a professional engineer who has expertise in building science and straw bale construction in support of the proposed roof projection. The documentation concluded that the roof projection provides the wall below with sufficient level of protection against precipitation.

ii) The north wall of the dwelling unit, which is the wall in question, is one storey in height and has limited straw bale infill included in its design. When considering the height of the wall in relation to the length of roof overhang that has been proposed, it is the opinion of the Commission that the proposed roof projection will provide a sufficient level of protection against precipitation

iii) The soffit line will be horizontal and below the junction of the box beam and the straw bale assembly.

iv) The straw bale/box beam junction line has been reinforced with metal lathe and plaster.

v) The Commission was advised that plaster will be applied to the face of straw bale and box beam above the soffit line prior to the installation of the soffit.

Application No. 2007-35

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Articles 9.10.12.3. and 9.10.15.4. of Regulation 350/06, as amended, (the Building Code).

AND IN THE MATTER OF an application by Dick Splinter, Braebury Homes, for resolution of a dispute with Terry Willing, Chief Building Official, City of Kingston, to determine whether the proposal to include unprotected openings in the exposing building faces in multiple units of a two storey townhouse building, where there are limiting distances of less than 1.2 m between fire compartments of the same property, provides sufficiency of compliance with Articles 9.10.12.3. and 9.10.15.4. of the Building Code at Blocks 88 and 90, Crossfield Avenue, City of Kingston, Ontario.

APPLICANT	Dick Splinter Braebury Homes Kingston, ON
RESPONDENT	Terry Willing Chief Building Official City of Kingston
PANEL	Tony Chow, Chair Gary Burtch Mina Tesseris
PLACE	Toronto, Ontario
DATE OF HEARING	November 8, 2007
DATE OF RULING	November 8, 2007
APPEARANCES	Dick Splinter Braebury Homes Kingston, ON **The Applicant** Steve Murphy Deputy Chief Building Official City of Kingston **Designate for the Respondent** Lisa Capener-Hunt Building Official City of Kingston **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received a permit under the *Building Code Act*, *1992* and is constructing a two storey building that is to be comprised of four, two storey townhouses.

The subject building is described as having a Group C, residential major occupancy that will be two storeys in building height. The building area is 264 m^2 and the building will be comprised of combustible construction material. The subject building is not equipped with a sprinkler system, a fire alarm system or a standpipe and hose system.

The Applicant is of the opinion that the townhouse units are units within the same building, therefore, he has cited Article 9.10.12.3. of the Building Code as allowing unprotected openings provided they are more than 1.2 m apart.

It is the opinion of the Respondent that the townhouse units are individual units within separate buildings, therefore, he has cited Article 9.10.15.4. of the Building Code which does not permit glazed openings within 1.2 of the limiting distance line in an exposing building face unless the opening is protected.

The design of this building is based on the 2006 edition of the Building Code. The drawings submitted to the Commission with the Application for Hearing did not include the line to which "limiting distance" would be measured.

The matter in dispute between the parties appears to relate to the spatial separation between houses and glazed openings in exposing building faces. However, based on the information submitted by both parties, the specifics of the dispute were not entirely clear to the Commission. It was particularly unclear whether this building has been designed as one building on one lot with four units or four buildings on four separate lots. The design assumption behind this project is an important matter that needs to be clarified in order for the Commission to fully comprehend the specific issue in dispute.

2. Provisions of the Building Code in Dispute

9.10.12.3. Exterior Walls Meeting at an Angle

(1) Except as provided in Article 9.9.4.5., where exterior walls of a *building* meet at an external angle of less than 135°, the horizontal distance from an opening in one wall to an opening in the other wall shall be not less than 1 200 mm where the openings are in different *fire compartments*.

(2) The exterior wall of each *fire compartment* referred to in Sentence (1) within the 1 200 mm distance, shall have a *fire-resistance rating* not less than that required for the interior vertical *fire separation* between the compartment and the remainder of the *building*.

9.10.15.4. Glazed Openings in Exposing Building Face

(1) Except as provided in Sentences (3) to (5), the maximum area of glazed openings in an exposing building face shall,

(a) conform to Table 9.10.15.4.,
(b) conform to Subsection 3.2.3., or

(c) be equal to or less than the limiting distance squared.

(2) Where the exposing building face is divided into individual portions as described in Subclause 9.10.15.2.(1)(b)(iii),

(a) the maximum glazed area of each individual portion shall be determined in accordance with Sentence (1),
(b) the maximum aggregate glazed area for the entire exposing building face shall be the sum of the individual maximum glazed areas determined from Clause (a), and
(c) except as required in Sentence (4), the maximum aggregate glazed area determined in Clause (b) is permitted to be distributed anywhere on the exposing building face.

(3) The limits on area of glazed openings shall not apply to the exposing building face of a dwelling unit facing a detached garage or accessory building where,

(a) the detached garage or accessory building serves only one dwelling unit,
(b) the detached garage or accessory building is located on the same property as that dwelling unit, and
(c) the dwelling unit served by the detached garage or accessory building is the only major occupancy on the property.

(4) Except as permitted in Sentence (5), openings in a wall having a limiting distance of less than 1.2 m shall be protected by closures, of other than wired glass or glass block, whose fire-protection rating is in conformance with the fire-resistance rating required for the wall.

(5) An opening in an exposing building face not more than 130 cm^2 shall not be considered an unprotected opening.

Table 9.10.15.4.
Maximum Area of Glazed Openings in Exterior Walls of Buildings Containing Only Dwelling Units
Forming Part of Sentence 9.10.15.4.(1)

Over 100	0	7	7	8	9	10	12	19	28	40	55	92	100	—		

3. Applicant's Position

The Applicant submitted that the dispute relates to whether unprotected openings are allowed within 1.2 m of the centre line of separate fire compartments. He suggested that by virtue of Article 9.10.12.3. of the Building Code, it would be permissible to have unprotected openings provided the openings were 1.2 m apart.

The Applicant further submitted that Article 9.10.15.4. provides three ways in which to comply with this provision. Clause 9.10.15.4.(1)(b) requires conformance to Subsection 3.2.3. He submitted that by virtue of Sentence 3.2.3.14.(1) unprotected openings are permitted if the wall faces intersect at an angle of 135^{o} or greater and added that the design of the subject building meets this criteria. In addition, he stated that Sentences 9.10.15.2.(4) and 9.10.15.2.(5) allows the relocation of the line to which limiting distance is measured and further stated that this option was offered to the municipality in of hopes resolving this issue.

The Applicant suggested that the line to which limiting distance is measured can be relocated so as to meet the requirements of the Building Code. Therefore, he believes that there is nothing for the Commission to rule on. He claimed that the municipality is not willing to look beyond Article 9.10.15.4. of the Code and that is why this matter is before the Commission.

When questioned as to the design of this project, the Applicant indicated that it has been designed as one building with four individual units and therefore the party walls provide the property line. Under this assumption, the Applicant believes that the proposal to include unprotected openings in the exposing building face not only sufficiently complies with the requirements of the Building Code but fully complies with the requirements of the Building Code. This, in his opinion, is especially true if, by virtue of the Sentences 9.10.15.2.(4) and 9.10.15.2.(5), the line to which limiting distances is measured is relocated.

The Applicant agreed that the parties to this dispute are not in agreement as to the basic design assumptions of this building and as such it is not clear which specific provisions of the Code would be applicable to this project.

4. Respondent's Position

The Designate for the Respondent submitted that the spatial separation between houses is not in compliance with the Building Code, as Article 9.10.15.4. does not permit glazed openings within 1.2 m of the limiting distance line in an exposing building face unless those openings are protected as per Sentence 9.10.15.4.(4) of the Code.

The Designate cited Article 1.4.1.2. of the Building Code as providing definitions for exposing building face and for limiting distance. She indicated that the Code defines limiting distance as the distance from an exposing building face to an imaginary line between fire compartments on the same property. She further indicated that exposing building face is defined as that part of the exterior wall that faces one direction and is located between ground level and the ceiling of its top storey, or, where the building is divided into fire compartments, the exterior wall of a fire compartment that faces one direction.

The Designate maintained that, in reviewing the plans submitted for this project, the municipality is of the opinion that the project includes four separate houses (buildings) joined by firewalls. She further maintained that, while this project is currently owned by one entity with individual dwelling units being rented out to tenants, it is entirely possible that the dwelling units could be sold off to separate owners. In fact, she indicated that the municipal planning department has already received an application to permit these buildings to be separated and the units sold off

individually. Therefore, it is the opinion of the municipality that this property should be designed and constructed as four individual buildings on four separate properties.

When questioned, the Designate agreed that the matter at issue between the parties really pertains to the basic design assumptions for the building and that the parties are not in agreement as to the design assumptions.

5. Commission Ruling

It is the Decision of the Building Code Commission that, under Clause 24(1)(a) of the *Building Code Act,* 1992, the Commission does not have the jurisdiction to render a ruling in respect of a disagreement regarding which technical requirements would be applicable.

6. Reasons

i) The jurisdiction of the Building Code Commission under s. 24(3) of the *Building Code Act, 1992*, is to "determine a dispute identified in Clause 24(1)(a)." The dispute identified in s. 24(1)(a) is one "concerning sufficiency of compliance with the technical requirements of the Building Code."

ii) The jurisdiction of the Commission under s. 24(3) of the Act relates to the determination of "a dispute", and is accordingly limited to a dispute about a particular technical requirement that has been identified by the parties.

iii) During the course of the hearing it became apparent that the parties are not in agreement with respect to the basic design assumptions for this building. Consequently, the parties were not in agreement as to which provision of the Building Code was applicable to the subject property.

iv) As a result of the inconsistent design assumptions expressed by the parties and the lack of agreement between the parties as to which provision of the Building Code was in dispute, it is not possible for the Commission to render a ruling in respect of which technical requirement is applicable.

APPLICANT	1527102 Ontario Ltd
RESPONDENT	Robin Williams Medical Officer of Health Niagara Region Public Health
PANEL	Eric Gunnell, Chair-Designate
PLACE	Toronto, Ontario
DATES OF HEARING	October 22, 2007, November 15, 2007, December 13, 2007
DATE OF RULING	December 13, 2007
APPEARANCES	Gerry Dignard Canadian Shield Consultants Agency Inc., - and – Alex Kosopov **Agents for the Applicant** Alphie Wolf Public Health Inspector Niagara Region Public Health - and – Bill Hunter Manager, Health, Protection and Promotion Niagara Region Public Health **Designates for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for seven (7) permits under the *Building Code Act*, *1992*, to construct seven (7) individual Class 4 sewage systems to service seven (7) individual residential dwellings at 16006 Niagara River Parkway (Lots 1-7, Plan 327), Town of Niagara-on-the-Lake, Ontario**.**

The subject buildings are described as residential dwelling units, each having a total finished area of 371 m^2 and two storeys in building height. Each building will contain five bedrooms with 34.5 fixture units and the water supply will be provided by the municipal water supply. The total daily design flow of each lot has been calculated at 4 300 L/day. The sewage systems proposed to service each of these seven lots will consist of a 10 000 L septic tank connected to two 4 400 L tertiary treatment units.

The Parties identified Sentences 8.2.1.2.(1), 8.2.1.2.(3), Clauses 8.7.3.2.(2)(e), 8.7.4.2.(1)(b), 8.9.1.2.(1)(c) and Subclause 8.7.2.1.(1)(b)(i) as being the technical provisions of the Building Code that were in dispute.

The hearing commenced on October 22, 2007 and was adjourned until November 15, 2007. The hearing resumed on November 15, 2007 and was further adjourned until December 13, 2007.

At the resumption of the hearing on December 13, 2007, the parties informed the Commission that the disputes relating to Sentences 8.2.1.2.(1), 8.2.1.2.(3), Clauses 8.7.3.2.(2)(e), 8.7.4.2.(1)(b), and Subclause 8.7.2.1.(1)(b)(i) of the Building Code had been resolved.

The only dispute remaining concerned the requirement that the Applicant provide, in respect of each of the permit applications, a hydrogeological analysis in accordance with Guideline B7, procedure D54 technical Guideline for Individual On-Site Sewage Systems: Water Quality Impact Risk Assessment ("Hydrogeological Reports"), and that a peer review of the analysis be completed and submitted to ensure that the report meets Ministry of Environment Policy D54.

2. Provisions of the Building Code in Dispute

While certain technical requirements of the Building Code were initially identified by the Parties as being in dispute, during the course of the hearing the Parties resolved all disputes relating to these requirements.

3. Applicant's Position

The Agent for the Applicant submitted that the applications for the permits at issue in this matter complied with all of the applicable requirements of the Act and the Building Code. He further submitted that the Respondent had not identified a provision of the Act or the Building Code which authorized the Respondent to require that the Hydrogeological Reports be provided and, in particular, the neither s. 18 of the Act nor Clause 8.9.1.2.(1)(c) of the Building Code provided this authority.

The Agent submitted that any dispute about the Respondent's right under other legislation to require the Hydrogeological Reports would not be a dispute that is within the jurisdiction of the Building Code Commission. The Agent requested that the Commission direct the Respondent to issue the building permits.

4. Respondent's Position

The Designate for the Respondent expressed concerns over the potential impact from the construction of seven "estate" dwellings with individual private sewage systems on little more than two acres, and took the position that the Hydrogeological Reports were necessary to ensure that there is no adverse effect to the groundwater.

The Designate submitted that, given these concerns, Clause 8.9.1.2.(1)(c) of the Building Code was relevant to the applications, and that the Hyrdrogeological Reports were necessary to evaluate compliance with Clause 8.9.1.2.(1)(c). The Commission noted that Section 8.9 of the Building Code applies to the operation and maintenance of existing sewage systems and, as a result, Clause 8.9.1.2.(1)(c) would accordingly apply to existing sewage systems. The Designate for the Respondent accepted that Clause 8.9.1.2.(1)(c) applied to the maintenance and operation of existing sewage systems, rather than the design or construction of new sewage systems, and indicated that it no longer relied on this Clause in regard to the Hydrogeological Reports.

5. Commission Ruling

It is the Decision of the Building Code Commission that, under Clause 24 (1)(a) of the *Building Code Act, 1992*, the Commission does not have the jurisdiction to render a ruling in respect of disputes concerning the powers of a Chief Building Official under the Act or other legislation to require that the Applicant provide the Hydrogeological Reports or to direct the Respondent to issue building permits.

6. Reasons

i) The jurisdiction of the Commission under s. 24(3) of the *Act* is to "determine a dispute identified in clause 24(1)(a)." The dispute identified in s. 24(1)(a) is one "concerning the sufficiency of compliance with the technical requirements of the Building Code."

ii) The jurisdiction of the Commission under s. 24(3) of the *Act* relates to the determination of "a dispute", and is accordingly limited to a dispute about a particular technical requirement that has been identified by the parties.

iii) In the course of the hearing, the Applicant and Respondent resolved all of the disputes concerning sufficiency of compliance with the technical requirements of the Building Code that had been identified as being in dispute. Therefore, there was no basis for the Commission to render a ruling concerning the sufficiency of compliance with the technical requirements of the Building Code.

iv) Disputes concerning compliance with the *Act* or other legislation are not disputes which are identified in Clause 24(1)(a) of the *Act*. Therefore, the Commission does not have the jurisdiction to determine disputes concerning compliance with the *Act* or other legislation.

v) The Commission's jurisdiction under Clause 24(1)(a) of the *Act* to "determine" disputes is limited to ruling on the sufficiency of compliance with the technical requirement of the Building Code that are the subject of the dispute. This jurisdiction does not include directing the chief building official to issue a building permit.

Dated at Toronto this **13th** day in the month of **December** in the year **2007** for application number **2007-03.**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the installation of the Von Duprin less bottom rod fire exit devices on doors which are required to be fire-protected provides sufficiency of compliance with Sentences 3.1.8.5.(2), 3.1.8.13.(1), 3.3.2.6.(1), Articles 3.3.1.12. and 3.4.6.15. of the Building Code at the Royal Court Medical Building, 5 Quarry Ridge Road, City of Barrie, Ontario, on condition that:

a) The fire safety plan shall include drawings indicating the location of the doors that are equipped with the Von Duprin less bottom rod fire exit devices, and

b) A notice is to be permanently mounted at the annunciator panel indicating that doors equipped with Von Duprin less bottom rod fire exit devices are located at the walkway connecting the two buildings.

Reasons

i) In the opinion of the Commission, the subject doors achieve the level of fire protection required by the Code as was evidenced by the testing documentation that was provided.

ii) In the opinion of the Commission, the occupant load of the subject building is relatively low and further, the life safety of the occupants of the building is not compromised by the installation of the auxiliary fire latch.

iii) The subject doors provide access to a ground level walkway connecting two buildings. Further, the subject doors are located in an access to exit and there are other means of egress from both buildings and the walkway.

iv) There are glazed areas located adjacent to the subject doors which are equipped with the auxiliary fire latch. In the event of a fire situation, emergency response personnel can obtain access to the building or walkway through the glazed openings.

RULING

1. Particulars of Dispute

The Applicant has received a permit under the *Building Code Act*, *1992*, and is constructing four townhouse buildings at 347 Royal York Road, City of Toronto, Ontario.

The project consists of four separate Group C residential buildings. Each building contains nine or ten individual townhouse units. The buildings are to be comprised of combustible construction material and will not be equipped with a standpipe and hose system or a fire alarm system. The Applicant is proposing that a sprinkler system not be installed.

There are a number of issues which are germane to the matter at dispute between the parties. The core issue relates to whether the buildings are required to be equipped with a sprinkler system. If the buildings are considered to be four storeys in building height, Part 3 of the Building Code would be applicable and sprinklering would be a requirement for the buildings. If the buildings are considered to be three storeys in building height, Part 9 of the Building Code would be applicable and the buildings would not require sprinklering. Therefore, the height of the building is at issue, the Applicant has described the buildings as three storeys with a basement while the Respondent believes the buildings are four storeys in building height. In determining the height of the building, the Applicant is proposing to surround the basement level of the buildings with 900 mm high planters which will act as grade. Consequently, the definition of "grade" as defined in the Building Code is relevant to the dispute between the parties.

The dispute before the Commission is to determine whether the 900 mm high planters that the Applicant is proposing to construct around the buildings can be considered grade for the purposes of determining building height and the first storey of the subject residential townhouse buildings. Once the dispute regarding the height of the buildings has been resolved, it will be apparent whether the buildings fall under Part 3 or Part 9 of the Building Code and thus the issue of whether the buildings are required to be sprinklered or not will be resolved as well.

2. Provisions of the Building Code in Dispute

1.1.3.2. Defined Terms

(1) The words and terms in italics in this Code have the following meaning for the purposes of this Code, and where indicated, the following meaning for the purposes of the Act as well.

Grade means the average level of proposed or finished ground adjoining a building at all exterior walls.

2.1.1. Buildings

See Subsection 2.1.1. of the Building Code.

3.2.2.45. Group C, up to 4 Storeys, Sprinklered

(1) A building classified as Group C is permitted to conform to Sentence (2) provided
- (a) except as permitted by Sentence 3.2.2.7.(1), the building is sprinklered,
- (b) it is not more than 4 storeys in building height, and
- (c) it has a building area not more than
  - (i) 7 200 m2 (77,500 ft2) if 1 storey in building height,

(ii) 3 600 m2 (38,800 ft2) if 2 storeys in building height,
(iii) 2 400 m2 (25,800 ft2) if 3 storeys in building height, or
(iv) 1 800 m2 (19,400 ft2) if 4 storeys in building height.

(2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and
(a) except as permitted by Sentences (3) and (4), floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,
(b) mezzanines shall have a fire-resistance rating not less than 1 h, and
(c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

(3) In a building that contains dwelling units that have more than 1 storey, subject to the requirements of Sentence 3.3.4.2.(2), the floor assemblies, including floors over basements, which are entirely contained within these dwelling units, shall have a fire-resistance rating not less than 1 h but need not be constructed as fire separations.

(4) In a building in which there is no dwelling unit above another dwelling unit, the fire-resistance rating for floor assemblies entirely within the dwelling unit is waived.

9.1.1.1. Scope

(1) The scope of this Part shall be as described in Section 2.1. (See Section 9.36. regarding application to seasonally and intermittently occupied buildings.)

3. Applicant's Position

The Agent for the Applicant stated that the project consists of four separate residential townhouse buildings, with each building containing nine or ten individual freehold townhouse suites.

The Agent explained that the basement level of the buildings were intended to have been almost fully enclosed, however, as a result of encountering drainage problems, it became necessary to raise the basement levels approximately one metre. He indicated that the basement level of each building has been surrounded by 900 mm high planters and that, in his opinion, these planters act as grade. Further, he stated that as the ceiling of the lowest storey of each of the residential townhouse buildings is less than 1.8 m above the surrounding planters (grade), the lowest storey of each building is considered a basement.

The Agent advised that the Code defines grade as "average level of proposed or finished ground adjoining a building at all exterior walls". However, he indicated that the Code does not define proposed or finished ground nor does it define the width of the adjoining ground. In the absence of that definition, he contended that the proposed planters, with their maximum available width, are permitted to be considered as finished ground adjoining the subject buildings at all exterior walls. He explained that the dispute arose as a result of an internal policy and the claim of the municipality that the planters do not have sufficient width to act as grade. In response to questions regarding the depth of the planters, he indicated that the dimensions vary in depth between 600 mm and 1.5 m from face of the building to the edge of planter.

The Agent indicated that the buildings face at least two streets and that numerous fire hydrants are located within the vicinity of the buildings. He also indicated that the distance from street

level to the uppermost balcony does not exceed 7 m which in his opinion does not impede fire fighter access. He stated that it is his belief that the subject proposal allows fire fighters access to the building, addresses the exiting requirements, and achieves the required level of life safety intended by the Building Code.

In conclusion, he reiterated that the subject residential townhouse buildings are considered to be three storey buildings with one basement level. As such he indicated that Part 9 of the Building Code applies to the subject buildings and therefore the buildings are not required to be sprinklered.

4. Respondent's Position

The Designate for the Respondent described the residential townhouse buildings as consisting of four separate Group C residential buildings, each containing nine or ten individual freehold townhouse units. Each building is surrounded by 900 mm high discontinuous planter boxes of varying width. He submitted that based on the 1997 Building Code and the municipality's understanding of grade, each building was reviewed as a Part 3 four storey combustible building that would require the installation of sprinklers. He advised that the building permits were approved and issued based on the buildings being designed as four storey buildings, which included the installation of a sprinkler system and a fire alarm system.

The Designate advised that the municipality has established a policy for determining grade, which excludes superficially altering the ground level around the building by means of planters and/or exterior steps. In an effort to ensure some permanence of established grade/ground levels utilized in determining building height and number of storeys, he advised that the City had a policy of requiring a minimum of 2100 mm horizontal dimension of ground surface around the building face. He explained that this minimum dimension was deemed necessary in order to permit rescue ladders to service egress openings from upper floors.

The Designate maintained that the planters surrounding the subject buildings are not continuous; do not provide a level of permanence or an adequate surface for egress around the building. He suggested that, in his opinion, the use of superficial ground levels created by planters was never the intent of the definition of grade. He further suggested that accepting the use of planters as a means of raising the grade adjoining the building, for the purposes of determining the first storey, may also impact other Articles that mention "ground" or "adjacent ground level".

In summary, the Designate declared that the narrow planters which artificially build up grade cannot be considered as "proposed or finished ground" as referred to in the definition of grade. Therefore, the buildings are considered to be four storey buildings and as such are required to be equipped with a sprinkler system and fire alarm system.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposed construction of a Group C residential townhouse block does not provide sufficiency of compliance with Subsection 2.1.1. as a three storey building when considering the definition of "grade" as outlined in Article 1.1.3.2., Article 3.2.2.45. and 9.1.1.1. of the Building Code at 347 Royal York Road, City of Toronto, Ontario.

6. Reasons

i) In the opinion of the Commission, the use of 900 mm high planters to act as grade for the purposes of determining building height and the first storey of the subject residential townhouse buildings does not achieve the level of safety intended by the Building Code.

ii) The Commission was advised that the dimensions of the planters vary in depth between 600 mm and 1.5 m from face of the building to the edge of planter. It is the opinion of the Commission that this does not provide adequate level ground area for the provision of fire fighting operations, such as allowing the use of ladders and the deployment of fire fighters.

APPEARANCES	Lorne Haverty Lorne Haverty Ltd Architect Hamilton, ON **Agent for the Applicant** Dio Ortiz Chief Building Engineer City of Hamilton **Designate for the Respondent**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the vertical and horizontal piping for the proposed standpipe system which would not be protected with a two-hour fire rated separation provides sufficiency of compliance with Sentence 3.2.9.2.(1) and Clause 3.2.9.2.(9)(b) when considering Sentence 3.6.3.1.(1) of the Building Code at 260-280 King Street, East, City of Hamilton, Ontario, on condition that:

a) The vertical portion of the standpipe system piping, which is separated by a fire separation having a fire resistance rating of one hour provided on the unit side of the enclosure, shall also be provided with a fire separation having a fire resistance rating of one hour on the corridor side of the enclosure.

b) Any horizontal portions of the standpipe system piping which run through unsprinklered floor areas shall be provided with a fire separation having a fire resistance rating of one hour.

Reasons

i) Article 3.2.9.2. of the Building Code outlines the requirements for a required standpipe system. Sentence 3.2.9.2.(1) states “except as otherwise provided in this Subsection, if a standpipe system is required, the design, construction, installation and testing of a required standpipe system shall be in conformance with NFPA 14, “Standard for the Installation of Standpipe and Hose Systems”.

Sentence 3.2.9.2.(9) of the Code requires standpipe risers to be located in an exit shaft or a service space. This provision of the Building Code supersedes any related requirements contained in the referenced NFPA Standard.

ii) In the opinion of the Commission, provided that the vertical portions of the piping are separated from all other portions of each adjacent storey by a fire separation having a fire resistance rating equivalent to that which is outlined in Table 3.6.3.1. of the Code and adherence to the above noted condition sufficiency of compliance with the provisions of the Code will be achieved.

iii) Adherence to the above noted conditions will, in the opinion of the Commission, achieve sufficiency of compliance with the provisions of the Code.

APPLICANT	Ted Antkow Homeowner Mississauga, ON
RESPONDENT	Mr. Bill Goodale Chief Building Official C. C. Tatham & Associates Ltd.
PANEL	Judy Beauchamp, Vice-Chair Jim Wilkinson Eric Gunnell
PLACE	Toronto, Ontario
DATE OF HEARING	September 6, 2007
DATE OF RULING	September 6, 2007
APPEARANCES	Ted Antkow Homeowner Mississauga, ON **The Applicant** Bill Goodale Chief Building Official C. C. Tatham & Associates Ltd, ON **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Unsafe Order under the *Building Code Act*, *1992*, requiring that a building permit be obtained and that the existing sewage system be replaced at 305 Concession 11 W, Township of Tiny, Ontario.

The subject building is described as a one and a half storey, two bedroom, seasonal cottage, having a building area of approximately 64 m^2. The dwelling is served by a private dug well and has a total of 7.5 plumbing fixture units. The total daily design flow rate for this residential building is 1 000 litres per day. The site is described as sloping from east to west and the existing native soil, which is described as sand, provides a percolation time of approximately five to ten minutes per centimetre.

The construction in dispute relates to the proposal by the Applicant to upgrade the existing Class 4 sewage system by relocating the existing leaching bed and replacing the existing septic tank with a new 3 600 litre septic tank. The subject sewage system has been in existence for approximately 40-45 years. The existing sewage system consists of an 1 800 litre septic tank connected to an inground leaching bed. The absorption trenches of the leaching bed consist of two runs of three metre distribution pipe.

The issue at dispute pertains to whether the Applicant's proposal to replace the existing septic tank and relocate the leaching bed addresses the unsafe situation and provides sufficiency of compliance with Articles 8.2.1.6. and 8.7.3.2. when considering Part 11 of the Building Code.

2. Provisions of the Building Code in Dispute

8.2.1.6. Clearances for a Class 4 or 5 Sewage System

(1) Except as provided in Sentences 8.2.1.4.(1) and (2), a treatment unit shall not be located closer than the minimum horizontal distances as set out in Table 8.2.1.6.A.

(2) Except as provided in Sentences 8.2.1.4.(1) and (2), a distribution pipe shall not be located closer than the minimum horizontal distances set out in Table 8.2.1.6.B. and these distances shall be increased when required by Sentence 8.7.4.2.(9).

(3) Except as provided in Sentences 8.2.1.4.(1) and (2), a holding tank shall not be located closer than the minimum horizontal distances set out in Table 8.2.1.6.C.

8.7.3.2. Absorption Trenches

(1) Except as provided in Sentence (2), absorption trenches shall be,
- (a) approximately the same length and not more than 30 m in length, 8.7.3.3.
- (b) at least 500 mm and not more than 1 000 mm in width,
- (c) at least 300 mm and not more than 900 mm in depth,
- (d) centred at least 1 600 mm apart,
- (e) at least 900 mm at all points on the bottom of the absorption trench, or 900 mm from the surface of a filter bed above the high ground water table, rock or soil with a percolation time greater than 50 minutes, and
- (f) backfilled, after the installation of the distribution pipe with leaching bed fill,

so as to ensure that after the leaching bed fill settles, the surface of the leaching bed will not form any depressions.

(2) Absorption trenches constructed as shallow buried trenches shall be
- (a) approximately the same length and not more than 30 m in length,
- (b) at least 300 mm and not more than 600 mm in width,
- (c) at least 300 mm and not more than 600 mm in depth,
- (d) centred at least 1 600 mm apart,
- (e) at least 900 mm at all points on the bottom of the absorption trench above the high ground water table or rock, and
- (f) backfilled, after the installation of the distribution pipe with leaching bed fill, so as to ensure that after the leaching bed fill settles, the surface of the leaching bed will not form any depressions.

Part 11 – Renovation

(Please see Part 11 of the Building Code)

3. Applicant's Position

The Applicant provided the Building Code Commission (the "Commission") with a brief overview of the existing sewage system and outlined the history of the dispute between the parties. He stated that the subject building is a seasonal family dwelling that has been in existence for approximately 55 years.

The Applicant reported that he was proposing to install a new septic tank and would be willing to relocate the existing leaching bed, if necessary. He indicated that typical lot sizes in the area are 15 m (50 ft.) wide by 38 m (125 ft.) deep. He added that relocating one part of the sewage system in order to meet the minimum setback requirements to the adjacent lake would negatively impact the minimum setback requirements to his well, five adjacent neighbouring wells, the structure and the property line.

The Applicant advised that it is his belief that this proposal meets the intent of Part 11 of the Building Code. He stated that by replacing the septic tank and relocating the leaching bed, he is improving the performance level of the existing sewage system.

In response to questions regarding the depth to the groundwater table, the Applicant advised that when he was requested to excavate as part of the inspection process, he noted that the depth was approximately 700 mm to the groundwater table.

The Applicant asserted that he is putting forth his best effort to remedy the situation. He maintained that he complies with the requirements of Article 8.7.3.2. He noted that Sentence 8.2.1.4.(1) states "unless it can be shown to be unnecessary, where the percolation time is 10 minutes or greater, the location of all components within a sewage system shall be in conformance with the clearances listed in Articles 8.2.1.5. or 8.2.1.6." He indicated that this Code reference clearly indicates that there is some room for leniency regarding the minimum clearance distances.

In summation, the Applicant declared that he believes the evidence presented to the Commission supports his claim that he meets the provisions of Articles 8.2.1.6. and 8.7.3.2., especially when considering Part 11 of the Building Code, and as such the Commission should find for sufficiency of compliance in this matter.

4. Respondent's Position

The Respondent reported that this matter has been on-going for four years. He stated that, in his opinion, both the existing situation and the proposal put forth by the Applicant are unsafe. He asserted that as the Chief Building Official for Sewage Systems for the Township of Tiny, it is his duty to prevent the contamination of the groundwater from any new or existing sewage systems.

The Respondent maintained that the existing sewage system, in his opinion, is unsafe. Further, he added that the proposal of the Applicant to install a new septic tank and possibly relocate the leaching bed does not address the concerns outlined in the Unsafe Order. As such, it is his opinion that the proposed solution still results in an unsafe condition.

In response to questions regarding depth to the groundwater table, the Respondent indicated that he believed the depth to the high groundwater table to be about 500 mm. He added that a site inspection also revealed the depth to the standing water table to be approximately 600 mm. He added that the distribution pipe is approximately 400 mm above the standing water table and 100 mm above the high water table. In addition, the Respondent noted that the location of the existing distribution pipe provides less than the minimum clearance distance to five surrounding wells.

The Respondent maintained that the Applicant's proposal does not address the concerns outlined in the Unsafe Order that has been issued. He reiterated that the Applicant's proposal does not meet the minimum requirements stipulated in Sentences 8.2.1.6.(1) and 8.2.1.6.(2) of the Building Code with respect to clearance distances nor does the proposal meet the requirements of Clause 8.7.3.1.(1)(b) for minimum length of distribution pipe. He claimed that the sewage system has not been maintained and operated in accordance with Section 8.9 of the Building Code.

The Respondent summarized his position by reiterating that it is his duty, as Chief Building Official of Sewage Systems, to enforce the Building Code and to ensure the health and safety of the public. He declared that neither the existing sewage system nor the proposed sewage system meet the requirements of the Building Code and do not remedy the issues raised in the Unsafe Order.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposal to relocate the existing tile bed and install a new 3 600 litre septic tank intended to remedy an Unsafe Order issued in respect of the existing Class 4 sewage system does not provide sufficiency of compliance with Articles 8.2.1.6. and 8.7.3.2. when considering Part 11 of the Building Code at 305 Concession 11 W, Tiny Township, Ontario.

6. Reasons

i) The proposal does not remedy the concerns identified in the Unsafe Order nor does it provide sufficiency of compliance with Clause 8.7.3.2.(1)(e) of the Building Code, which requires absorption trenches to be located so that the bottom of the trench is not less than 900 mm above the high groundwater table, rock or soil with a percolation time greater than 50 minutes per centimetre.

ii) The Commission recognizes that the subject sewage system has been in existence for at least five years and therefore Part 11 of the Building Code applies in this instance. However, even when considering the compliance alternatives outlined in Part 11 of the Code, in the opinion of the Commission the health and safety concerns identified by the Respondent in the Unsafe Order that was issued have not been addressed.

AND IN THE MATTER OF Article 3.2.9.2, of the Regulation 403/97, as amended, (the Building Code).

AND IN THE MATTER OF an application by Paul Svastal, Paul & Douglas Sprinklers Ltd., for the resolution of a dispute with Mike Leonard, Chief Building Official, City of Oshawa, to determine whether the proposed standpipe and hose system, where the hose valves in the fire hose cabinets will be pressure restricting valves and where 75 mm (3 in) drain risers will not be installed, provides sufficiency of compliance with Article 3.2.9.2. of the Building Code at Durham Consolidated Courthouse, 150 Bond Street East, City of Oshawa, Ontario.

APPLICANT	Paul Svastal Paul & Douglas Sprinklers Ltd. Mississauga, ON
RESPONDENT	Mike Leonard Chief Building Official City of Oshawa
PANEL	Tony Chow, Chair Gerry Egberts Mina Tesseris
PLACE	Toronto, Ontario
DATE OF HEARING	August 23, 2007
DATE OF RULING	August 23, 2007
APPEARANCES	Douglas Svatsal Mississauga, ON **The Applicant** S.K. Lo Manager, Building Permits Services City of Oshawa **Designate for the Respondent**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the proposed standpipe and hose system, where the hose valves in the fire hose cabinets will be pressure restricting valves and where 75 mm (3 in) drain risers will not be installed, does not provide sufficiency of compliance with Article 3.2.9.2. of the Building Code at Durham Consolidated Courthouse, 150 Bond Street East, City of Oshawa, Ontario.

Reasons

i) Sentence 3.2.9.2.(1) of the Building Code requires that, where a standpipe system is required, the design, construction, installation and testing of the system be in conformance with NFPA 14, "Standard for the Installation of Standpipe and Hose Systems."

The Code does not contain a specific provision regarding drain risers and therefore the requirements outlined in NFPA 14 regarding drain risers apply.

NFPA 14 states that "A permanently installed 3-in. (76-mm) drain riser shall be provided adjacent to each standpipe equipped with pressure-regulating devices to facilitate tests of each device."

NFPA 14 also defines a "pressure-regulating device" as "a device designed for the purposes of reducing, regulating, controlling, or restricting water pressure. Examples include pressure-reducing valves, pressure control valves, and pressure-restricting devices."

ii) The subject valve is a "pressure-restricting device" which is a form of "pressure-regulating device" and therefore a drain riser is required as per the requirements of Sentence 3.2.9.2.(1) of the Building Code and NFPA 14.

APPEARANCES	Deborah McMahon Grey Forest Homes Ltd., St. Catharines, ON **Agent for the Applicant**
	Keegan Gennings Building Inspector Town of Niagara-on-the-Lake, ON **Designate for the Respondent**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the as-installed interior stair, where the structural post for the handrail projects into the width of the landing at the bottom of the stair, provides sufficiency of compliance with 9.8.4.2.(2), Sentence 9.8.4.1.(1), and 9.8.7.6.(1) of the Building Code at Unit #2, 175 Queen Street, Town of Niagara-on-the-Lake, Ontario.

Further, it is the Decision of the Building Code Commission that the door that swings outward over a 325 mm exterior step serving a second storey balcony does not provide sufficiency of compliance with Sentences 9.8.4.2.(1) of the Building Code at Unit #2, 175 Queen Street, Town of Niagara-on-the-Lake, Ontario.

Reasons

i) Sentence 9.8.4.2.(2) requires a landing to be provided at the top and bottom of each flight of interior stairs, except as provided in Sentence 9.8.4.2.(3). In the opinion of the Commission, the finished floor area at the bottom of the stairway shall be considered the landing.

ii) Sentence 9.8.3.3.(2) of the Code requires at least one stairway between floor levels in a dwelling unit to have a minimum width of 860 mm. Further, Sentence 9.8.4.1.(1) of the Code requires that landings shall be at least as wide and as long as the width of the stairs in which they occur. The width of landing and the width of stair when measured perpendicular to the run of the stair provides a minimum width of 860 mm as required by the Code.

iii) Sentence 9.8.7.6.(1) requires that handrails and constructions below handrails shall not project more than 100 mm into the required width of a stairway. The Commission was advised that the minimum required width for the stairway between the floor levels was not at issue.

iv) Sentence 9.8.4.2.(1) requires a door that swings towards a stair, the full arc of its swing shall be over a landing. It is the view of the Commission that the door, which swings outward over a 325 mm exterior step and onto a balcony, poses a safety hazard.

v) There were no acceptable compensating measures offered for the Commission to consider sufficiency of compliance with Sentence 9.8.4.2.(1).

Dated at Toronto this **23** day in the month of **August** in the year **2007** for application number **2007-24.**

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 3.2.5.1. of the Regulation 403/97, as amended, (the Building Code).

AND IN THE MATTER OF an application by Robert Mayhew, Southlake Regional Health Centre, for the resolution of a dispute with Ron Tremblay, Chief Building Official, Town of Newmarket, to determine whether the proposed compensating measures offered in lieu of the openings required by Article 3.2.5.1., when considering the provisions of Article 3.2.5.5., in a six storey, Group F, Division 3 storage garage, provide sufficiency of compliance with the Building Code at 596 Davis Drive, Town of Newmarket, Ontario.

APPLICANT	Robert Mayhew Southlake Regional Health Newmarket, ON
RESPONDENT	Ron Tremblay Chief Building Official Town of Newmarket
PANEL	Tony Chow, Chair Alison Churchill Prabhakar Mahant
PLACE	Toronto, Ontario
DATE OF HEARING	August 16, 2007
DATE OF RULING	August 16, 2007
APPEARANCES	Lind Nyman Parkin Architects Ltd. Toronto, ON **Agent for the Applicant** David Potter Assistant Director Town of Newmarket **Designate for the Respondent**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the proposed compensating measures offered in lieu of the openings required by Article 3.2.5.1., in a six storey, Group F, Division 3 storage garage, does not provide sufficiency of compliance with the Building Code at 596 Davis Drive, Town of Newmarket, Ontario.

Reasons

i) Sentence 3.2.2.10.(1) of the Building Code requires that every building shall face a street located in conformance with the requirements of Articles 3.2.5.5. and 3.2.5.6. In this instance, the west face of the subject building faces Prospect Street which serves as the required fire department access route.

ii) Article 3.2.5.1. of the Building Code requires that every storey, that is not sprinklered and whose floor level is less than 25 m above grade, be provided with direct access for fire fighting by at least one unobstructed window or access panel for each 15 m of wall in each wall required to face a street by Subsection 3.2.2. The subject building does not have an access panel every 15 m as required by Article 3.2.5.1.

iii) The compensating measures proposed, including the installation of sprinklers in the elevator lobbies, the provision of a fire alarm system and the increased fire resistance rating of the floor assemblies; do not offset the lack of direct access openings for fire fighting as required by Sentence 3.2.5.1.(1) of the Code.

AND IN THE MATTER OF Article 3.3.1.17. of Regulation 350/06, as amended, (the Building Code).

AND IN THE MATTER OF an application by Marvin Litvack, York Region Condominium Corporation No 6.22, for the resolution of a dispute with Leo Grellette, Chief Building Official, City of Vaughan, to determine whether the existing guards, serving exterior balconies of three residential units located within a 16 storey Group C residential condominium building, and being 1041 mm, 1032 mm and 930 mm in height respectively for Units 704, 1408, and 1702, provide sufficiency of compliance with Article 3.3.1.17. of the Building Code at 7460 Bathurst Street, City of Vaughan, Ontario.

APPLICANT	Marvin Litvack York Region Condominium Corporation No 6.22 City of Vaughan, ON
RESPONDENT	Leo Grellette Chief Building Official City of Vaughan, ON
PANEL	Leslie Morgan, Vice-Chair Rick Florio Marina Huissoon
PLACE	Toronto, Ontario
DATE OF HEARING	July 5, 2007
DATE OF RULING	July 5, 2007
APPEARANCES	Tom Bourdignon Andrejs Management Inc. Woodbridge, ON **Agent for the Applicant** Leo Grellette Chief Building Official City of Vaughan, ON **The Respondent**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the existing guards, serving exterior balconies of three residential units located within a 16 storey Group C residential condominium building, and being 1041 mm, 1032 mm and 930 mm in height respectively for Units 704, 1408, and 1702, does not provide sufficiency of compliance with Article 3.3.1.17. of the Building Code at 7460 Bathurst Street, City of Vaughan, Ontario.

Reasons

i) The repairs undertaken to refurbish the concrete cover of the balcony walking surfaces negatively impacted the height of the guard for the balconies. The Building Code establishes a minimum set of construction requirements, as set out in Article 3.3.1.17., requiring that a guard not less than 1070 mm (3 ft 6 in) high be provided for balconies where there is a difference of more than 600 mm between levels.

ii) In this instance, the repairs undertaken resulted in guard heights which are less than 1070 mm, which is the minimum height required by the Code. Moreover, the personal finishes (carpeting and decking) that have been added to the walking surface of the balconies by unit residents further exacerbates an already non-compliant condition. The Commission does not consider carpeting and decking that cover the entire walking surface of the balcony to be a removable furnishing, and is not like a chair, as argued by the applicant.

iii) Part 11 of the Building Code does not offer any compliance alternatives for guard heights in the subject 16 storey residential building.

iv) In the opinion of the Commission, the deviations from the minimum guard height of 1070 mm are beyond what could be considered within acceptable tolerance limits.

v) No compensating measures were offered to offset the lack of compliance with the minimum set of construction requirements prescribed the Code.

AND IN THE MATTER OF an application by Shirley Taliano, Homeowner, for the resolution of a dispute with Rolf Wiens Chief Building Official, Town of Niagara-on-the-Lake, to determine whether the as-installed 12 volt alarm system, consisting of smoke alarms and carbon monoxide detectors, where the smoke alarms, conforming to CAN/ULC-S553-02 and NFPA 72, are connected to a 30 watt siren located in the basement of a Group C residential dwelling, provides sufficiency of compliance with Articles 9.10.18.1., 9.10.18.3., 9.10.18.4., and 9.33.4.3. of the Building Code at 270 Niagara Boulevard, Town of Niagara-on-the-Lake, Ontario.

APPLICANT	Shirley Taliano Homeowner Niagara-on-the-Lake, ON
RESPONDENT	Rolf Wiens Chief Building Official Town of Niagara-on-the-Lake
PANEL	Leslie Morgan, Vice-Chair Rick Florio Marina Huissoon
PLACE	Toronto, Ontario
DATE OF HEARING	July 5, 2007
DATE OF RULING	July 5, 2007
APPEARANCES	Shirley Taliano Homeowner Niagara-on-the-Lake, ON **Agent for the Applicant** Keegan Gennings Building Inspector Town of Niagara-on-the-Lake **Designate for the Respondent**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the as-installed 12 volt alarm system, which includes smoke alarms on each level of the residence, carbon monoxide detectors, and a 30 watt siren (located in the basement) in a Group C residential dwelling provides sufficiency of compliance with Articles 9.10.18.3. and 9.10.18.4. of the Building Code at 270 Niagara Boulevard, Town of Niagara-on-the-Lake, Ontario, on condition that:

a) The sound pressure level in the sleeping rooms from the audible signal device(s) is not less than 75 dBA when any intervening doors between the device(s) and the sleeping rooms are closed.

Further, it is the Decision of the Building Code Commission that the smoke alarms and carbon monoxide detectors that have been installed do not provide sufficiency of compliance with Articles 9.10.8.1. and 9.33.4.3. of the Building Code at 270 Niagara Boulevard, Town of Niagara-on-the-Lake, Ontario.

Reasons

i) Article 9.10.18.4. of the Building Code sets out the requirements for interconnection of smoke alarms. Specifically, it stipulates that, when more than one smoke alarm is required in a dwelling unit, the smoke alarms are to be wired so that the activation of one alarm will cause alarms within the unit to sound. Adherence to the above noted condition will ensure that a sufficient sound pressure level is achieved throughout the building. Therefore, in the opinion of the Commission, the intent of the Building Code has been met regarding interconnection of smoke alarms, provided that it can be demonstrated that the alarm signal sound pressure level is not less than 75 dBA in the bedrooms, when any intervening doors between the device and the bedrooms are closed.

ii) The building is a single family dwelling unit of limited building area, which in the opinion of the Commission aids in allowing the transmission of sound from the alarm siren, which is interconnected to all smoke alarms and carbon monoxide detectors, to be audible throughout the entire dwelling.

iii) Article 9.10.18.3. of the Building Code sets out the requirements for power supply to smoke alarms. Sentence 9.10.18.3.(1) requires that smoke alarms be installed by permanent connections to an electrical circuit that has no disconnect switch between the overcurrent circuit device and the smoke alarm. The subject alarms are connected to, and derive their power from, the building security panel. The panel includes a power supply transformer which converts the building's 120 V supply to 12 V for the security/alarm panel. The alarm system is also equipped with a back up power supply, consisting of batteries designed to provide 4 hours of stand-by power plus 15 minutes of alarm. The Commission heard evidence which indicated that the subject alarm system has been installed and has passed the electrical inspection and that no issues were identified regarding the functionality of the system. The alarm system appears to meet the requirements of the Electrical Safety Code, therefore, in the opinion of the Commission, the as-installed system meets the intent of the Building Code for reliability of the system.

iv) Articles 9.10.18.1. and 9.33.4.3. of the Building Code set out the standards to which smoke alarms and carbon monoxide detectors must conform. The Commission was not presented with evidence to suggest that the alarm/detection devices installed conform to the standards listed within the Code for such devices nor was the Commission presented with evidence indicating to what standard the devices have been tested. It is the opinion of the Commission that sufficiency of compliance has not been achieved in this regard.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Parts 5 and 9 of Regulation 403, as amended, (the Building Code).

AND IN THE MATTER OF an application by Mika Jantunen, homeowner, for resolution of a dispute with Michael Diver, Chief Building Official, Township of Oro-Medonte to determine whether the proposed insulation system and wall assembly, composed of compressed, stacked straw bales, provides sufficiency of compliance with Parts 5 and 9 of the Building Code at 5745 3rd Line N, Township of Oro-Medonte, Ontario.

APPLICANT	Mika Jantunen Homeowner Barrie, Ontario
RESPONDENT	Michael Diver Chief Building Official Township of Oro-Medonte
PANEL	Tony Chow, Chair Gerry Egberts Neal Barkhurst
PLACE	Toronto, Ontario
DATE OF HEARING	June 7, 2007
DATE OF RULING	June 7, 2007
APPEARANCES	Mika Jantunen Homeowner Barrie, Ontario **The Applicant** Michael Diver Chief Building Official Township of Oro-Medonte **The Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for a permit under the *Building Code Act*, *1992*, to construct a two storey residential dwelling at 5745 3rd Line N, Township of Oro-Medonte, Ontario.

The subject dwelling, will have a building area of approximately 130 m^2, and will be constructed using combustible material. The floor of the first storey of the structure will be supported by slab on grade, as the dwelling will not include a basement level. The floor plan shows the dwelling to be rectangular in shape with the first storey containing the main living area, including kitchen, bathroom, living room and a bedroom. The second storey, containing an open concept loft, is only partially finished with the remainder of the area being open to the storey below. The roof of the dwelling projects 1.8 m beyond the north and south walls and 1.2 m beyond the gable ends (east and west walls) of the subject dwelling.

The dwelling will be framed using post and beam members for the structural integrity of the building. The exterior walls of the dwelling are proposed to be "filled in" with compressed, stacked straw bales between the structural post and beam members.

The proposed wall assembly will be constructed using compressed, stacked straw bales with a plastic polypropylene mesh installed on both the interior and exterior surface. The plastic mesh will be stitched to the straw bales using polypropylene twine. Three layers of stucco, a base coat, a scratch coat and a finish coat, will be applied directly to the plastic mesh on both the interior and exterior surfaces of the straw bales. The outermost coat will be smoothed to a finished texture. A coat of water based casein paint will be applied to the interior walls whereas the exterior surface of the straw bale assembly will include a water repellent paint on top of the three layers of stucco.

The issue at dispute between the parties involves whether the Applicant's proposal to use a compressed, stacked straw bale wall assembly in the construction of a new two storey, Group C – residential dwelling provides sufficiency of compliance with the Building Code. In particular, whether the proposed straw bale wall system will sufficiently comply with the provisions pertaining to environmental separators, such as thermal insulation, dampproofing, flashing, air barriers, vapour barriers and interior and exterior finishes.

2. Provisions of the Building Code in Dispute

Part 5 - Wind, Water and Vapour Protection

(Please see Part 5 of the Building Code)

Part 9 - Housing and Small Buildings

(Please see Part 9 of the Building Code)

3. Applicant's Position

At the commencement of the hearing, the Applicant submitted that he was unclear as to the technical provisions of the Code that were in dispute by the municipality. He claimed that his building permit has not been approved because the Chief Building Official is "not comfortable with straw bale construction". He further claimed that the municipality would only permit him to

construct a one storey building using straw bale construction provided that he complied with the conditions listed in a previous Building Code Commission ruling, issued in 1999 for a property in Mississauga. He maintained that he is unclear as to why the Chief Building Official would permit the use of straw bale as in-fill insulation in the construction of a one storey dwelling but not a two storey dwelling.

The Applicant stated that he has tried to address what he believes may be the provisions of the Code that are in dispute. He agreed that, as the use of straw bales is not prescribed by the Building Code, the building is required to be designed to Part 4 of the Code. He advised that he has engaged a professional engineer for the structural design of the building and therefore he believes that the building will be in conformance with Part 4 of the Building Code. He submitted that he believes that all other building systems and components will be in compliance with the respective provisions of Part 9 of the Code. He indicated that it his assumption that the main areas of concern regarding his proposed construction pertain to wind, water and vapour protection.

In this regard, the Applicant, with the assistance of his consultants, addressed the areas of Code pertaining to thermal insulation, dampproofing, flashing, air barriers, vapour barriers, exterior finishes and interior finishes.

The Applicant submitted that Section 9.13. of the Code outlines the provisions for dampproofing, however, he suggested that, as set out in Article 9.13.1.1., these provisions only apply to foundation walls below ground level of buildings. He further suggested that, since the proposed dwelling does not include a basement, dampproofing is not an issue. Similarly, he advised that the flashing installed on the subject dwelling will comply with Subsection 9.27.3. of the Code.

With respect to thermal insulation, the Applicant argued that, since the municipality would approve the use of straw bales as in-fill insulation for a one storey building, there is no difference in the thermal resistance value of straw bales used as insulation for a second storey. Further, he reported that the thermal resistance value attributed to compressed straw bales exceeds the minimum values required by the Building Code. He elaborated by saying that Table 9.25.2.1. of the Code requires a minimum thermal resistance of 3.00 RSI (R17) for the exterior walls of the subject dwelling. He declared that compressed straw bales provide a thermal resistance between 6.16 RSI (R35) and 7.04 RSI (R40), which not only exceeds the minimum requirements of the 1997 Building Code but also exceeds the minimum required by the 2006 Building Code.

The Applicant and his consultants addressed the Code requirements pertaining to air barriers, vapour barriers, exterior finishes and interior finishes. He maintained that a straw bale wall assembly, while not the same as a conventional wall assembly, provides an equivalent level of performance. He stated that layers of stucco and paint applied to the straw bales serve to provide the requisite air and vapour control outlined in the Building Code. He stressed that straw bale walls allow for a significant amount of safe moisture storage within the assembly.

It was the submission of the Applicant that the composition of the straw bale wall assembly, with the various finishes as described, meets the intent of the Building Code. He added that the roof projection of the dwelling provides additional protection for the exterior walls and will assist in preventing water from entering the wall assembly from the outside.

In summary, the Applicant reiterated that it is his belief that the proposed straw bale wall assembly will sufficiently comply with the intent of the prescriptive Part 9 requirements of the Building Code.

4. Respondent's Position

The Respondent submitted that straw bale construction, such as is proposed by the Applicant, is not prescribed in the Building Code. He further submitted that in reviewing the proposal he looked to a previous ruling of the Building Code Commission for guidance. As such, he indicated that he advised the Applicant that he would accept the proposed construction provided that the Applicant adhered to all of the conditions listed in the previous ruling. He pointed out that the subject proposal contemplates construction of a two storey dwelling and that the previous BCC ruling included a condition that limited the construction to a one storey building.

In response to questions regarding which specific provisions of the Building Code were in dispute, the Respondent advised that the issues in dispute pertained to environmental separators. He confirmed that there was no issue regarding structural integrity of the building as the structure has been designed by a professional engineer in accordance with Part 4 of the Building Code.

The Respondent indicated that the Building Code does not address the use of straw bale construction and he was unable to accept the proposal as providing an equivalent level of performance as would be achieved by complying with the prescriptive requirements of the Code. He stressed that he is particularly concerned with protection against wind, water and vapour especially for the second storey of the dwelling.

In summation, the Respondent reiterated that as the Code does not address straw bale construction, he looked to the previous ruling of the Commission for guidance. He indicated that, as the Applicant would not agree to abide by the conditions associated with the previous ruling, he was unable to accept the proposal as, in his opinion, the proposal does not comply with the Building Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposed insulation system and wall assembly composed of compressed, stacked straw bales provides sufficiency of compliance with Parts 5 and 9 of the Building Code at 5745 3rd Line N., Township of Oro-Medonte, Ontario, on condition that:

a) A professional engineer, registered in the Province of Ontario, who has expertise in building science and in straw bale construction, shall provide his or her professional stamp on the drawings and details provided to the municipality and he or she shall oversee the construction of the subject building.

b) The stucco finish applied to the exterior of the subject building shall be not less than 200 mm (7⅞ inches) above finished ground level.

c) The flashing installed for the subject building shall comply with the requirements outlined in Subsection 9.27.3. of the Building Code.

d) The caulking provided for the subject building shall comply with requirements outlined in Subsection 9.27.4. of the Building Code.

e) The stucco used for the subject building shall comply with the requirements outlined in Subsection 9.28. of the Building Code, with the exception of Article 9.28.4.1., whereby, a 44 x 49 mm plastic polypropylene mesh (known as Cintoflex C) may be used as stucco lath for the subject building.

6. Reasons

i) The proposed straw bale wall assembly is being used as an insulation system only. The straw bale wall assembly is not being used to structurally support the subject building. Furthermore, the Commission heard evidence at the hearing that the municipality did not have an issue with respect to structural adequacy of the subject building as the drawings submitted had been stamped by a professional engineer licensed in the Province of Ontario.

ii) Based on evidence presented at the hearing and the condition requiring a review by a professional engineer having expertise in building science, the Commission is satisfied that sufficiency of compliance with the requirements outlined in Part 5 of the Building Code will be achieved.

iii) The Commission notes that the municipality would have accepted the proposed use of straw bale construction based upon a previous ruling and conditions issued by the Building Code Commission. However, in this instance the Applicant's proposal included, among other things, using straw bale construction of a second storey and using an alternative to wire mesh as stucco lath. Based on the evidence heard by the Commission regarding the design of the proposed building on the subjects of thermal insulation, dampproofing, flashing, air barriers, vapour barriers, interior and exterior finishes, the Commission is satisfied that the construction proposed will meet the intent of the Building Code in respect to these requirements.

iv) The Commission heard evidence indicating that the thermal resistance values attributed to the compressed straw bales exceed the minimum thermal resistance values outlined in the Building Code.

v) In the opinion of the Commission, the roof projection of the subject dwelling provides sufficient overhang so as to provide protection to the first and second storeys of the dwelling.

AND IN THE MATTER OF Articles 3.1.8.3., 3.2.3.6., 3.3.5.6., Sentences 3.2.5.16.(2) and 3.3.4.2.(4) of the Regulation 403/97,as amended, (the Building Code).

AND IN THE MATTER OF an application by Randy Wilson, Randy Wilson Architect Inc., for the resolution of a dispute with Rocky Cerminara, City of London, to determine whether the proposed construction of a Group B, Division 3 care occupancy, where the proximity of the nearest fire hydrant is approximately 90 m from the building, the fire resistance rating of the fire separation between the single car storage garage and the remainder of the building is less than 1. 5 h, combustible eave projections will extend to within 1.2 m from the property line and where the fire separation does not extend to the underside of the roof deck, provides sufficiency of compliance with Articles 3.1.8.3., 3.2.3.6., 3.3.5.6., Sentences 3.2.5.16.(2) and 3.3.4.2.(4) of the Building Code at 586 Creston Avenue, City of London, Ontario.

APPLICANT	Randy Wilson Randy Wilson Architect London, ON
RESPONDENT	Rocky Cerminara Chief Building Official City of London
PANEL	Tony Chow, Chair Gerry Egberts Neal Barkhurst
PLACE	Toronto, Ontario
DATE OF HEARING	June 7, 2007
DATE OF RULING	June 7, 2007
APPEARANCES	Gary Edwards Code Advisor Ilderton, ON **Agent for the Applicant** Doug Thatcher Building Inspector City of London **Agent for the Respondent**

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the proposed construction of a Group B, Division 3 care occupancy, where the proximity of the nearest fire hydrant is greater than 45 m but less than 90 m from the building provides sufficiency of compliance with Sentence 3.2.5.16.(2) of the Building Code at 586 Creston Avenue, City of London, Ontario, on condition that:

a) The fire alarm system that has been installed shall be connected to a monitoring system so that the fire department is notified in the event of an alarm signal being initiated.

Further, it is the Decision of the Building Code Commission that the combustible eave projections that will extend to less than 1.2 m from the property line and the vertical fire separation, between the garage and the Group B, Division 3 occupancy, that does not extend to the underside of the roof deck, do not provide sufficiency of compliance with Articles 3.1.8.3., 3.2.3.6., and Sentence 3.3.4.2.(4) of the Building Code at 586 Creston Avenue, City of London, Ontario.

Reasons

i) The subject building is reasonably small in size and the fire station is relatively close in proximity to the subject building. Additionally, the building will have 24 hour, on-site supervision and with adherence to the above noted condition, the fire alarm system will be connected to an external monitoring system. Furthermore, if the subject building were less than 186 m^2 in size, a connection to the fire department would not be required. In the opinion of the Commission sufficiency of compliance with the requirements of the Building Code will be achieved.

ii) It is the opinion of the Commission that the level of protection offered by the proposed non-combustible, perforated soffit cladding and the additional fire stopping are not effective means to prevent migration of a fire into the attic space and therefore sufficiency of compliance would not be achieved.

iii) Article 3.3.5.6. of the Building Code requires a storage garage to be separated from other occupancies by a fire separation having a fire resistance rating of not less than 1.5 h. The Commission heard evidence that the walls between the garage and the care occupancy of the subject building provide the requisite 1.5 h fire resistance rating. However, this vertical fire separation does not extend to the underside of the roof deck as required by Article 3.1.8.3. of the Code. The Commission is not satisfied that the proposal to provide a horizontal 1 h ceiling membrane on the garage side only will adequately address the lack of continuity of the fire separation and therefore, sufficiency of compliance would not be achieved.

RULING

1. Particulars of Dispute

The Applicant applied for a permit under subsection 8(1) of the Act to construct a one storey, five unit townhouse block at 26 Bluegrass Crescent, City of St. Catharines, Ontario.

The dispute between the parties involves whether the Chief Building Official (the Respondent) complied with subsections 8(2.2) and 8(2.3) of the Act and Division C, Sentence 1.3.1.3.(1) of the Building Code.

2. Provisions of the Act and Building Code in Dispute

Act: subsections 8(2.2) and (2.3)

Decision

(2.2) When an application for a permit contains the prescribed information, the chief building official is required to determine within the period prescribed by regulation whether to issue the permit or to refuse to issue it.

Same, reasons for refusal

(2.3) If the chief building official refuses to issue the permit, he or she shall inform the applicant of all of the reasons for the refusal of the permit and shall do so within the period prescribed by regulation.

Building Code:

Division C, Article 1.3.1.3. Period Within Which a Permit is Issued or Refused

(1) Subject to Sentences (2) and (3), if an application for a permit under subsection 8 (1) of the Act that meets the requirements of Sentence (5) is submitted to a *chief building official*, the *chief building official* shall, within the time period set out in Column 3 of Table 1.3.1.3. corresponding to the class of *building* described in Column 2 of Table 1.3.1.3. for which the application is made,

(a) issue the permit, or

(b) refuse to issue the permit and provide in writing all of the reasons for the refusal.

Table 1.3.1.3.
Period Within Which Permit Shall be Issued or Refused

Forming Part of Article 1.3.1.3.

Column 1	Column 2	Column 3
Row Number	Class of *Building*	Time Period
1	(a) A detached house, semi-detached house, townhouse, or row house where no *dwelling unit* is located above another *dwelling unit*. (b) A detached structure that serves a *building* described in Clause (a) and does not exceed 50 m^2 in *building area*. (c) A tent to which Section 3.14. of Division B applies. (d) A sign to which Section 3.15. of Division B applies.	10 days
2	(a) *Buildings* described in Clause 1.1.2.4.(1)(a), (b) or (c) of Division A, other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* that do not exceed 600 m^2 in *building area*.	15 days
3	(a) *Buildings* described in Clause 1.1.2.2.(1)(a), or (b) of Division A, other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* exceeding 600 m^2 in *building area*.	20 days
4	(a) *Post-disaster buildings*. (b) *Buildings* to which Subsection 3.2.6. of Division B or any provision in Articles 3.2.8.3. to 3.2.8.11. of Division B applies.	30 days

3. Applicant's Position

The Applicant stated that, on April 25, 2007, a permit application was submitted to the City of St. Catharines Building Department along with a cheque for the payment of the fees required to be paid when a permit application is made. He advised that the permit application proposed the construction of a one storey, five unit townhouse block at 26 Bluegrass Crescent. In his Application for Hearing to the Building Code Commission, he submitted that the Respondent neither issued the permit nor refused to issue the permit and provide all reasons for the refusal within the prescribed time frame.

The Applicant advised that on April 30, 2007, he received a letter from the Chief Building Official stating that an initial review of the permit application revealed that the requisite Ministry of Transportation (MTO) permit expired on April 19, 2007. He further advised that this letter indicated that since the MTO permit had expired, the building permit application was being considered incomplete by the municipality and that the time frame for reviewing the permit application would not commence until such time as a current MTO permit was provided.

The Applicant stated that a call was placed to MTO requesting clarification regarding the effective date of the MTO permit. He added that a representative of MTO was requested to contact the Chief Building Official in order to clarify issues regarding the expiration of MTO permits. He reported that it is his understanding that a representative of MTO spoke with the municipality to clarify these issues. He further reported that MTO considers "construction" to be started on a site when grading or site servicing has begun. He added that grading and servicing of this block has already begun and therefore the MTO permit should be considered a valid permit.

The Applicant explained that on May 9, 2007, an employee of Ravenda Homes Ltd. went to the City's offices to pick up the anticipated building permit. It was then that a letter, dated May 2, 2007, detailing the reasons the City was unable to issue the building permit was handed to him. The Applicant denied having received a copy of the May 2, 2007 letter of refusal prior to the copy that was hand delivered to his employee on May 9, 2007.

The Applicant asserted that the City of St. Catharines has not upheld the spirit of the Building Code in respect of the prescribed time frames for issuing building permits. He contended that the City of St. Catharines is abusing its power and he further contended that he is being treated unfairly by the City.

The Applicant stated that the reasons for not issuing his building permit are unreasonable and that it is inexcusable that the City waited until the very last minute to advise him that the permit was not going to be issued. He reiterated that prior to May 9, 2007 he did not receive any communication from the City regarding his permit other than the April 30, 2007 letter regarding the MTO issue.

In summary, the Applicant argued that City of St. Catharines is not meeting the intent or spirit of the Building Code in respect of the time frame provisions for permit processing and that he and his company are being unfairly treated by the City.

4. Respondent's Position

The Respondent participated in the hearing by way of teleconference and submitted that a permit application from the Applicant was received on April 25, 2007. She confirmed that the application included the required fees and that the permit application was subject to the ten day time period outlined in Table 1.3.1.3. of the Code. She affirmed that, in accordance with Division C, Sentence 1.3.1.3.(6) of the Code, the time period for making a determination regarding the issuance of a building permit began on April 26, 2007.

With respect to the issues regarding the expiration of the MTO permits, the Respondent advised that she spoke with a representative of MTO seeking clarification of the expiration dates of the MTO permits. She reported that after receiving clarification that MTO considers "construction" to be started on a site if grading or site servicing has commenced and she proceeded to process the permit application review based on the original date of submission. She explained that a letter, dated May 7, 2007, was sent to the Applicant confirming this and advising that the permit application would be processed accordingly.

The Respondent reported that the permit application was reviewed almost immediately and it became apparent the City would be unable to issue the building permit. She advised that a letter, dated May 2, 2007, detailing the reasons for refusal to issue the building permit was mailed to the Applicant on May 3, 2007. She asserted that the municipality has met its obligation with respect to the legislated time frame for processing permit applications. When questioned as to whether the letter of refusal had been faxed to the Applicant, the Respondent disclosed that the letter was sent by regular mail only. However, she added, a copy of the May 2, 2007 letter of refusal was hand delivered to an agent of Ravenda Homes Ltd. on May 9, 2007.

In summation, the Respondent asserted that the City of St. Catharines has met its obligation with respect to the legislated time frame with respect to permit processing in this instance. She reiterated that the time period for making a determination regarding the Applicant's building permit application began on April 26, 2007. She declared that the Code specifies that the time period does not include Saturdays, holidays and all other days that the offices are not open for business, therefore, the applicable time period, in this instance, ended on May 9, 2007. She asserted that the letter detailing reasons for non-issuance of the building permit was sent to the Applicant via regular mail on May 3, 2007 and, as such, the municipality has fully complied with the time frames prescribed by the Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the Respondent has complied with the requirements of Subsections 8(2.2) and 8(2.3) of the *Building Code Act, 1992* and Division C, Sentence 1.3.1.3.(1) of the Building Code. Under these subsections, the Respondent is required to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal, within the applicable time period set out in Table 1.3.1.3. of the Building Code.

6. Reasons

i) Division C, Sentence 1.3.1.3.(6) of Division C of the Building Code specifies when the time periods set out in Table 1.3.1.3. commence:

The time period described in Sentences (1) to (3) shall begin on the day following the later of

(a) the day on which an application meeting the requirements of Sentence (5) is submitted to the chief building official, and

(b) the day on which payment is made of all fees that are required, under a by-law, regulation or resolution made under Clause 7 (1) (c) of the Act, to be paid when the application is made.

The parties agreed that the permit applications were submitted to the City of St. Catharines on April 25, 2007.

As a result, it is April 26, 2007 (the day following the day on which an application meeting the requirements of Sentence (5) is submitted) that the applicable time period set out in Table 1.3.1.3. commenced in this case.

ii) The parties agreed that the construction proposed under the application in question is subject to the ten day time period set out in Column 3 of Row 1 in Table 1.3.1.3. Sentence 1.3.1.3.(7) provides that the time periods described in Column 3 of Table 1.3.1.3. do not include Saturdays, holidays and all other days when the offices of a principal authority are not open for the transaction of business with the public.

In the present case, the applicable ten day time period ended on May 9, 2007. The Respondent was required to issue or refuse to issue permits in respect of the Applicant's permit applications by that date.

iii) The Respondent hand delivered a letter, dated May 2, 2007, which detailed the reasons for refusing to issue the building permit to an employee of Ravenda Homes Ltd. on May 9, 2007. It is the opinion of the Commission, that the Respondent met its obligation with respect to the requirements of Division C, Article 1.3.1.3. of the Building Code.

The Respondent submitted that the letter detailing the reasons for not issuing the building permit was mailed to the Applicant on May 3, 2007. The Applicant submitted that this letter was not received by him until approximately 4:30 p.m. on May 9, 2007, when it was hand delivered to an employee of Ravenda Homes Ltd.

iii) The Commission notes that neither the Building Code nor the *Building Code Act, 1992* makes reference to a specific time of day by which the Respondent must inform the Applicant of its decision to issue or refuse to issue a building permit. Subsection

8(2.3) of the *Building Code Act* simply states that if the Chief Building Official refused to issue the permit, he or she inform the applicant of all of the reasons for the refusal of the permit and shall do so within the period prescribed by regulation.

iv) Division C, Sentence 1.3.1.3.(1) of the Code requires the Chief Building Official to, within ten days of receipt of a building permit application meeting the requirements of Sentence 1.3.1.3.(5) of the Code, either issue the permit or provide all written reasons as to why the permit cannot be issued (emphasis added).

Under Subsection 8(2) of the *Building Code Act, 1992*, a Chief Building Official shall issue a permit unless certain reasons prevent him/her from doing so. In this instance, the Respondent, within the prescribed ten day time frame, identified reasons for refusal of the permit and informed the Applicant of those reasons, thereby complying with Subsection 8(2.3) of the *Building Code Act, 1992.*

The Commission does not have the authority to make a determination on the validity, legality or reasonableness of the reasons for refusal of a permit identified by the municipality.

RULING

1. Particulars of Dispute

The Applicant applied for a permit under subsection 8(1) of the Act to construct a one storey, seven unit townhouse block at 19 Bluegrass Crescent, City of St. Catharines, Ontario.

The dispute between the parties involves whether the Chief Building Official (the Respondent) complied with subsections 8(2.2) and 8(2.3) of the Act and Division C, Sentence 1.3.1.3.(1) of the Building Code.

Pursuant to Division C, Article 2.2.1.3. of the Building Code, the Building Code Commission convened a hearing within five days of receipt of this application. On the day of hearing, the Applicant requested an adjournment to attend to an urgent personal matter. After having received consent to adjourn the hearing from the Respondent, the Commission granted the request for adjournment and agreed to reschedule the hearing to the earliest, mutually convenient date.

2. Provisions of the Act and Building Code in Dispute

Act: subsections 8(2.2) and (2.3)

Decision

(2.2) When an application for a permit contains the prescribed information, the chief building official is required to determine within the period prescribed by regulation whether to issue the permit or to refuse to issue it.

Same, reasons for refusal

(2.3) If the chief building official refuses to issue the permit, he or she shall inform the applicant of all of the reasons for the refusal of the permit and shall do so within the period prescribed by regulation.

Building Code:

Division C, Article 1.3.1.3. Period Within Which a Permit is Issued or Refused

(1) Subject to Sentences (2) and (3), if an application for a permit under subsection 8 (1) of the Act that meets the requirements of Sentence (5) is submitted to a *chief building official*, the *chief building official* shall, within the time period set out in Column 3 of Table 1.3.1.3. corresponding to the class of *building* described in Column 2 of Table 1.3.1.3. for which the application is made,

(a) issue the permit, or

(b) refuse to issue the permit and provide in writing all of the reasons for the refusal.

Table 1.3.1.3.
Period Within Which Permit Shall be Issued or Refused

Forming Part of Article 1.3.1.3.

Column 1	Column 2	Column 3
Row Number	Class of *Building*	Time Period
1	(a) A detached house, semi-detached house, townhouse, or row house where no *dwelling unit* is located above another *dwelling unit*. (b) A detached structure that serves a *building* described in Clause (a) and does not exceed 50 m^2 in *building area*. (c) A tent to which Section 3.14. of Division B applies. (d) A sign to which Section 3.15. of Division B applies.	10 days
2	(a) *Buildings* described in Clause 1.1.2.4.(1)(a), (b) or (c) of Division A, other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* that do not exceed 600 m^2 in *building area*.	15 days
3	(a) *Buildings* described in Clause 1.1.2.2.(1)(a), or (b) of Division A, other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* exceeding 600 m^2 in *building area*.	20 days
4	(a) *Post-disaster buildings*. (b) *Buildings* to which Subsection 3.2.6. of Division B or any provision in Articles 3.2.8.3. to 3.2.8.11. of Division B applies.	30 days

3. Applicant's Position

The Applicant stated that, on April 3, 2007, a permit application was submitted to the City of St. Catharines Building Department along with a cheque for the payment of the fees required to be paid when a permit application is made. He advised that the permit application proposed the construction of a one storey, seven unit townhouse block at 19 Bluegrass Crescent. In his Application for Hearing to the Building Code Commission, he submitted that the Respondent neither issued the permit nor refused to issue the permit and provide all reasons for the refusal within the prescribed time frame.

The Applicant advised that the municipality initially expressed some concern regarding the expiration of the requisite Ministry of Transportation (MTO) permit. He further advised that after discussion with the Ministry of Transportation and the City of St. Catharines, the issue regarding the MTO permit was resolved as the City accepted May 5, 2007 as being the expiry date of the MTO permit.

The Applicant acknowledged that, at 4:06 p.m. on April 18, 2007, a faxed letter was received which detailed the reasons the City was unable to issue the building permit. He noted, however, that his office was closed for business and therefore, he did not, in fact, receive the letter of refusal until the following day. He asserted that the City of St. Catharines has not upheld the spirit of the Building Code in respect of the prescribed time frames for issuing building permits. It was his contention that the City ought to have brought the issues outlined in the April 18, 2007 letter to his attention before the "eleventh hour on the tenth day". The permit, he stated, should be issued within ten days.

In summary, the Applicant argued that City of St. Catharines is not meeting the intent or spirit of the Building Code in respect of the time frame provisions for permit processing and staff are abusing their powers under the *Building Code Act.* He reiterated that it is his belief that the City has not met its obligation with respect to the legislated permit processing time frames for this permit application.

4. Respondent's Position

The Respondent participated in the hearing by way of teleconference and submitted that a permit application from the Applicant was received on April 3, 2007. She confirmed that the application included the required fees and that the permit application was subject to the ten day time period outlined in Table 1.3.1.3. of the Code. She affirmed that, in accordance with Division C, Sentence 1.3.1.3.(6) of the Code, the time period for making a determination regarding the issuance of a building permit began on April 4, 2007.

The Respondent claimed that the MTO permit was not included with the application for permit but conceded that, on April 18, 2007, the MTO permit, dated November 3, 2006, was hand delivered to the City's offices. She reported that, upon receipt of the MTO permit, it was noted that the expiry date on the MTO permit read April 19, 2007. She went on to say that after a discussion with the Applicant it was agreed that, since there was a statement on the MTO permit reading "Construction must be started within six (6) months of date of issue or this permit shall be void", May 3, 2007 would be the date of expiry for the MTO permit.

The Respondent maintained that the review of the permit application was completed on April 18, 2007. She advised that a letter outlining the reasons for refusing to issue the building permit was faxed to the Applicant, just after 4:00 p.m., on April 18, 2007.

In summation, the Respondent asserted that the City of St. Catharines has met its obligation with respect to the legislated time frame for permit processing in this instance. She reiterated that the time period for making a determination regarding the Applicant's building permit application began on April 4, 2007. She declared that the Code specifies that the time period does not include Saturdays, holidays and all other days that the offices are not open for business, therefore, the applicable time period, in this instance, ended on April 18, 2007 (municipal offices were not open for business on April 16, 2007 – Good Friday). She asserted that the letter detailing reasons for non-issuance of the building permit was sent to the Applicant via fax on April 18, 2007 and, as such, the municipality has fully complied with the time frames prescribed by the Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the Respondent has complied with the requirements of Subsections 8(2.2) and 8(2.3) of the *Building Code Act, 1992* and Division C, Sentence 1.3.1.3.(1) of the Building Code. Under these subsections, the Respondent is required to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal, within the applicable time period set out in Table 1.3.1.3. of the Building Code.

6. Reasons

i) Division C, Sentence 1.3.1.3.(6) of Division C of the Building Code specifies when the time periods set out in Table 1.3.1.3. commence:

The time period described in Sentences (1) to (3) shall begin on the day following the later of

(a) the day on which an application meeting the requirements of Sentence (5) is submitted to the chief building official, and

(b) the day on which payment is made of all fees that are required, under a by-law, regulation or resolution made under Clause 7 (1) (c) of the Act, to be paid when the application is made.

The parties agreed that the permit applications were submitted to the City of St. Catharines on April 3, 2007. As a result, it is April 4, 2007 (the day following the day on which an application meeting the requirements of Sentence (5) is submitted) that the applicable time period set out in Table 1.3.1.3. commenced in this case.

ii) The parties agreed that the construction proposed under the application in question is subject to the ten day time period set out in Column 3 of Row 1 in Table 1.3.1.3. of Division C. Sentence 1.3.1.3.(7) provides that the time periods described in Column 3 of Table 1.3.1.3. do not include Saturdays, holidays and all other days when the offices of a principal authority are not open for the transaction of business with the public.

In the present case, the applicable ten day time period ended on April 18, 2007. The Respondent was required to issue or refuse to issue a permit in respect of the Applicant's permit application by that date.

iii) On April 18, 2007, the Respondent faxed a letter to the Applicant which detailed the reasons for refusing to issue the building permit. It is the opinion of the Commission, that the Respondent met its obligation with respect to the requirements of Division C, Article 1.3.1.3. of the Building Code. The Commission notes that neither the Building Code nor the *Building Code Act, 1992* makes reference to a specific time of day by which the Respondent must inform the Application of its decision to issue or refuse to issue a building permit. Subsection 8(2.3) of the *Building Code Act, 1992* simply states that if the Chief Building Official refused to issue the permit, he or she is to inform the applicant, in writing, of all of the reasons for the refusal of the permit and shall do so within the period prescribed by regulation.

iv) Division C, Sentence 1.3.1.3.(1) of the Code requires the Chief Building Official to, within ten days of receipt of a building permit application meeting the requirements of Sentence 1.3.1.3.(5) of the Code, either issue the permit or provide all written reasons as to why the permit cannot be issued (emphasis added). In this instance, the Respondent, within the prescribed ten day time frame, identified reasons for refusal of the permit and informed the Applicant of those reasons, thereby complying with Subsection 8(2.3) of the *Building Code Act, 1992.*

The Commission does not have the authority to make a determination on the validity, legality or reasonableness of the reasons for refusal of a permit identified by the municipality.

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the proposed construction of a running track, which will be suspended from the roof trusses above the gymnasium of a Group A, Division 2 occupancy, where no fire resistance rating will be provided for the supporting tension rods, the roof trusses or the running track floor assembly does not provide sufficiency of compliance with Clauses 3.2.2.24.(2)(b) and 3.2.2.24.(2)(c) of the Building Code at the Athletic, Fitness & Health Centre for Durham College/UOIT, 21 Avenue of Champions, City of Oshawa, Ontario.

Reasons

i) In the opinion of the Commission, the track level is an intermediate floor assembly between the floor and ceiling of the gymnasium and is, therefore, considered to be a "mezzanine" as defined by the Code. This floor area, in the opinion of the Commission, is not comparable to a walkway between buildings. Furthermore, in the opinion of the Commission the intended use of the running track constitutes an "occupancy". Clauses 3.2.2.24.(2)(b) and (c) require that the mezzanine and its supporting structure be provided with a fire resistance rating of not less than 1 hour in this instance.

ii) The exits provided from the running track level to the exterior of the building would be required in order to meet the travel distance requirements prescribed by the Code. Therefore, the Commission does not consider that feature to be a compensating measure. Furthermore, the Commission notes that the exits from the gymnasium floor are situated beneath the running track mezzanine and, as such, the access to these exits could be compromised in the event of the collapse of the running track if not adequately protected.

iii) The bleachers for the gymnasium are located below the track and in the opinion of the Commission provide a significant fuel load.

iv) Article 3.2.2.17. allows the requirements for roof assemblies to have a fire resistance ratings to be waived provided the building is equipped with an electrically supervised sprinkler system. As such, the sprinkler system, despite the increase in water density noted by the Applicant, is a Code requirement and is not considered to be sufficient compensation for the lack of fire resistance rating for the mezzanine and supporting structure.

v) The proposed compensating features, specifically increased sprinkler density, provision of smoke detectors under the mezzanine, and signage regarding the restriction of access to the running track when the gymnasium is used for convocation or concert purposes, in the opinion of the Commission, do not provide sufficient compensation to waive the requirements for fire resistance rating of the mezzanine and supporting structure.

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the design of a proposed pool, which will be surrounded on three sides only by a hard-surfaced pool deck, in a 6 storey mixed use building, provides sufficiency of compliance with Sentence 3.11.3.1.(9) of the Building Code at Amica at Westboro Park, 491 Richmond Road, City of Ottawa, Ontario, on condition that:

a) A hand grip (e.g., rail or recessed grip) shall be provided just above the water level along the side of the pool where no deck is provided, including above the integral seating.

b) Two life rings and two rescue poles shall be provided in the pool area.

Reasons

i) The subject pool is approximately 50 m^2 in area and has a depth of approximately 1.2 m at its deepest point. In the opinion of the Commission, the performance level of this small, shallow pool, with a hard-surfaced pool deck on three sides only, is not significantly different from the performance level of the shallow end of a conventional size pool, with access from a hard-surfaced pool deck on three sides, with the fourth side bounded by a deep end.

ii) It is the opinion of the Commission, that the proposed design of the subject pool meets the intent of the Code with respect to facilitating emergency response to persons in distress. Access to the far side of the subject pool, having a pool deck on three sides only, is comparable to access to the centre of a larger conventional pool with a pool deck on all four sides. In addition, the shallow depth of the subject pool facilitates self-rescue and the stepped entrance to the pool provides enhanced emergency egress from the pool when compared to the conventional pool ladder.

iii) Access to the subject pool area is through the “wellness centre”, and the Commission heard evidence indicating that the wellness centre is always staffed when in operation. Furthermore, the Commission heard evidence that residents of the Group B, Division 3 occupancy would be accompanied by an escort when accessing the pool area.

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the proposal to install a Class 5 sewage system to serve a one and a half storey visitor centre and office provides sufficiency of compliance with Article 8.8.1.2. of the Building Code at Glengarry Pioneer Museum, 1645 County Road 30, Township of North Glengarry, Ontario, on condition that:

a) In addition to the Building Code requirements for installation of a Class 5 sewage system, the access extension from the holding tank to grade shall be permanently water-tight and frost resistant.

b) An engineer shall certify that the proper hold-down procedures to avoid buoyancy have been followed.

Reasons

i) The Glengarry Pioneer Museum is a historical facility that is unique in its use, site, operation and geological conditions, which include a high watertable and the potential for flooding.

ii) While the Commission acknowledges the municipality's position that the installation of a Class 5 sewage system is prohibited by the Building Code, the Commission is satisfied that, as a result of the combination of unique site features, including operation of the museum and the site's high watertable and potential for flooding, the installation of a Class 5 sewage system is appropriate for the preservation of this heritage site and sufficiency of compliance with the code, in this instance, will be achieved.

iii) The museum will continue to provide portable washroom facilities to the public.

iv) The number of plumbing fixtures that will be served by the Class 5 sewage system is relatively low. The washroom facilities that will be served by the Class 5 sewage system are for the use of employees and physically disabled patrons only.

v) The Glengarry Pioneer Museum is primarily a seasonal operation that is only open to the public between May and September.

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the work undertaken, consisting of raising the tile bed and replacing existing fill and natural mantle, on an existing Class 4 sewage system does not provide sufficiency of compliance with Clause 8.7.3.2.(1)(e) of the Building Code at 3034 Navan Road, City of Ottawa, Ontario.

Reasons

i) In the opinion of the Commission the work undertaken constitutes the replacement of an existing sewage system. Therefore, Sentence 11.3.1.2.(1) of the Building Code applies. Sentence 11.3.1.2.(1) requires that the design and construction of the sewage system comply with Part 8 of the Code.

ii) The as-constructed sewage system does not provide sufficiency of compliance with the requirements of the Part 8 of the Code. The Commission heard evidence to suggest that the bed does not provide the requisite 900 mm separation from the watertable. Further, no mantle has been constructed while the Code requires a mantle in this instance.

RULING

Commission Ruling

It is the Decision of the Building Code Commission that the proposal to omit a barrier-free path of travel to the kitchen, service stations and cash counter areas in a one storey, Group A, Division 2 occupancy does not provide sufficiency of compliance with Articles 3.8.1.3. and 3.8.2.1. of the Building Code at Cora's Breakfast and Lunch, 561 Hespeler Road, Unit 15, City of Cambridge, Ontario.

Reasons

i) Sentence 3.8.1.3.(1) states that a barrier-free path of travel shall provide an unobstructed width of at least 1 060 mm for the passage of wheelchairs. Further, Sentence 3.8.2.1.(1) of the Building Code requires that a barrier-free path of travel be provided throughout the entrance storey and within all normally occupied floor areas.

ii) Sentence 3.8.2.1.(1) provides an exception where essential obstructions in the work area would make a barrier-free path of travel hazardous. It is the opinion of the Commission, that the kitchen, service stations and cash counter areas do not have essential obstructions which would make a barrier-free path of travel hazardous.

iii) Sentence 3.8.2.1.(2), and 3.8.2.1.(3) exempts certain areas from being provided with a barrier-free path of travel. In the opinion of the Commission, the kitchen, service stations and cash counter areas of the subject building are not included in the listed exceptions outlined in Sentences 3.8.2.1.(2), and 3.8.2.1.(3).

iv) While the Commission recognizes that the areas in question are not "public" areas, the intent of the Code is to provide a path of travel that will not unduly impede access to all normally occupied floor areas. It is conceivable that persons, other than the general public, e.g. an employee or inspector may require access to the areas subject to this dispute.

RULING

1. Particulars of Dispute

The Applicant applied for a permit under subsection 8(1) of the Act to construct seven (7) individual Class 4 sewage systems to service seven (7) residential dwellings at 16006 Niagara River Parkway (Lots 1-7, Plan 327), Town of Niagara-on-the-Lake, Ontario.

The dispute between the parties involves whether the Medical Officer of Health (the Respondent) complied with subsections 8(2.2) and 8(2.3) of the Act and Sentence 2.4.1.1B.(1) when considering the provisions of Sentence 2.4.1.1B.(5) of the Building Code.

2. Provisions of the Act and Building Code in Dispute

Act: subsections 8(2.2) and (2.3)

Decision

(2.2) When an application for a permit contains the prescribed information, the chief building official is required to determine within the period prescribed by regulation whether to issue the permit or to refuse to issue it.

Same, reasons for refusal

(2.3) If the chief building official refuses to issue the permit, he or she shall inform the applicant of all of the reasons for the refusal of the permit and shall do so within the period prescribed by regulation.

Building Code:

2.4.1.1B. Period Within Which a Permit is Issued or Refused

(1) Subject to Sentences (2) and (3), if an application for a permit under Subsection 8 (1) of the Act that meets the requirements of Sentence (5) is submitted after December 31, 2005 to a *chief building official*, the *chief building official* shall, within the time period set out in Column 3 of Table 2.4.1.1B. corresponding to the class of *building* described in Column 2 of Table 2.4.1.1B. for which the application is made:

(a) issue the permit, or

(b) refuse to issue the permit and provide in writing all of the reasons for the refusal.

TABLE 2.4.1.1B.

Period Within Which Permit Shall be Issued or Refused Forming Part of Article 2.4.1.1B.

Row Number	Class of *Building*	Time period
1	(a) A detached house, semi-detached house, townhouse, or row house where no *dwelling unit* is located above another *dwelling unit.* (b) A detached structure that serves a *building* described in Clause (a) and does not exceed 50 m^2 in *building area*. (c) A tent to which Section 3.13. applies. (d) A sign to which Section 3.14. applies.	10 days
2	(a) *Buildings* described in Clauses 2.1.1.3.(1)(a), (b) and (c), other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* that do not exceed 600 m^2 in *building area*.	15 days
3	(a) *Buildings* described in Clause 2.1.1.2.(1)(a) or (b), other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* exceeding 600 m^2 in *building area*.	20 days
4	(a) *Post-disaster buildings*. (b) *Buildings* to which Subsection 3.2.6. or any provision in Articles 3.2.8.3. to 3.2.8.11. applies.	30 days
Column 1	Column 2	Column 3

(5) The requirements for an application referred to in Sentence (1) for a permit under Subsection 8(1) of the Act are:

(a) that the application be made in the form described in Sentence 2.4.1.1A.(2),
(b) that the application be signed by a person described in Clause 2.4.1.1A.(1)(a) or (b),
(c) that all applicable fields on the application form and required schedules are completed,
(d) that all attachments indicated as being attached to the application are submitted with the application, and
(e) that the application be accompanied by the types and quantities of plans and specifications that are prescribed by the applicable by-law, resolution or regulation made under Clause 7(1)(b) of the Act.

3. Applicant's Position

The Agent for the Applicant outlined the timeline in respect of the permit applications. He stated that on March 7, 2006 seven sewage system permit applications were submitted to Niagara Region Public Health, along with a cheque for the payment of the fees required to be paid when a permit application is made. He advised that the permits were being sought for the construction of seven individual Class 4 sewage systems on seven separate residential lots. He claimed that the Respondent had neither issued the permits nor refused to issue the permits and provide all reasons for the refusal within the prescribed time frame.

The Agent submitted that the cheque for the fees was cashed on April 13, 2006. He further advised that during this timeline, the health unit had some concerns with respect to whether the lots in question were, in fact, registered, conveyable lots. The Agent confirmed that the lots in question are, in fact, registered and referenced a November 18, 2002 letter, which was included in his submission.

The Agent affirmed that, in his opinion, the applications for permit contained all of the requirements prescribed in Sentence 2.4.1.1B.(5) as of March 7, 2006. He made reference to the Health Unit's request that a hydrogeological report be submitted as part of the application process and declared that, in his opinion, this is not a requirement contemplated by Sentence 2.4.1.1B.(5) of the Code. He indicated that he had requested the Health Unit to furnish him with a copy of the by-law which makes reference to the requirement for a hydrogeological report. He advised that to date he has not received a copy of the by-law and believes that there is no authority for the Health Unit to request a hydrogeological report.

In summation, the Agent reiterated that it his belief that the permit applications met the requirements outlined in Sentence 2.4.1.1B.(5) of the Code on March 7, 2006 and, therefore, the Public Health Unit was required to make a determination on the subject permits within ten days. Additionally, he stated that, in his opinion, a hydrogeological report is not warranted in this instance.

4. Respondent's Position

The Designate for the Respondent concurred that seven permit applications, along with the applicable fees, were received by the Niagara Public Health department on March 7, 2006. He advised that, upon initial review of applications, it was unclear whether the lots were appropriately registered as separate deeded lots and further advised that a letter was sent requesting that this matter be clarified. He agreed that the Public Health Unit is now satisfied that the subject lots are indeed lots of record.

The Designate explained that the Agent for the Applicant was verbally advised that a hydrogeological report would be required even after the planning matters had been resolved. He further explained that the Niagara Public Health department still considers the permit applications to be "incomplete" even as of the date of the hearing because the hydrogeological report has not been submitted.

The Designate advised that the permit applications meet the requirements outlined in Sentence 2.4.1.1B.(5) of the Building Code with the exception of Clause 2.4.1.1B.(5)(e). He maintained that the request for a hydrogeological report is relevant under Clause 2.4.1.1B.(5)(e). When questioned as to whether the applicable by-law specifies a requirement for a hydrogeological report, the Designate responded that the by-law does not specifically reference a hydrogeological report.

In summary, the Designate declared that, in his opinion, the Public Health department is legally entitled to request a hydrogeological report under the *Building Code Act, 1992*. He further declared that, in the absence of the hydrogeological report, the permit applications are incomplete. Therefore, he concluded that the applicable time period for processing building permits has not yet commenced.

5. Commission Ruling

It is the Decision of the Building Code Commission that the Respondent did not comply with the requirements of Subsections 8(2.2) and 8(2.3) of the *Building Code Act, 1992* and Sentence 2.4.1.1B.(1) of the Building Code. Under these subsections, the Respondent is required to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal, within the applicable time period set out in Table 2.4.1.1B. of the Building Code.

Further, pursuant to subsection 24.-(3.1) of the *Building Code Act, 1992*, the Building Code Commission Orders the Respondent to comply with subsection 8(2.2) and 8(2.3.) of the *Building Code Act, 1992* and Article 2.4.1.1B. of the Building Code for properties located at Lots 1-7, Plan 327, Town of Niagara-on-the-Lake.

6. Reasons

i) Sentence 2.4.1.1B.(6) of the Building Code specifies when the time periods set out in Table 2.4.1.1B. commence:

The time period described in Sentences (1) to (3) shall begin on the day following the later of

(a) the day on which an application meeting the requirements of Sentence (5) is submitted to the chief building official, and

(b) the day on which payment is made of all fees that are required, under a by-law, regulation or resolution made under Clause 7(1)(c) of the Act, to be paid when the application is made.

The parties agreed that the permit applications were submitted to the Town on March 7, 2006. Based on the evidence presented, the Commission finds that, on March 7, 2006, the permit applications met the requirements prescribed in Sentence 2.4.1.1B.(5) of the Building Code.

As a result, it is March 8, 2006 (the day following the day on which an application meeting the requirements of Sentence (5)) that the applicable time period set out in Table 2.4.1.1B. commenced in this case.

ii) The parties agreed that the construction proposed under the applications in question was subject to the ten day time period set out in Column 3 of Row 2 in Table 2.4.1.1B.

Sentence 2.4.1.1B.(7) provides that the time periods described in Column 3 of Table 2.4.1.1B. do not include Saturdays, holidays and all other days when the offices of a principal authority are not open for the transaction of business with the public.

In the present case, the applicable ten day time period ended on March 22, 2006. The Respondent was required to issue or refuse to issue permits in respect of the Applicant's permit applications by that date. If the permits were refused, the Respondent was to provide in writing all reasons for refusal.

iii) The Commission notes that, pursuant to s. 8(2.2.) of the *Building Code Act, 1992*, where an application for a permit contains the prescribed information, the service level duties of, in this case, the Medical Officer of Health are triggered. The "prescribed information" is set out in Clauses 2.4.1.1B.(5)(a) to (e) of the Building Code. Upon receipt of an application for permit containing the prescribed information, the Medical Officer of Health is obligated, by virtue of Sentence 2.4.1.1B.(1), to, within the time period set out in Sentence 2.4.1.1B.(3) and Column 3 of Table 2.4.1.1B., either issue the permit or refuse to issue the permit and provide in writing all reasons for the refusal.

Furthermore, the Commission notes that if non-compliance with applicable law, including the *Planning Act*, was in question, this could have been a reason for refusing to issue the permits. All reasons ought to have been communicated to the

Applicant in writing within the prescribed time period.

iv) Clause 2.4.1.1B.(5)(e) of the Building Code states that the application be accompanied by the types and quantities of plans and specifications that are prescribed by the applicable by-law, regulation or resolution made under Clause 7(1)(c) of the Act. The Commission notes that evidence was presented which indicated that the applicable by-law did not specifically require a hyrdrogeological report as part of an application for approval of a septic permit. Therefore, in the opinion of the Commission, the absence of a hydrogeological report at the time of application does not support the Respondent's position that the permit applications were "incomplete". While, in the opinion of Niagara Public Health, a hydrogeological is required, that requirement ought to have been communicated to the Applicant, in writing, within the prescribed time period, as a reason for refusing to issue the permits.

The Commission notes that the validity, legality or reasonableness of the reasons for refusal of a permit identified in writing by the municipality is not within the mandate of the Commission to determine as part of this service level appeal.

Application No. 2006-57

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 9.8.8.1.(1) of the Regulation 403, as amended, (the Building Code).

AND IN THE MATTER OF an application by Roger Ball, EBD Financial Planners Inc., for resolution of a dispute with Ann Borooah, Chief Building Official, City of Toronto, to determine whether the as-installed guard, without a locking device, situated on a portion of the stationary platform serving an automated elevating device in the garage of a single family dwelling, provides sufficiency of compliance with Sentence 9.8.8.1.(1) of the Building Code at 1840 Lakeshore Boulevard East, City of Toronto, Ontario.

APPLICANT	Roger Ball EBD Financial Planners Inc. Toronto, ON
RESPONDENT	Ann Borooah Chief Building Official City of Toronto
PANEL	Tony Chow, Chair Alison Churchill Mina Tesseris
PLACE	Toronto, Ontario
DATE OF HEARING	January 18, 2007
DATE OF RULING	January 18, 2007
APPEARANCES	Roger Ball EBD Financial Planners Inc. Toronto, ON **The Applicant** Martin Elksnitis Building Inspector **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Order to Remedy Unsafe Building under the *Building Code Act*, *1992*, to remedy certain alleged deficiencies at 1840 Lakeshore Boulevard East, City of Toronto, Ontario.

The subject building is a Group C residential dwelling. It is the garage of this residential dwelling that is the central location for the subject dispute. The garage is one storey in building height and has a 1.8 m deep "pit" below grade. The garage is approximately 20 m^2 in area and is comprised of combustible construction material.

The single car garage is equipped with a car elevating device which allows for occupants of the dwelling unit to park more than one vehicle within the garage. In the centre of the garage there is a below grade pit within which the automated platform operates. A stationary platform is located at the rear of the garage. A car is driven into the garage and onto the automated platform. Occupants of the vehicle then exit the vehicle and proceed to the stationary platform located at the rear of the garage. Once the occupants are safely on the stationary platform, a key is used to activate the elevating device and the vehicle is lowered into the below grade pit. A second platform, located directly above the first platform, simultaneously lowers into place. Once the first platform has reached the bottom of the pit, the second platform is level with the garage floor and is available for a second car to be parked in the garage.

When the platform is in motion and not level with the garage floor, there is a difference in elevation of more than 600 mm. In accordance with Sentence 9.8.8.1.(1) of the Building Code, where there is a difference in elevation of more than 600 mm between adjacent surfaces, every surface shall be protected by a guard.

The Applicant has installed a guard, which is approximately 1.2 m in both height and width, to protect a triangular area of the stationary platform. The switch for operating the elevating device is located within the triangular area of the stationary platform. The switch is spring loaded and a key is required to be turned and a button pushed in order to operate the elevating device. The guard is located at the rear of the garage, with the hinge side of the swinging guard located on the west wall of the garage and the latch side of the guard being located on the south wall. The guard swings toward the platform and away from the elevating device.

The issue at dispute between the Applicant and the Respondent is whether the as-installed guard, without a locking device, situated on a portion of the stationary platform sufficiently complies with the requirements of the Building Code.

2. Provisions of the Building Code in Dispute

9.8.8.1. Required Guards

(1) Except for the edges of floor pits in *repair garages* and loading docks, every surface to which access is provided for other than maintenance purposes, including but not limited to exterior landings, porches, decks, balconies, *mezzanines*, galleries, raised *walkways* and roofs, shall be protected by a *guard* on each side which is not protected by a wall and where there is a difference in elevation to adjacent surfaces of more than 600 mm.

3. Applicant's Position

The Applicant referred to pictures included in his submission and described the car elevating device as having two platforms which move up and down simultaneously. He informed the Commission that it takes approximately 45 seconds to elevate the platform from the below grade pit level to the level of the garage floor. In describing the daily use of the elevating device, he stated that the elevating device is used an average of three to four times a day and therefore the platform is in motion approximately two to three minutes per day.

The Applicant stated that the garage is a single car garage and quite narrow. He further stated that it is necessary to park a car on an angle so as to allow sufficient room to exit the vehicle. He advised that he is not seeking a waiver to the requirements of the Building Code but added that he feels the solution needs to be practical as well as safe.

The Applicant briefly recounted how he has attempted, without success, to resolve the matter with the City and provided a brief overview of his previous hearing with the Building Code Commission. He advised that his proposal to relocate the switch, ruled by the Commission as providing sufficiency of compliance with the Building Code at his previous hearing, was not practical. He claimed that with the operating switch located outside of the garage and the doors of the garage having to be closed in order for the elevating device to operate, it was difficult to determine which vehicle was at grade and furthermore it was difficult to determine when the elevating device had completed its cycle. He stated that his proposal to relocate the operating switch to the exterior of the garage did not include having to interconnect the switch with the swing door as well as the overhead garage door. This condition, however, was imposed by the Commission in its ruling.

The Applicant stated that the moveable guard, which he has installed, provides a triangular shaped area on the stationary platform from which the spring loaded key switch is operated. He described the guard as being a 1.2 m high by 1.2 m wide chain link gate that swings toward the platform. He explained that the angle of the guard is necessary so as to allow the driver to exit the vehicle and walk to the guarded area of the platform without having to exit the garage. He informed the Commission that, in his opinion, there is very little risk of injury to anyone operating the elevating device.

The Applicant declared that, in his opinion, the City's request that a keyed locking device be added to the as-installed guard is not warranted. He advised that he sees no material difference between what he has installed and a guard that is equipped with a keyed locking device. He maintained that the guard that he has installed provides the safety required by the Building Code while maintaining the functionality of the garage and elevating device.

In summation, the Applicant argued that the as-installed guard meets the intent of the Building Code with respect to life safety concerns while still maintaining the functionality of the design and intended use of the elevating device and garage. He reiterated his position that the addition of a keyed locking device on the guard does not provide any additional safety. He stated that he could add a padlock to the guard if there is a need to do so but submitted that he sees no need for this additional feature as he believes that the as-installed guard meets the intent of the Building Code.

4. Respondent's Position

The Designate for the Respondent submitted that an Order to Remedy Unsafe Building was issued to the Applicant in January 2006. The Order indicated that, pursuant to Sentence 9.8.8.1.(1) of the Building Code, guards were required to be provided within the single car garage. He stated that when the car elevating device is not level with the garage floor, the difference in elevation is greater than 600 mm, therefore, in his opinion, a guard is required along the edge of the stationary platform to prevent injury from falls.

The Designate recounted that the Applicant appealed to the Building Code Commission for a sufficiency of compliance ruling. He advised that the Commission's ruling was in favour of the Applicant but that the ruling (06-24-1094) required the Applicant to interconnect the key switch with the swing door as well as the overhead garage door, so as to prevent the elevating platform from being operated unless both doors are closed.

The Designate claimed that the Applicant did not comply with the condition included as part of previous ruling but instead installed the guard that is the subject of this hearing. He advised that the City had approved a similar guard system as providing compliance with the requirements of 9.8.8.1. of the Code, he noted however that a locking device formed part of the guard system that the City had approved as complying with the Building Code.

The Designate indicated that on November 23, 2006, the subject guard was inspected and it was noted that a locking device had not been installed as part of this guard. He advised that in his opinion the as-installed guard requires a locking device in order to achieve compliance with Sentence 9.8.8.1.(1) of the Building Code. He suggested that the as-installed guard would be acceptable if a keyed locking device was installed as part of the guard system.

In summation, the Designate reiterated that the as-installed guard without a locking device does not comply with the requirements of Sentence 9.8.8.1.(1) of the Building Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the as-installed guard, without a locking device, situated on a portion of the stationary platform serving an automated elevating device in the garage of a single family dwelling, does not provide sufficiency of compliance with Sentence 9.8.8.1.(1) of the Building Code at 1840 Lakeshore Boulevard East, City of Toronto, Ontario.

6. Reasons

i) The requirements for guards as outlined in Sentence 9.8.8.1.(1) of the Building Code are based on the premise that, where there is a difference in elevation of 600 mm or more between two surfaces, a guard shall be provided to minimize the risk of injury to persons as a result of tripping, slipping or falling. In the opinion of the Commission, a locking device will serve to ensure that the as-installed guard is secure when the automated elevating device is in operation. Furthermore, a locking device will serve to ensure that access to the unprotected portion of the platform is restricted and controlled.

AND IN THE MATTER OF with Sentence 3.7.4.2.(2) and Table 3.7.4.3. A. of the Regulation 403/97, as amended, (the Building Code).

AND IN THE MATTER OF an application by The Shaw House Corporation for the resolution of a dispute with Ann Borooah, Chief Building Official and Executive Director, City of Toronto, to determine whether the proposed revised design of a multi-use building with Group C and Group A Division 2 occupancies, where the Group A Division 2 occupancy will be served by one barrier-free washroom and one additional washroom and where both washrooms are intended to serve both sexes, provides sufficiency of compliance with Sentence 3.7.4.2.(2) and Table 3.7.4.3. A. of the 1997 Building Code at The Shaw House on 108 Lakeshore Avenue, Toronto, Ontario.

APPLICANT	Marty Crowder The Shaw House Corporation Homeowner Toronto, ON
RESPONDENT	Ann Borooah Chief Building Official City of Toronto
PANEL	Tony Chow, Chair Gary Burtch Susan Friedrich
PLACE	Toronto, Ontario
DATE OF HEARING	December 11, 2008
DATE OF RULING	December 11, 2008
APPEARANCES	Ellen Vera Allen Ellen Vera Allen Architect Toronto, ON **Agent for the Applicant** Diane Byam Grannum Zoning Building Code Examiner City of Toronto **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant applied for a permit under the *Building Code Act*, *1992*, to renovate the first storey of an existing residential building where the existing four bed-sitting rooms were converted into two single bedroom suites containing their own kitchen and washroom at The Shaw House on 108 Lakeshore Avenue, Toronto, Ontario.

The subject building is two storeys in building height, of combustible construction, and has been subject to renovation work requiring a building permit from the municipality. Prior to the proposed renovation, the first storey of the building contained four single bedroom suites called bed-sitting rooms or bedsits, which were served by a common living/dining/kitchen area and the second storey contained two dwelling units. Each of the bedsits on the first floor contained individual washroom facilities, with the common living/dining/kitchen area being served by a separate washroom.

As part of the renovation proposal, the four bedsits were converted into two single bedroom suites, each containing their own kitchen and washroom. The former combined living/dining/kitchen common area was converted into a “common area”. The building permit obtained by the Applicant initially showed two barrier-free washrooms serving the common area. One of the washrooms existed prior to the proposed work, and although not fully compliant with the barrier-free design requirements of the Code, the Respondent accepted it as such because the new washroom facility being proposed, as per the drawings submitted by the Applicant, was in full conformance with the barrier-free design requirements of the Code.

Subsequent to the issuance of the permit, a revision was applied for by the Applicant in respect of the proposed new barrier–free washroom. The revised application proposed to modify the layout of the new washroom in a manner that the Respondent believes no longer makes it compliant with the barrier-free design requirements of the Code.

Therefore, the dispute before the Commission is whether the proposed revised design of the multi-use building with Group C and A2 occupancies, where the A2 occupancy will be served by one barrier-free washroom and one additional washroom and where both washrooms are intended to serve both sexes, provides sufficiency of compliance with Sentence 3.7.4.2.(2) and Table 3.7.4.3.A. of the 1997 Building Code at The Shaw House on 108 Lakeshore Avenue, Toronto, Ontario

2. Provisions of the Building Code in Dispute

3.7.4.2. Plumbing Fixtures, General

(2) Except as provided in this Subsection, water closets shall be provided for each sex assuming that the *occupant load* is equally divided between males and females, unless the proportion of each sex expected in the *building* can be determined with reasonable accuracy.

Table 3.7.4.3.A.
Water Closets for Assembly Occupancies

Forming Part of Sentence 3.7.4.3.(1)

Number of Persons of Each Sex	Minimum Number of Water Closets for Each Sex
1 - 25	1
26 - 50	2 3 plus 1 for each additional increment of 50 persons of each sex in excess of 50
Column 1	2

3. Applicant's Position

The Agent for the Applicant submitted that the common area will be served by two washrooms and therefore it will be in compliance with the requirements of the Code in terms of the minimum number of water closets for each sex.

Further, the Agent maintained that the existing washroom is considered to be "accessible", thereby, providing compliance with the barrier-free washroom requirements of the Code. The Agent also submitted that since signs have not been posted on either of the washrooms, the "accessible" and non-accessible washroom can be used by either males or females and therefore a second barrier-free washroom is not required.

The Agent reported that she disagreed with the Respondent's position that since the Code requires separate washrooms for each sex, it then implies that two barrier-free washrooms are required, one designated for females and one designated for males. The Agent argued that since the two washrooms are single washrooms, they are in fact unisex and do not need to be designated male or female. Further, the Agent reported that the common area was previously served by one accessible washroom, which was quite adequate for the facility when used for community purposes.

However, in response to questions, the Agent later advised that the Applicant would provide one code compliant barrier-free washroom and further agreed that it was the 1997 Building Code that was applicable in this matter.

4. Respondent's Position

The Designate for the Respondent submitted that the washrooms subject to this dispute serve the common area on the first floor of the subject building. The Designate reported that the original permit application indicated that the occupant load for the first floor is 36 persons, 6 of which are assigned to the Group C occupancy, based on 2 persons per sleeping area, therefore, the occupant load served by the washrooms in question is 30 persons.

The Designate explained that Sentence 3.7.4.2.(2) of the Code requires that washrooms be allocated on the assumption that there are equal numbers of males and females, therefore, implying that unisex washrooms do not meet this Code requirement. Referring to Table 3.7.4.3.A of the Code, the Designate stated that as the common area has an occupant load of 30 persons

the Code would require one water closet/sex.

The Designate contended that, by virtue of Article 3.8.2.3. of the Code, barrier-free washrooms are required to be provided in all floor areas with a barrier-free path of travel, therefore, in this case both washrooms are required to be barrier-free. In addition, the Designate noted that as the subject property is a senior citizen's facility, it would appear to be even more important that a barrier-free washroom serving each sex be provided.

The Designate for the Respondent submitted that the approved permit for the renovation work at the subject building provided for one-barrier-free washroom in addition to the existing accessible washroom, which although not fully compliant with the barrier-free design requirements of the Code, was considered acceptable, however, the requested revision does not comply with the Code. The Designate added that there were no physical constraints preventing the construction of a new barrier-free washroom as per the plans that were initially proposed and approved by the municipality.

In response to questions, the Designate agreed that the 1997 Building Code was applicable in this matter.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposed revised design of a multi-use building with Group C and A2 occupancies, where the A2 occupancy will be served by one barrier-free washroom and one additional washroom and where both washrooms are intended to serve both sexes provides sufficiency of compliance with Sentence 3.7.4.2.(2) and Table 3.7.4.3. A. of the 1997 Building Code at The Shaw House on 108 Lakeshore Avenue, Toronto, Ontario on condition that:

a) The original, existing accessible washroom shall be modified in order to meet all requirements for a barrier-free washroom as per Article 3.8.3.12 of the 1997 Building Code.

6. Reasons

i) The Commission was advised that the Applicant will provide one code compliant barrier-free washroom.

ii) Both parties agree that the 1997 Building Code is applicable in this matter. Therefore, as per Article 3.7.4.3. and Table 3.7.4.3.A. of the 1997 Code, the minimum number of water closets required for each sex is one. It is the Commission's opinion that one washroom, modified to meet the barrier-free requirements, provides sufficiency of compliance with Sentence 3.7.4.2.(2) and Table 3.7.4.3. A. of the Building Code.

iii) The Code does not require either the newly constructed washroom or the modified barrier-free washroom to be designated for male or female.

AND IN THE MATTER OF an application by Michelle Baily, for the resolution of a dispute with Ken Jones, Chief Building Official, Township of Minden Hills, to determine whether the as installed guards, having been constructed to a height of 754 mm, serving two sets of stairs in a two storey, seasonal residential dwelling, provide sufficiency of compliance with Sentences 9.8.8.3 (2) and 9.8.8.3 (4) of the 2006 Building Code at 1048 Pilgrim Lane, Minden, Ontario.

APPLICANT	Michelle Baily Homeowner Toronto, ON
RESPONDENT	Ken Jones Chief Building Official City of
PANEL	Tony Chow, Chair Gary Burtch Susan Friedrich
PLACE	Toronto, Ontario
DATE OF HEARING	December 11, 2008
DATE OF RULING	December 11, 2008
APPEARANCES	Michelle Baily Homeowner Toronto, ON **Applicant** Colin McKnight Building Inspector Township of Minden Hills, ON **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Order to Comply under the *Building Code Act*, *1992*, to remedy certain alleged code deficiencies at 1048 Pilgrim Lane, Minden, Ontario.

The subject building is a two storey residential occupancy that is intended to be used on a seasonal basis. It is of combustible construction and measures 98. 84 m² in building area.

The construction in dispute involves the height of the guard provided for two sets of interior stairs. The interior stairs in question serve the first and second storeys and the first and basement storeys. The height of the as constructed guards protecting both sets of stairs is 754 mm. An Order to Comply has been issued by the municipality requiring remedial action from the Applicant which is to increase the height of the disputed guards.

2. Provisions of the Building Code in Dispute

9.8.8.3 (2) All *guards* within *dwelling units* shall be not less than 900 mm high.

9.8.8.3 (4) *Guards* for flights of steps, except in required *exit* stairs, shall be not less than 900 mm high.

3. Applicant's Position

The Applicant submitted that the building in question is a seasonal two storey residential dwelling, which the Applicant and her family use. She reported that the guards in question serve the staircase from the basement level to the first floor and from the first floor to the second storey.

The Applicant stated that the contractor hired to construct the subject guards inadvertently built the guards to the wrong height. The Applicant advised that the guards installed on the horizontal floor areas of the dwelling are compliant and in fact, exceed the minimum height requirement of the Code by 178 mm (7 inches). However, the guards serving the two sets of stairs were built to a height of 754 mm, below the minimum 900 mm height required by the Building Code.

The Applicant argued that the note provided in Appendix A to the Building Code suggests that a height lower than the required height can be permitted in a dwelling unit because the occupants are expected to be familiar with the potential hazards and additionally, pushing and jostling is unlikely to occur in such a setting. The Applicant also argued that the as-built guards have sufficient structural strength to resist the load likely to be imposed by the users of the stairs.

The Applicant submitted that to replace the installed guards on both staircases would be quite costly and would therefore prefer to find an alternative measure to remedy the situation. The Applicant proposed to install a length of 2x4 directly over the existing handrail. In response to questions the Applicant advised the Commission that a space of approximately 50 mm (2 inches) will be maintained between the length of the 2x4 and the existing handrail to achieve the minimum guard height required by the Code.

4. Respondent's Position

The Designate for the Respondent submitted that the guards on the two sets of interior stairs in the subject two storey seasonal residential dwelling have been constructed to a height of 754 mm. The Designate stated that the guards in question do not conform to the minimum prescribed height requirement of 900 mm and therefore, do not provide the minimum level of safety anticipated by the Code.

In response to the Applicant's argument regarding the note provided in Appendix A to the Building Code, the Designate stated that in his opinion, the commentary provided in the Appendix provides an explanation for the height reduction permitted for guards within dwelling units from 1070 mm to 900 mm. However, he believed that it was not intended to support a further reduction of a guard height to less than 900 mm as suggested by the Applicant.

The Designate explained that he was sympathetic to the Applicant's position and was open to the discussion of an alternate solution in order to resolve the dispute.

5. Commission Ruling

It is the Decision of the Building Code Commission that the as installed guards, having been constructed to a height of 754 mm, serving two sets of stairs in a two storey, seasonal residential dwelling, provide sufficiency of compliance with Sentences 9.8.8.3 (2) and 9.8.8.3 (4) of the 2006 Building Code at 1048 Pilgrim Lane, Minden, Ontario.

6. Reasons

i) Sentence 9.8.8.3 (2) of the Building Code states, "All *guards* within *dwelling units* shall be not less than 900 mm high" and Sentence 9.8.8.3.(4) states, **"***Guards* for flights of steps, except in required *exit* stairs, shall be not less than 900 mm high".

The subject guards have been constructed to a height of 754 mm, however, the Applicant has proposed to install a length of 2x4 directly over the existing handrail. The Commission was advised that a space of approximately 50 mm (2 inches) will be maintained between the length of the 2x4 and the existing handrail. The combination of the 50 mm space and the width of the 2x4 will provide additional height to the existing guards, achieving the minimum guard height required by the Code. Therefore, it is the Commission's opinion that the as-installed guards along with the compensating measure proposed by the Applicant, will result in guards that sufficiently comply with the Code.

ii) Although climbability of the installed guards was not initially part of the subject dispute, the issue of climbability was raised in relation to the proposed modified guards.

Sentence 9.8.8.6. (1) states:*Guards* required by Article 9.8.8.1., except those in *industrial occupancies* and where it can be shown that the location and size of openings do not represent a hazard, shall be designed so that no member, attachment or opening will facilitate climbing.

The location of the space created between the existing handrail and the length of 2x4 will be at the top of the guard, and in the opinion of the Commission, the location of this opening does not facilitate climbing or present a hazard.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Part 8 and Part 11 of the Regulation 403/97, as amended, (the Building Code).

AND IN THE MATTER OF an application by Ted Antkow, Homeowner, for resolution of a dispute with Bill Goodale, Chief Building Official, C.C. Tatham & Associates Ltd., to determine whether the proposed repair of an existing Class 4 sewage system provides sufficiency of compliance with Part 8., when considering Part 11 of the Building Code at 305 Concession 11 W, Tiny Township, Ontario.

APPLICANT	Ted Antkow Homeowner Mississauga, ON
RESPONDENT	Bill Goodale Chief Building Official C.C. Tatham & Associates Ltd
PANEL	Judy Beauchamp, Vice Chair
PLACE	Toronto, Ontario
DATE OF HEARING	November 20, 2008
DATE OF RULING	November 20, 2008
APPEARANCES	Ted Antkow Mississauga, ON **The Applicant** Bill Goodale Chief Building Official C.C. Tatham & Associates **The Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Unsafe Order under the *Building Code Act*, *1992*, requiring that a building permit be obtained and that the existing sewage system be replaced at 305 Concession 11 W, Township of Tiny, Ontario.

The subject building is described as a one and a half storey, two bedroom, seasonal cottage, having a building area of approximately 64 m^2. The dwelling is served by a private dug well and has a total of 7.5 plumbing fixture units.

The construction in dispute relates to the proposal by the Applicant to upgrade the existing Class 4 sewage system by relocating the existing tile bed and replacing the existing septic tank with a new 3 000 litre septic tank. The existing system consists of a 1, 800 litre septic tank connected to a leaching bed. The subject sewage system has been in existence for approximately 40-45 years.

The issue at dispute pertains to whether the Applicant's proposal to replace the existing septic tank and relocate the tile bed addresses the unsafe situation and provides sufficiency of compliance with Part 8 when considering Part 11 of the Building Code. Both parties, however, were not in agreement regarding the scope of the technical provisions applicable to this matter.

Further, prior to the hearing, the Respondent raised an objection to the subject application before the Building Code Commission. The Respondent questioned whether the contents of the application to the Commission were in any material way different from the Applicant's two previous applications heard by the Commission and whether the Commission could hear a third Application submitted by the Applicant regarding, in his opinion, the same matter.

Therefore, at the outset of the hearing, the presiding Member determined that the issue of whether the Commission had the jurisdiction to make a determination in this matter would need to be addressed prior to holding a hearing regarding sufficiency of compliance with the technical provisions of the Building Code. As a result, what followed were preliminary questions and answers where the parties spoke to the issue of jurisdiction.

2. Provisions of the Building Code in Dispute

Part 8 – Sewage Systems

(Please see Part 8 of the Building Code)

Part 11 – Renovation

(Please see Part 11 of the Building Code)

Both parties were not in agreement as to which technical provisions of the Building Code are in dispute.

3. Applicant's Position

In response to questions, the Applicant submitted that he had applied for a new building permit since his previous application and hearing before the Building Code Commission. He stated that that he had submitted a new building permit application in response to an Unsafe Order and

subsequently received a letter of rejection from the Respondent. However, upon answering further questions from the Commission, the Applicant conceded that the letter addressed to the Respondent, dated June 17, 2008, which he considered to be a building permit application, was not submitted using the proper form, nor was it accompanied with drawings or plans for the proposed new construction of the septic system and there were no permit fees submitted with the letter.

In response to further questions from the Commission, the Applicant stated that he had not received a new Order under the *Building Code Act* since his previous application and hearing before the Commission. However, in a later submission after the Respondent stated that a new Unsafe Order, dated July 7, 2008, had been issued to the Applicant, the Applicant clarified that he did not determine this Order to be new, as it was virtually the same as the Order dated November 28, 2005, in that the new Order contained virtually the same wording and content as the previous Order.

In summary, the Applicant explained that he believed his current application before the Commission was different from his previous applications, in that he wanted to address the issues of health and safety with respect to Part 11 of the Building Code, which he believed were two areas that he did not address in his previous hearings before the Commission.

4. Respondent's Position

Prior to the commencement of the hearing the Respondent raised an objection to the subject application before the Building Code Commission. The Respondent questioned whether the contents of the Application to the Commission were in any material way different from the Applicant's two previous applications heard by the Commission and whether the Commission could hear a third Application submitted by the Applicant regarding, in his opinion, the same matter.

In response to questions, the Respondent submitted that no new building permit application had been made by the Applicant since the previous application and hearing before the Commission. However, the Respondent acknowledged receipt of the letter dated June 17, 2008, which the Applicant referred to in his statement to the Commission. However, the Respondent stated that the subject letter was not deemed a new building permit application, as it was not submitted on the required form; it was not accompanied with the required drawings and/or documentation of the proposed construction as per the Building Code Act, and it was not submitted with the required building permit fee.

In response to further questions, the Respondent advised that a new Order dated July 7, 2008 had been issued to the Applicant and he agreed that the content of the new Order was virtually the same as the previous Order dated November 28, 2005 and that it contained no new information.

In summary, the Respondent stated that the subject application before the Commission was the Applicant's third application and that two previous Commission rulings determined that the Applicant's proposal did not provide sufficiency of compliance with the Building Code. Further, the Respondent argued that the Applicant's June 17, 2008 letter is not a new building permit application nor does it provide any substantially new information or address all of the provisions in the Building Code that are of concern. As a result, the Respondent maintained that the subject application before the Commission is indeed not a new application and therefore, does not require a new hearing.

5. Commission Ruling

It is the Decision of the Building Code Commission that, under subsection 24(1) of the *Building Code Act, 1992*, the Commission does not have the jurisdiction to make a determination on the issues raised in relation to the matter at 305 Concession 11 W, Tiny Township, Ontario.

6. Reasons

i) Section 24 of the *Building Code Act, 1992* sets out the jurisdiction of the Building Code Commission and subsection 24(4) of the Act indicates that a decision of the Commission is final. The Commission does not have a policy, nor does the legislation provide for, re-examination or reconsideration of matters that have been decided upon after a full and fair hearing.

ii) The Commission was advised that since the previous Application and Ruling of the Building Code Commission, the Applicant has not applied for a new building permit application regarding this matter, nor has the Applicant submitted any substantially new design information for the repair of the existing septic system. Although the Commission was advised that a new Order has been issued to the Applicant, both parties agree that the new Order is not substantially different, neither in its wording or content than the previous Order issued to the Applicant, which was disputed in a previous Commission hearing.

iii) As there is no substantial difference between this Application and the previous Application to the Building Code Commission, it is the opinion of the Commission that the subject application is an appeal of the earlier Building Code Commission's Decision.

iv) Further, it is the opinion of the Commission that since the Act indicates that a decision of the Commission is final, allowing the Applicant to proceed with this Application would not give the previous decision of the Commission the finality required by section 24. As well, allowing the Applicant to proceed with this application could also result in duplicitous proceedings before the Commission and could potentially result in inconstant rulings between different panels of the Commission.

Dated at Toronto this **5th** day in the month of **December** in the year **2008** for application number **S-2008-31.**

AND IN THE MATTER OF an application by Will Jaques, CAO, Municipality of West Perth, for the resolution of a dispute with Bob McLean, Chief Building Official, Municipality of West Perth, to determine whether the total daily design sanitary sewage flow for a proposed Class 4 Sewage System serving a Group A, Division 2 major occupancy, having been calculated for an "Assembly Hall with food service provided" with a daily design sanitary sewage flow of 36L per seat, sufficiently complies with Article 8.2.1.3. and Table 8.2.1.3. B of the Building Code at 6708 Perth Line 344, Con, 9 N. Pl. Lot 28, Brodhagen, Ontario.

APPLICANT	Will Jaques Municipality of West Perth Mitchell, ON
RESPONDENT	Bob McLean Chief Building Official Municipality of West Perth
PANEL	Judy Beauchamp, Chair-Designate Jim Wilkinson Eric Gunnell
PLACE	Toronto, Ontario
DATE OF HEARING	November 20, 2008
DATE OF RULING	November 20, 2008
APPEARANCES	Nick Aroutzidis NA Engineering Associates Inc., Stratford, ON **Agent for the Applicant** Bob McLean Chief Building Official Municipality of West Perth **The Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for a permit under the *Building Code Act*, *1992*, to construct a new onsite sewage treatment system to service a "community centre" at 6708 Perth Line, # 44, Con. 9 N. P1. Lot 28, Brodhagen, Ontario.

The subject building is a new one storey building having a total finished area of approximately 700 m^2 that will include 105 fixture units. The facility is described as a community hall and has been classified as having a Group A, Division 2 major occupancy.

The construction in dispute relates to the design capacity of a new sewage system proposed to serve the community hall. The Building Code regulates "sewage systems" that have a design capacity of less than 10,000 litres per day. The *Ontario Water Resources Act* regulates systems where the design capacity is greater than 10,000 per day as such a system would be considered a "sewage works". One aspect of the dispute before the Commission is whether the subject Class 4 sewage system falls under the *Building Code Act* or the *Ontario Water Resources Act.*

Sentence 8.2.1.3.(2) of the Building Code specifies for all occupancies, other than residential occupancies, the total daily design sanitary sewage flow shall be at least the value in Column 2 of Table 8.2.1.3.B. Table 8.2.1.3.B. of the Code lists various types of establishments and assigns a specific volume to be used to calculate the total daily design sanitary sewage for each establishment.

The Applicant contends that the subject facility is an "Assembly Hall establishment with food service provided" as listed in Table 8.2.1.3.B. of the Building Code with a daily design sanitary sewage flow of 36L per seat resulting in a total daily design sewage flow of less than 10, 000 L/day, and as such is regulated under the Building Code.

The Respondent contends the subject facility is a "Restaurant" or a "bar and cocktail lounge" both of which result in a daily design sewage flow rate of 125L per seat, which results in a total daily design sewage flow greater than 10, 000L/day and therefore, falls under *the Ontario Water Resources Act.*

The dispute between the parties has a couple of inter-related components, one related to whether the proposed system is considered a "sewage system" or a "sewage works" and consequently, whether the Building Code or the *Ontario Water Resources Act* is the governing legislation. Also at issue, is which daily design sanitary sewage flow rate listed in Table 8.2.1.3.B. is to be used when calculating the design capacity of the subject sewage system.

2. Provisions of the Building Code in Dispute

8.2.1.3. Sewage System Design Flows

(1) For *residential occupancies*, the total daily design *sanitary sewage* flow shall be at least the value in Column 2 as determined from Table 8.2.1.3.A.

(2) For all other *occupancies*, the total daily design *sanitary sewage* flow shall be at least the value in Column 2 as determined from Table 8.2.1.3.B.

(3) Where a *building* contains more than one establishment, the total daily design *sanitary sewage* flow shall be the sum of the total daily design *sanitary sewage* flow for each establishment.

(4) Where an *occupancy* is not listed in Table 8.2.1.3.B., the highest of metered flow data from at least 3 similar establishments shall be acceptable for determining total daily design *sanitary sewage* flow.

Table 8.2.1.3.B.
Other Occupancies

Forming Part of Sentence 8.2.1.3.(2)

Column 1	Column 2
Establishments[(1)]	Volume, litres
Airports, Bus Terminals, Train Stations, Dock/Port Facilities (Food Services excluded)	
a) Per passenger, and	20
b) Per employee per 8 hour shift	40
Assembly Hall - per seat	
a) No food service, or	8
b) Food service provided	36
Food Service Operations	
a) Restaurant (not 24 hour), per seat	125
b) Restaurant (24 hour), per seat	200
c) Restaurant on controlled access highway, per seat	400
d) Paper service restaurant, per seat	60
e) Donut shop, per seat	400
f) Bar and cocktail lounge, per seat	125
g) Drive-in restaurant per parking space	60
h) Take-out restaurant (no seating area)	

Notes to Table 8.2.1.3.B.:
[(1)]The *occupant load* shall be calculated using Subsection 3.1.17.

[(2)]Flea markets open more than 3 days per week shall be assessed using the volumes stated under the heading “Stores”.

[(3)]Where multiple calculations of *sanitary sewage* volume is permitted the calculation resulting in the highest flow shall be used in determining the design daily *sanitary sewage* flow.

[(4)]The number of fuel outlets is considered the maximum number of gas nozzles that could be in use at the same time.

3. Applicant’s Position

The Agent for the Applicant submitted that there are two issues at dispute between the Applicant and the Respondent: the first is whether the subject building can be designed for a capacity of 264 people and the second issue is whether the total daily design sanitary sewage flow for the proposed sewage system serving the community centre should be calculated for an “Assembly Hall with food service provided” with a daily design sanitary sewage flow of 36L per seat or a “Bar and Cocktail Lounge” with a total daily design sewage flow of 125 L/seat.

The Agent stated that it is the Respondent’s position that the total daily design sanitary sewage

flow for the sewage system should be calculated for a “Bar and Cocktail Lounge” using a rate of 125 L/seat.

The Agent argued that the subject building could not be deemed a “Bar and Cocktail Lounge”, as the community centre is not a licensed establishment and therefore, would not be serving alcohol on a continual basis. The Agent stated that the community centre would in fact, only operate for a few hours each day with the exception of occasional events such as a wedding or a ‘buck and doe’.

The Agent explained that the proposed new building is approximately 700 m² and is being built to replace a building on the same site that was destroyed by a fire. The Agent maintained that the previous building was a two storey building, approximately 940 m² and although larger, was served by a smaller septic system without incident.

The Agent stated that the proposed community centre is an unlicensed facility; however, event-specific liquor licenses may be acquired for weddings or ‘buck and doe’ events. He maintained that the proposed use of the building is similar to a number of other facilities in the surrounding townships, which have septic systems that were designed based on a similar daily design sewage flow rate as is being proposed by the Applicant.

The Agent argued that Clause 3.1.17.1.(1)(c) of the Building Code allows the occupancy of a building to be “based on the number of persons for which the area is designed”. Therefore, the total daily design sanitary sewage flow could be calculated for 264 people, as this is the maximum capacity for the building being proposed by the owner.

The Agent explained that the occupant load of 264 people was based on the historic use of the building. The Agent reported that in the past 3 years an average of 60 events per year were held at the previous community hall and of those 60 events; only 10 acquired a license to serve alcohol. The Agent maintained that none of the 10 acquired liquor licenses were for more than 200 people; therefore an occupant load of 264 people was reasonable.

The Agent reported that in calculating the total daily design sewage flow for the sewage system, the following criteria were used:

1. In calculating the occupant load, the occupancy was described as “dining, alcoholic beverage and cafeteria space” and an area of 1.1 m² per person was used. The number of occupants was calculated to be 264 persons.
2. In using Table 8.2.1.3.B, the occupancy was classified as an “Assembly Hall with food provided” and 36L per person was used, which results in a total daily design sewage flow of 9, 504 L/day.

As a result, the Agent maintained that the proposed sewage system has a design capacity that is equal to or less than 10, 000 liters per day and therefore, is considered a “sewage system” under the Building Code Act and not a “sewage works” subject to the Ontario Water resources Act (OWRA).

In summary, the Agent asserted that a total daily design sewage flow of 9, 504 L/day is appropriate for their facility and therefore the proposal sufficiently complies with the Code.

4. Respondent’s Position

The Respondent submitted that the proposed system was not a “sewage system” as defined by the Building Code but rather a “sewage works” subject to the Ontario Water Resources Act (OWRA), and therefore, the permit for construction of this system must be obtained from the

Ministry of Environment (MOE) which administers OWRA.

The Respondent maintained that the method by which the Applicant calculated the total daily design sewage flow is not accurate. Adding, that in his opinion, the Applicant was attempting to find relief from having to apply to MOE for approval of the sewage works by selecting an establishment with a “low” volume sanitary sewage and combining that value with a reduced occupant load to determine a total sewage design capacity that was less than 10 000 L/day.

The Respondent contended that the Architect designed the subject Assembly Occupancy based on 1.10 m² per person for use as a “dining, alcoholic beverage and cafeteria” with an occupant load of 264 persons, however, neglected to give any value to the seating capacity for the meeting room shown in the plans and drawings submitted for the subject building.

The Respondent reported that he calculated the total daily design sewage flow for the subject sewage system to be 35 000 L/day. The Respondent submitted that this total was calculated using the following criteria:

1. There are 5 water closets for each sex being proposed by the applicant, plus one accessible washroom.
2. Sentence 3.7.4.3.(4) of the Code states that the number of water closets required for dining rooms, restaurant and cafeteria shall conform to Table 3.7.4.3.D, which permits an occupancy of 166 to 195 persons for each sex. Therefore the total occupant capacity is 390 persons, which is consistent with the possible occupant design of 410 persons identified in the design matrix. The occupant capacity would include both the main hall and the meeting room.
3. Article 3.7.4.3 of the Code permits a maximum occupant load of 280 persons.
4. Using Table 8.2.1.3.B, the occupancy can be classified as either “Restaurant (not 24 hour)” or “Bar and Cocktail Lounge”, both of which have a flow rate of 125 L per seat. Therefore, when using an occupant load of 280 people, multiplied by a flow rate of 125 L/seat, the resulting total daily design flow is 35 000L/day.

The Respondent argued that in using Table 8.2.1.3.B of the Code, the occupancy of the facility should be deemed either “Restaurant” or “Bar and Cocktail Lounge” with 125 L/seat for a more accurate calculation of the total daily design sewage flow. He contended that the kitchen in the subject facility was designed for full course meal preparation and service as provided at wedding receptions or banquets and is comparable to a restaurant operation. As well, “buck and doe” events with little or no food service can be compared to a bar and cocktail facility. He stated that even a total daily design sewage flow calculation based on an occupant load of 264 people, as proposed by the Applicant, multiplied by 125 L/seat would result in a total daily design sewage flow of 33 000 L/day, far greater than the 10, 000 L/day capacity for a “sewage system” regulated by the Building Code.

In conclusion, the Respondent maintained that a true evaluation of the occupancy of the subject building and assessment of the total daily design sewage flow clearly indicates that the proposed system is a “sewage work” regulated under OWRA.

5. Commission Ruling

It is the Decision of the Building Code Commission that the total daily design sanitary sewage flow for a proposed Class 4 Sewage System serving a Group A, Division 2 major occupancy, having been calculated for an “Assembly Hall with food service provided” with a daily design sanitary sewage flow of 36L per seat sufficiently complies with Article 8.2.1.3. and Table 8.2.1.3. B of the Building Code at 6708 Perth Line 344, Con, 9 N. Pl. Lot 28, Brodhagen, Ontario on condition that:

a) The occupant load shall be limited to a maximum of 264 seats.

6. Reasons

i) Subsection 24(1) of the *Building Code Act, 1992* provides the Building Code Commission (BCC) with the jurisdiction to resolve disputes between a permit applicant, permit holder or a person to whom an order has been issued and the chief building official, a registered code agency or inspector concerning the sufficiency of compliance with the technical requirements of the Building Code.

The *Ontario Water Resources Act,* Section 53 determines whether the *Act* or the Ontario Building Code is applicable to a particular case by stating "This section does not apply to a sewage system that is subject to the *Building Code Act, 1992"*

A sewage system, as defined by the Building Code, requires that the sewage system has a design capacity of 10,000 litres per day or less. Design capacity, as defined in Article 1.4.1.2. of Division A of the Building Code, means that the total daily design sanitary sewage flow must be determined in accordance with Article 8.2.1.3 of Division B.

ii) Sentence 8.2.1.3.(2) of Division B of the Building Code states that the total daily design flow for all occupancies, other than residential occupancies, shall be determined in accordance with Table 8.2.1.3.B.

iii) The Commission heard detailed evidence and testimony describing the use of the community hall and was further advised that the subject property is municipally owned and zoned institutional. It is the Commission's opinion that the subject facility as described is an "Assembly Hall establishment with food service provided" as listed in Table 8.2.1.3.B of the Building Code with a daily design sanitary sewage flow of 36L per seat.

iv) The Commission was advised that the maximum occupant load for the subject building shall be 264 seats. Therefore, the calculated flow as determined from Table 8.2.1.3.B combined with the reported occupant load of the subject facility results in a total daily flow that is less than 10,000 litres per day.

v) It is the Commission's opinion that the proposed Class 4 Sewage System serving a Group A, Division 2 major occupancy, is a sewage system that is subject to the *Building Code Act,* and further sufficiently complies with Article 8.2.1.3. and Table 8.2.1.3. B of the Building Code.

RESPONDENT	Guido Mazza Chief Building Official City of Greater Sudbury Sudbury, ON
PANEL	Yaman Uzumeri, Chair-Designate
PLACE	Toronto, Ontario
DATE OF HEARING	October 17, 2008
DATE OF RULING	October 17, 2008
APPEARANCES	Alain McCann President 1582790 Ontario Ltd. Sudbury, ON **The Applicant** Guido Mazza Chief Building Official City of Greater Sudbury Sudbury, ON **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant applied for two building permits under subsection 8(1) of the Act to construct two single storey duplex dwellings.

The dispute between the parties involves whether the Chief Building Official (the Respondent) complied with subsections 8(2.2) and 8(2.3) of the Act and Division C, Sentence 1.3.1.3.(1) of the Building Code.

2. Provisions of the Act and Building Code in Dispute

Act: subsections 8(2.2) and (2.3)

Decision

(2.2) When an application for a permit contains the prescribed information, the chief building official is required to determine within the period prescribed by regulation whether to issue the permit or to refuse to issue it.

Same, reasons for refusal

(2.3) If the chief building official refuses to issue the permit, he or she shall inform the applicant of all of the reasons for the refusal of the permit and shall do so within the period prescribed by regulation.

Building Code:

Division C, Article 1.3.1.3. Period Within Which a Permit is Issued or Refused

(1) Subject to Sentences (2) and (3), if an application for a permit under subsection 8 (1) of the Act that meets the requirements of Sentence (5) is submitted to a *chief building official*, the *chief building official* shall, within the time period set out in Column 3 of Table 1.3.1.3. corresponding to the class of *building* described in Column 2 of Table 1.3.1.3. for which the application is made,

(a) issue the permit, or

(b) refuse to issue the permit and provide in writing all of the reasons for the refusal.

Table 1.3.1.3.
Period Within Which Permit Shall be Issued or Refused

Forming Part of Article 1.3.1.3.

Column 1	Column 2	Column 3
Row Number	Class of *Building*	Time Period
1	(a) A detached house, semi-detached house, townhouse, or row house where no *dwelling unit* is located above another *dwelling unit*. (b) A detached structure that serves a *building* described in Clause (a) and does not exceed 50 m^2 in *building area*. (c) A tent to which Section 3.14. of Division B applies. (d) A sign to which Section 3.15. of Division B applies.	10 days
2	(a) *Buildings* described in Clause 1.1.2.4.(1)(a), (b) or (c) of Division A, other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* that do not exceed 600 m^2 in *building area*.	15 days
3	(a) *Buildings* described in Clause 1.1.2.2.(1)(a), or (b) of Division A, other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* exceeding 600 m^2 in *building area*.	20 days
4	(a) *Post-disaster buildings*. (b) *Buildings* to which Subsection 3.2.6. of Division B or any provision in Articles 3.2.8.3. to 3.2.8.11. of Division B applies.	30 days

3. Applicant's Position

The Applicant submitted that two building permit applications were submitted to the City of Greater Sudbury on August 19, 2008 with a cheque for the permit fees. The Applicant stated that the applications, including all fees, drawings and appropriate forms were submitted and accepted by the City Clerk at that time.

The Applicant informed the Commission that the permit application proposed the construction of two duplex dwellings and therefore, there was a 15 day time frame for the Respondent to either refuse the permit application with reasons or to issue the permit.

The Applicant maintained that he had not received a written determination from the Respondent regarding his application for the building permits. He conceded that he had received a letter dated August 29, 2008 from the Supervisor of Development Engineering of the City of Greater Sudbury, which provided comments regarding the lot grading plan. The Applicant advised that this letter was not from the Chief Building Official, did not mention the refusal to issue building permits and as such, did not deem the August 29, 2008 letter to be the written refusal for the permits.

The Applicant asserted that the time frame for the Respondent to respond to the permit application was 15 days and that the Respondent had neither issued the building permit nor refused to issue the building permit within this specified time frame.

4. Respondent's Position

The Respondent participated in the hearing by way of teleconference and submitted that two permit applications from the Applicant were received on August 19, 2008.

The Respondent confirmed that the subject building permit applications included a cheque for the permit fees. The Respondent also maintained that at the time of paying for a permit, an

applicant is given a form which verifies his/her payment and offers a summary of the information in the computer system obtained from the standardized application form. The Respondent stated that at this time, a check list of items requiring approval and/or submission prior to a building permit being issued is given to the permit applicant. The Respondent submitted that one of the required approvals to be completed prior to issuing the subject building permits was the "Sudbury Roads & Drainage" section.

The Respondent explained that the comments for the City of Greater Sudbury "Roads & Drainage" section are provided by the "Development Engineering Section". Its role is to provide comments on such areas as: compliance on grading, storm water management, connections to existing sewer and water infrastructure, as well as roads for the proposed development among other things.

The Respondent stated that as per Division C, Article 1.3.1.3. of the 2006 Building Code, the City of Greater Sudbury had 15 business days to make a determination on the Applicant's building permit applications and in this case that date would be September 9, 2008.

The Respondent submitted that the City of Greater Sudbury Roads & Drainage section reviewed the Applicant's two building permit applications and did not approve the submissions. The Respondent reported that the Applicant was advised by way of a letter dated August 29, 2008 of the deficiencies. The Respondent maintained that the response to the Applicant was thus given within 8 working days.

The Respondent added that on September 30, 2008, the Applicant had subsequently made a second submission to the Roads & Drainage section through the building permit process. This new submission was reviewed by the Roads & Drainage section and was also deemed unacceptable. The Respondent reported that the Applicant was informed by way of a letter dated October 10, 2008 which included reasons for the deficiencies, which was again provided within 8 working days. The Respondent stated that the clearance for the Road & Drainage section is deemed to be "Applicable Law" and as such, the permits can not be issued until the proposed construction is deemed acceptable by the Development Engineering Section.

In summation, the Respondent asserted that the City of Greater Sudbury had met its obligation with respect to the legislated time frame for permit processing. He reiterated that the time period for making a determination regarding the Applicant's building permit application was 15 days and that the time frame began on August 19, 2008 and ended on August 29, 2008 with the letter from the Development Engineering Section. He asserted that the letter detailing the reason for non-issuance of the building permit was sent to the Applicant on August 29, 2008, 8 working days from the time the permit applications were made. Therefore, the municipality had fully complied with the time frames prescribed by the Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the Respondent has not complied with the requirements of Subsections 8(2.2) and 8(2.3) of the *Building Code Act, 1992* and Division C, Sentence 1.3.1.3.(1) of the Building Code. Under these subsections, the Respondent is required to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal, within the applicable time period set out in Table 1.3.1.3. of the Building Code.

6. Reasons

i) Division C, Sentence 1.3.1.3.(6) of the Building Code specifies when the time periods

set out in Table 1.3.1.3. commence:

The time period described in Sentences (1) to (3) shall begin on the day following the later of

(a) the day on which an application meeting the requirements of Sentence (5) is submitted to the chief building official, and

(b) the day on which payment is made of all fees that are required, under a by-law, regulation or resolution made under Clause 7 (1) (c) of the Act, to be paid when the application is made.

The parties agreed that two permit applications were submitted to the City of Greater Sudbury on August 19, 2008.

As a result, it is August 20, 2008 (the day following the day on which an application meeting the requirements of Sentence (5) is submitted) that the applicable time period set out in Table 1.3.1.3. commenced in this case.

ii) The construction proposed under the building permit applications in question are subject to the fifteen day time period set out in Column 3 of Row 2 in Table 1.3.1.3. of Division C. Sentence 1.3.1.3.(7) provides that the time periods described in Column 3 of Table 1.3.1.3. do not include Saturdays, holidays and all other days when the offices of a principal authority are not open for the transaction of business with the public.

In the present case, the applicable fifteen day time period ended on September 10, 2008. The Respondent was required to issue or refuse to issue the permits in respect of the Applicant's permit applications by that date.

iii) The Respondent submitted that a letter detailing the reasons for not issuing the building permits was mailed to the Applicant on August 29, 2008. The letter was signed by Robert Webb P.Eng., Supervisor of Development Engineering of the City of Greater Sudbury. The Applicant agreed that he received the subject letter dated August 29, 2008 before the fifteen day timeframe but disputed whether the letter provided in writing all the reasons for refusing to issue the permits, as required by Article 1.3.1.3 of Division C of the Building Code.

iv) Division C, Sentence 1.3.1.3.(1) of the Code requires the Chief Building Official to, within fifteen days of receipt of a building permit application meeting the requirements of Sentence 1.3.1.3.(5) of the Code, either issue the permit or <u>provide all written reasons as to why the permit cannot be issued</u> (emphasis added).

Under Subsection 8(2) of the *Building Code Act, 1992*, a Chief Building Official shall issue a permit unless certain reasons prevent him/her from doing so. It is the Commission's opinion that the subject letter dated August 29, 2008 did not state the permits were refused, nor did the subject letter provide the Applicant the reasons as to why the permits could not be issued. The subject letter, dated August 29, 2008, sent to the Applicant by the Development Engineering section of the City of Greater Grand Sudbury stated, "The Development Engineering section has reviewed the Lot grading Plan submitted to us for review and wish to provide the following comments…" The subject letter: did not reference either building permit applications made by the Applicant, did not state that the permit applications were being denied, and further did not provide the reasons for refusal of the permit applications.

Dated at Toronto this **17th** day in the month of October in the year **2008** for application number **P-2008-33.**

Yaman Uzumeri, Chair Designate

Ruling No. 08-32-1206
Application No. 2008-28

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF with Articles 9.8.8.5. of Regulation 403/97 and Article 9.8.8.6. of Regulation 350/06 as amended, (the Building Code).

AND IN THE MATTER OF an application by Jerry Skubel, Jerry Skubel Construction, for the resolution of a dispute with Rolf Weins, Chief Building Official, Town of Niagara-on-the-Lake, to determine whether the guards installed to serve the newly constructed rear deck and front entrance landing of a residential building, where the new guards have been designed to replicate the existing guards provide sufficiency of compliance with Articles 9.8.8.5. of the 1997 Building Code or Article 9.8.8.6. of the 2006 Building Code, at 428 Queens St., Niagara on the Lake, Ontario.

APPLICANT	Jerry Skubel Jerry Skubel Construction Toronto, ON
RESPONDENT	Rolf Weins Chief Building Official Town of Niagara-on-the-Lake
	Keegan Gennings Deputy Chief Building Official Town of Niagara-on-the-Lake **Designate for the Respondent**
PANEL	Tony Chow, Chair Rick Florio Neal Barkhurst
PLACE	Toronto, Ontario
DATE OF HEARING	October 9, 2008
DATE OF RULING	October 9, 2008
APPEARANCES	Keegan Gennings Deputy Chief Building Official Town of Niagara-on-the-Lake **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant applied for two building permits under the 1997 Building Code and one building permit under the 2006 Building Code to renovate and construct an addition to an existing residential dwelling.

The subject building is a Group C, 2 ½ storey residential dwelling, approximately 214 m² in area which was built in 1893.

The construction in dispute involves the design of the installed guards, which were built to serve the newly constructed rear deck and front entrance landing of the subject building. The guards are required guard under the Building Code, as the difference in grade is in excess of 600 mm. The new guards have been designed to replicate the existing guards located on the upper balconies of the home. The guard is composed mostly of vertical wooden members; however sections of the guard are constructed with numerous joined diagonal members forming a lattice type design.

It is the opinion of the Respondent that the lattice or "x" design which forms part of the guard, contravenes both Articles 9.8.8.5. of the 1997 Building Code and Article 9.8.8.6. of the 2006 Building Code. It is the Applicant's objective to preserve the original detail in the restoration work undertaken of their historical home.

2. Provisions of the Building Code in Dispute

9.8.8.5. Design to Prevent Climbing (1997 Building Code)

(1) *Guards* required by Article 9.8.8.1. and serving *buildings of residential occupancy* shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2ft 11 in) above the floor or walking surface protected by the *guard* will facilitate climbing.

9.8.8.6. Design to Prevent Climbing (2006 Building Code)

(1) *Guards* required by Article 9.8.8.1., except those in *industrial occupancies* and where it can be shown that the location and size of openings do not represent a hazard, shall be designed so that no member, attachment or opening will facilitate climbing.

(2) *Guards* shall be deemed to comply with Sentence (1) where any elements protruding from the vertical and located within the area between 140 mm and 900 mm above the floor or walking surface protected by the *guard*,

(a) are located more than 450 mm horizontally and vertically from each other,

(b) provide not more than 15 mm horizontal offset,

(c) do not provide a toe-space more than 45 mm horizontally and 20 mm vertically, or

(d) present more than a 1-in-2 slope on the offset.

3. Applicant's Position

The Agent for the Applicant advised that the subject building was constructed in 1893. The Agent stated that the current owners, who use the home as their own private dwelling, have taken great care to preserve the original detail of the home in all the restoration and new

construction work that has taken place. The Agent explained that the newly installed guards serving the rear deck and the front entrance of the home are at the center of this dispute.

The Agent, pointing to photos, explained that the newly constructed guards were designed with a lattice or “x” design forming part of the guard, where the “x” pattern alternates with segments of vertical members. The guards were designed in this manner in order to replicate the design of the existing guards located on the upper balconies of the home. The Agent also added that the small sections of guard that contain the “x” pattern, not only provide a consistent design with the existing guards but also added visual appeal.

Although the Agent conceded that the newly installed guards were not in compliance with the Code, he submitted that his clients felt it would greatly spoil the look to have to add Plexiglas panels over the lattice inserts or to remove the lattice panels altogether.

In response to questions, the Agent stated that the rear deck and front entrance landing and stairs were newly constructed and that previously no other deck or landing had existed in its place. The Agent, also in response to questions, stated that the home was not designated a “heritage building” as it was just outside the boundary for the designation.

4. Respondent’s Position

The Designate for the Respondent submitted that there were three building permits issued for the subject property, one of which was under the 2006 Building Code and the other two were issued under the 1997 Building Code and therefore, both Codes were applicable to the dispute at hand. The Designate also pointed out that the technical requirements of Article 9.8.8.5. of the 1997 Building Code and Article 9.8.8.6. of the 2006 Building Code regarding the design of guards “to prevent climbing” were virtually the same.

The Designate submitted that the guards in dispute formed part of the railing system at the rear deck and front deck of the subject home. In response to questions the Designate indicated the deck floors were approximately 889 mm above grade. The Designate stated the new guards were designed to match the original existing guards of the home. In his opinion the “x” design in the panel inserts of the guards create openings that could enable children in gaining a foothold and therefore, facilitate climbing.

The Designate submitted that the “x” pattern created openings that were located between 100 mm and 900 mm above the walking surface of the deck and that the size of the openings were approximately 95 mm by 222 mm. Therefore, it was his opinion that the subject design could facilitate climbing and did not comply with either Article 9.8.8.5. of the 1997 Building Code or Article 9.8.8.6. of the 2006 Building Code.

Further, the Designate maintained that as the rear deck and front deck of the subject home were newly constructed and were not part of the existing building, he did not believe Article 11.3.3.1 of the 1997 and 2006 Building Code, Basic Renovation, was applicable in this case.

5. Commission Ruling

It is the Decision of the Building Code Commission that the guards, installed to serve the newly constructed rear deck and front entrance landing where the new guards have been designed to replicate the existing guards, do not provide sufficiency of compliance with Articles 9.8.8.5. of the 1997 Building Code or Article 9.8.8.6. of the 2006 Building Code, at 428 Queens St., Niagara-on the-Lake, Ontario

6. Reasons

i) Clause 9.8.8.1.(1)(a) of the 2006 Building Code and Sentence 9.8.8.1.(1) of the 1997 Building Code both require that exterior landings, porches, balconies etc… be protected by a guard on each side that is not protected by a wall where there is a difference in elevation of more than 600 mm between the walking surface and the adjacent surface. Therefore, as there is a difference in elevation of more than 600 mm between the walking surface of both the rear deck and the front entrance landing and the adjacent surface, the subject guards are required guards as per the Building Code.

ii) The Commission heard testimony that the rear deck and the front entrance landing, where the subject guards are located, were not existing structures but rather were newly constructed and added to the existing building. Therefore, Article 11.3.3.1 of the 1997 and 2006 Building Code, Basic Renovation, is not applicable in this case.

iii) Clause 11.3.2.1.(1)(b) in the 1997 and in the 2006 Building Code states, “Where an existing *building* is extended… b) the extended portion of the *building* shall comply with all other Parts”. Therefore, by virtue of Clause 11.3.2.1.(1)(b), Article 9.8.8.5. of the 1997 Building Code or Article 9.8.8.6. of the 2006 Building Code is applicable in this case.

iv) The Building Code sets out the minimum construction requirements. The subject guards do not provide sufficiency of compliance with Article 9.8.8.5 of the 1997 Code or Article 9.8.8.6 of the 2006 Building Code. The Applicant did not offer any compensating measures to offset the deviation from the Code requirement.

APPLICANT	Daniel Cayouette Conseil Scolaire De district Catholique Centre-SUD North York, ON
RESPONDENT	Mike Mantesso Chief Building Official City of Welland
PANEL	Tony Chow, Chair Rick Florio Neal Barkhurst
PLACE	Toronto, Ontario
DATE OF HEARING	October 9, 2008
DATE OF RULING	October 9, 2008
APPEARANCES	Glen Good Glen Good Consultants Toronto, ON **Agent for the Applicant** Mike Mantesso Chief Building Official City of Welland **The Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for a permit under the *Building Code Act*, *1992*, to construct a Secondary School at 620 River Road, Welland, Ontario.

The subject building is a one storey building having a Group A, Division 2 major occupancy and a building area of approximately 5450 m². The subject building is comprised of non-combustible construction and is equipped with both a fire alarm system and a sprinkler system.

The construction in dispute involves whether the proposal to include administrative offices and library spaces within the same fire compartment as the cafetorium, which has an occupant load greater than 200 persons provides sufficiency of compliance with Clause 3.3.2.2.(8)(b) of Division B of the 2006 Building Code.

2. Provisions of the Building Code in Dispute

3.3.2.2. Fire Separations

(8) Except as required in Sentence (9), in an elementary or secondary school, where the *occupant load* of a room exceeds 200 persons, the room and any ancillary rooms of a complementary use shall be separated from the remainder of the *building* by a *fire separation* having a *fire-resistance rating* not less than,

(b) 30 min where the *building* is *sprinklered*.

3. Applicant's Position

The Agent for the Applicant submitted that the nature of the dispute is centered around Clause 3.3.2.2.(8)(b) of Division B of the Building Code. He reported the main issue being disputed is how to define the word "room" as it relates to the proposed secondary school design.

The Agent explained that the Architect has designed a large cafetorium where the occupant load is expected to be greater than 200 persons however; this space will not be defined by continuous enclosing walls. Rather, the cafetorium will open into the main entrance foyer, main circulation corridor, small chapel, washrooms, administrative offices and library. The intent of this configuration is to provide an unobstructed flow and use of the spaces for the students, staff and faculty.

The Agent maintained that for security and privacy purposes only, some of the library and administrative office spaces have been enclosed with non-fire rated partitions. The Agent put forth the argument that all the above-stated rooms could be considered ancillary to each other and to the cafetorium and therefore, would not be required to be separated from the cafetorium by a fire separation having a rating of not less that 30 minutes.

The Agent confirmed that the Chief Building Official has permitted all of the stated spaces, except for the administrative offices and library to be included as part of the cafetorium's fire compartment that would be defined by a 30 minute fire separation. The Agent submitted that the Applicant was requesting the Commission to consider the inclusion of the administrative offices and library into the cafetorium's fire compartment as illustrated in the Main Floor Plan drawing (see Exhibit 1).

The Agent stated that although the Applicant has chosen to enclose the administrative offices and library space, Sentence 3.3.1.9.(5) would permit these occupancies to be within the main corridor space. Based on this premise, he suggested that if these areas were left unenclosed they would automatically connect to the cafetorium space and therefore, by default be considered part of the same room, resulting in a large unenclosed room similar to the configuration being proposed.

The Agent reported, that the proposed floor plan clearly indicates that the occupants in the cafetorium, chapel, administrative offices and library have easy access to numerous egress and exiting facilities including the main entrance doors. Further, the Agent advised that the distance from any point in the floor area to an exit when measured along the path of travel does not exceed 45 m, as per Article 3.3.2.5. The strategic placement of the administrative office also offers a high level of supervision and the capability to monitor the activities and the congregating of students in the over all floor area being discussed. The Applicant suggests that all these factors provide sufficiency of compliance with the Building Code and meet the intent of the Objectives and Functional Statements by minimizing the exposure to personal injury in the event of a fire or other type of emergency.

4. Respondent's Position

The Respondent confirmed that much of the subject dispute revolves around the term "room" and whether or not the administrative and library spaces can be included in the same fire compartment as the cafetorium.

The Respondent submitted that the architect has designed the cafetorium as a room with an occupant load of over 200 persons and therefore, as per Clause 3.3.2.2.(8)(b) of Division B of the Building Code, a 30 minute fire separation is required.

The Respondent submitted that he does not agree that the library, administrative offices and associated corridors can be considered ancillary to the cafetorium, as he is not of the opinion that these spaces provide a supportive or complementary use to the cafetorium. He further explained that these rooms will be used at different times of day and at night and further; the library and administrative offices support the entire building and not specifically the cafetorium.

The Respondent agreed with the Agent's statement that the distance from any point in the floor area to an exit measured along the path of travel does not exceed 45 m, as per Article 3.3.2.5. However, he maintained that the library space and administrative offices were not, in his opinion, ancillary to the cafetorium and therefore, the cafeteria must be separated from the remainder of the building by a fire separation having a fire-resistance rating of 30 minutes in order to comply with the Clause 3.3.2.2.(8)(b) of the Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposal to include the administrative offices and library spaces within the same fire compartment as the cafetorium, which has an occupant load greater than 200 persons does not provide sufficiency of compliance with Clause 3.3.2.2.(8)(b) of Division B of the Ontario Building Code at Ecole Secondaire Catholique Jean Vanier, 620 River Road, Welland, Ontario.

6. Reasons

i) Clause 3.3.2.2.(8)(b) of the Building Code states, “Except as required in Sentence (9), in an elementary or secondary school, where the *occupant load* of a room exceeds 200 persons, the room and any ancillary rooms of a complementary use shall be separated from the remainder of the *building* by a *fire separation* having a *fire-resistance rating* not less than…(b) 30 min where the *building* is *sprinklered*.”

Sentence 1.4.1.1.(1) of the Building Code states, “Definitions of words and phrases used in this Code that are not included in the list of definitions in Articles 1.4.1.2. and 1.4.1.3. and are not defined in another provision of this Code shall have the meanings that are commonly assigned to them in the context in which they are used, taking into account the specialized use of terms by the various trades and professions to which the terminology applies”.

The Canadian Oxford Dictionary defines “ancillary” as: 1 (of a person, activity, or service) providing essential support to a central service or industry. 2. associated secondary. It is the Commission’s opinion that the library and suite of administrative offices are not ancillary to the cafetrorium. Therefore, the proposal to include the administrative and library spaces in the same fire compartment as the cafetorium does not provide sufficiency of compliance with Clause 3.3.2.2.(8)(b) of the Building Code.

iii) The intent of Sentence 3.3.2.2.(8) is to reduce the probability of fire spreading from one part of the building to the high occupant room which could lead to harm to persons. The proposed design of this secondary school includes a large cafetorium with an occupant load greater than 200 persons. Therefore, it is the Commission’s opinion that the proposed design of this secondary school does not meet thee intent of Sentence 3.3.2.2.2(8) of the Building Code, and further, that the cafeteria be separated from the remainder of the building by a fire separation having a fire-resistance rating of 30 minutes.

iv) The Building Code sets out the minimum construction requirements. The Applicant did not offer any compensating measures to offset the deviation from the Code requirement.

RULING

1. Particulars of Dispute

The Applicant has applied for a permit under the *Building Code Act*, *1992*, to construct a retail complex at Boxgrove East Commercial Campus, Markham, Ontario.

The retail complex includes ten buildings in total on a single property. The largest building measures approximately 18 593 m² in floor area and nine additional smaller buildings ranging in size from 3344 m² to 464 m².

The construction in dispute involves whether the proposed system of piping to be built in conformance with Article 7.1.5.5. of the Building Code, which includes connections to multiple buildings on a single property that will be serviced by a single connection between the private sewer and the public sanitary sewer and two connections between the private water supply and the public water supply, sufficiently complies with Article 7.1.5.4. of the 2006 Building Code.

2. Provisions of the Building Code in Dispute

7.1.5.4. Separate Services

(1) Piping in any *building* shall be connected to the public services separately from piping of any other *building*, except that an ancillary *building* on the same property may be served by the same service.

7.1.5.5. Private Sewers and Private Water Supply

(1) *Private sewers* and *private water supply* pipes shall be installed according to MOE, "Guidelines for the Design of Sanitary Sewage Systems, Guidelines for the Design of Storm Sewer Systems, Guidelines for the Design of Water Distribution Systems and Guidelines for Servicing in Areas Subject to Adverse Conditions".

3. Applicant's Position

The Agent for the Applicant submitted that Sentence 7.1.5.4.(1) of the 2006 Building Code requires piping in any building to connect to the public sewer and water supply separately from the piping of any other building with the exception of an ancillary building located on the same property. The Agent explained that there are ten buildings in total proposed for the subject

property, which consist of one main building measuring approximately 18 593 m² in floor area, and nine other smaller buildings, ranging in size from 3344 m² to 464 m². The Agent argued that as per the Oxford definition, the nine smaller buildings can be considered ancillary to the main building in the retail complex, as the smaller buildings are deemed to be additional to or supplementary to the main building.

The Agent explained that the subject buildings would be connected separately to a shared private water service pipe, sanitary building sewer and storm sewer, which in turn would be connected to the municipal service. He argued that Sentence 2.1.2.1.(1) and Appendix II of the National Plumbing Code, permits multiple buildings to be connected to a public service using a shared connection within the same property line. He asserted that the intent of these code provisions ensures that each property owner is responsible for the repair of his/her own sewers and water services.

The Agent also submitted that Appendix A for Sentence 7.1.5.4.(1) of the 2006 Building Code suggests that a combined connection from buildings on adjacent properties is permitted provided there is an agreement with the municipality registered on title. The Agent maintained that the intent of Sentence 7.1.5.4(1) is to minimize the impact of damage if a sewage backup occurs or if a problem arises as a result of servicing or repair of water or sewage mains across property lines. He contended that these provisions intend to ensure that each property owner will be responsible for the repair of his/her own sewers and water services. The Agent argued that the ten buildings subject to this dispute all reside on one single property under a common ownership and therefore, their common connection to the municipal service does not contravene the intention of the Building Code.

Further, the Agent stated that the proposed retail complex ownership will be governed by a lease agreement, which will be registered on title and will clearly state that: a) all common services and buildings will be maintained under the Lessor's single ownership and b) the owner will be responsible for the repairs and maintenance of the services to each building within the site. In addition, the Agent advised that the site plan agreement will include language stipulating that the owner of the property shall be responsible for the maintenance and repair of the shared water, sewer and storm services located on the subject property. Therefore, the Agent argued, by entering into the lease agreement, the Lessees will acknowledge and accept the configuration of the service system.

The Agent also submitted that Sentence 7.1.5.5.(1) of the Ontario Building Code introduces the concept of private sewers and private water supply which permits systems that conform to the guideline set out by the Ministry of Environment (MOE), ensuring the private system is of sufficient capacity, depth and orientation to serve a given property. He stated that in fact, the proposed private water service pipe, sanitary building sewer and storm building sewer are of sufficient capacity, depth and orientation to service the subject property and further, conform to the MOE Guidelines for the design of private systems as referenced in 7.1.5.5.(1) of the Code. In addition, the Agent suggested that further clarity regarding the relationship between Building Code Articles 7.1.5.4 and 7.1.5.5. would be useful in addressing the situation in dispute.

Providing examples, the Agent stated that common connection of multiple buildings on a single property is accepted by municipalities across Ontario and have demonstrated past performance. The Agent asserted that multiple service connections from buildings on a single property are inefficient; add significantly to infrastructure costs, while not measurably improving the protection available to the building occupants. He further argued that a shared connection is more desirable from an environmental point of view, as there is less piping, fewer connections, and fewer maintenance issues and consolidated metering. Therefore, the Agent asserted that a single connection to municipal services for multiple buildings on a single property provides sufficiency of compliance with the Building Code.

4. Respondent's Position

The Respondent submitted that the subject development consists of ten individual buildings located on a single lot and the proposal to connect the water, sanitary and storm piping, serving each of the buildings to a private water, sanitary and storm facility does not comply with Sentence 7.1.5.4.(1) of the 2006 Ontario Building Code, as the water, sanitary and storm piping of each building is not connected to the public (municipal) service separately from every other building as required by Sentence 7.1.5.4.(1).

Although the Respondent acknowledged that Sentence 7.1.5.4.(1) permits ancillary buildings to be interconnected with the main building it serves, he stated that in his opinion, the subject buildings were not ancillary to one another.

The Respondent stated that although Sentence 7.1.5.5.(1) of Division B references guidelines for the installation of private sewers and private water supply pipes, there is no provision in the Code that over-rides the requirement of Sentence 7.1.5.4.(1) of the Code. Further, the Respondent argued that the Appendix note to Sentence 7.1.5.4.(1) does not apply to the proposed design at dispute, as all the buildings in the proposal are situated on a single property. Further, the Respondent maintained that in his opinion, the agreements or contracts contemplated in the Appendix note for Sentence 7.1.5.4.(1), can not amend a statutory requirement.

However, the Respondent also submitted that the municipality was not averse to the subject proposal and that they also recognized that compliance with Article 7.1.5.4. of the Code would, in many cases, be impractical, wasteful and unnecessary. He further added that although service to one building may be impacted by an interruption in the service to another building, provided the buildings and the shared services are maintained under a single ownership or are managed under the terms of a condominium plan, such sharing of services could be considered to sufficiently comply with the Building Code. The Respondent added that a Code amendment permitting such designs in these circumstances would be supported by the municipality.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposed system of piping to be built in conformance with Article 7.1.5.5. of the Building Code, which includes connections to multiple buildings on a single property that will be serviced by a single connection between the private sewer and the public sanitary sewer and two connections between the private water supply and the public water supply, sufficiently complies with Article 7.1.5.4. of the 2006 Building Code at Boxgrove East Commercial Campus, Copper Creek Drive, and Markham By-pass, Markham Ontario.

6. Reasons

i) Article 7.1.5.5. of the 2006 Building Code states, "*Private sewers* and *private water supply* pipes shall be installed according to MOE, "Guidelines for the Design of Sanitary Sewage Systems, Guidelines for the Design of Storm Sewer Systems, Guidelines for the Design of Water Distribution Systems and Guidelines for Servicing in Areas Subject to Adverse Conditions". The Commission was advised that the water service pipe, sanitary sewer and storm sewer are of sufficiently capacity, depth and orientation to service the subject property and also conform to the MOE Guidelines, thereby fully complying with Article 7.1.5.5 of the Building Code.

ii) The Commission was advised that the site plan agreement will include language stipulating that the owner of the property shall be responsible for the maintenance and repair of the shared water, sewer and storm services located on the subject property.

iii) The Commission was advised that the lease agreement, governing the retail complex, will clearly state that the owner shall be responsible for the repairs and maintenance of the shared water, sewer and storm services located on the subject property and that the lease agreement shall be registered on title.

iv) The Commission heard evidence and testimony that the common connection of multiple buildings on a single property is accepted by municipalities across Ontario and has demonstrated satisfactory past performance.

v) It is the Commission's opinion, when considering the above measures, that the intent of Article 7.1.5.4. has been satisfied.

APPEARANCES	Nathan Patry (by teleconference) Patry Inc. Development St. Thomas, ON **The Applicant** Jim Foster (by teleconference) Chief Building Official City of St. Thomas **The Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Order to Comply under the *Building Code Act*, *1992*, to remedy certain alleged code deficiencies at 268 – 274 Talbot Street, St. Thomas, Ontario.

The subject building is a 3 storey, residential building of combustible construction with a building area of 836 m², which the Applicant has received a permit to renovate.

The construction in dispute relates to the continuity of the wood studs used to construct the non-load bearing public corridor walls on the second and third floors of the subject building. Sentence 9.23.10.4.(1) of the Building Code requires wall studs to be continuous for the full storey height except at openings and shall not be spliced except by finger-jointing with a structural adhesive.The Applicant in this case has installed the wood stud walls using butt jointed studs. The Respondent believes the as-constructed wood stud walls do not comply with this Code requirement.

2. Provisions of the Building Code in Dispute

9.23.10.4. Continuity of Studs

(1) Wall studs shall be continuous for the full *storey* height except at openings and shall not be spliced except by finger-jointing with a structural adhesive.

3. Applicant's Position

The Applicant submitted that during a similar project in the past a spliced 2 by 4 wall had been constructed due to the availability of material on site and the fact that the wall was non-load bearing. The Applicant further explained that on his engineer's advice and stamped letter, wood blocks with a construction adhesive were used to make the studs continuous and in this circumstance, it had been accepted and approved by the municipality. The Applicant contended that during the subject renovation, he similarly constructed the wall as was done previously expecting the municipality's approval.

The Applicant argued that he had submitted to the Respondent an engineered stamped letter verifying the structural adequacy of the wood stud walls, where butt jointed studs were used in the non-load bearing public corridor walls on the second and third floors of the subject building.

The Applicant advised the Commission that the subject walls have been built to the specification of Wall Number W4a, as described in Supplementary Standard SB-3 of the Building Code and that the W8b wall assemblies originally indicated on the original permit drawings submitted to the Municipality had since been substituted for W8b wall assemblies.

The Applicant argued that based on the engineer's stamped drawings, it was his opinion that the as-constructed butt jointed wood stud wall sufficiently complied with Article 9.23.10.4 of the Building Code.

4. Respondent's Position

The Respondent submitted that the as-constructed wood stud walls did not comply with Article 9.23.10.4 of the Building Code as they were not continuous for the full storey height. He further submitted that the as-constructed walls do not fully correspond to any of the wall assemblies

listed in the Supplementary Standards in Volume 2 of the Building Code.

The Respondent maintained that the as built wall assemblies were contrary to the plans for which a permit had been issued. He argued that the public corridor walls were in his opinion, considered to be an untested assembly and as such, was concerned about the fire resistance rating and STC rating for soundproofing of the public corridors.

5. Commission Ruling

It is the Decision of the Building Code Commission that the as-installed wood stud walls, where butt jointed studs have been used in a non-load bearing wall on the 2nd and 3rd storey public corridors of a 3 storey residential building, provide sufficiency of compliance with Sentence 9.23.10.4.(1) of Division B of the 2006 Building Code at 268 – 274 Talbot Street, St.Thomas, Ontario.

6. Reasons

i) The Commission was presented with evidence and testimony that the subject walls have been built to the specification of Wall Number W4a, as described in Supplementary Standard SB-3 of the Building Code and that the W4a wall assemblies have been substituted for the W8b wall assemblies indicated on the original permit drawings submitted to the Municipality.

ii) The Commission heard that the subject walls are non-load bearing walls and that butt jointed studs have been used to make up a very short length to obtain the required wall height.

iii) A drawing submitted under seal by a professional engineering consultant confirmed that the structural integrity of the butt jointed wood studs used in the subject wall assemblies provide the equivalent performance level as continuous wood studs required by Sentence 9.23.10.4.(1) of the Building Code.

APPEARANCES	Robert McNeil McNeil Engineering & Construction Inc., Acton, ON **Agent for the Applicant** Mike Moore Plan Examiner City of Toronto **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an order to comply under the *Building Code Act*, *1992*, to remedy to certain alleged code at 283 Horner Ave., Toronto, Ontario.

The subject building is an existing, single storey, sprinklered non-combustible building. The building is classified as a Group F, Division 3, Industrial Occupancy and is currently used as a food processing plant.

The construction in dispute involves the installation of CPVC Sch 80 pressure pipe and fittings in an underground sanitary drainage system. Article 7.2.5.9. of the Building Code, lists the acceptable certified CPVC pipe, fittings and solvent cements to be used in hot and cold water supply services. However, the Code does not list the subject piping for use in a sanitary drainage system.

Article 7.2.5.9. of the Code lists the types of plastic pipe fittings and solvent cement that can be used in a drainage system. The issue at dispute between parties is whether the installation of the CPVC Sch 80 pipe as an alternative to the ABS PVC prescribed by Article 7.2.5.9. of the Code sufficiently complies with Article 7.2.5.9. of the Code.

2. Provisions of the Building Code in Dispute

7.2.5.9. Plastic Pipe, Fittings and Solvent Cement Used Underground

(1) Plastic pipe, fittings and solvent cement used underground outside a building or under a building in a drainage system shall be certified to

- (a) CAN/CSA-B181.1, "ABS Drain, Waste, and Vent Pipe and Pipe Fittings",
- (b) CAN/CSA-B181.2, "PVC Drain, Waste, and Vent Pipe and Pipe Fittings",
- (c) CAN/CSA-B182.1, "Plastic Drain and Sewer Pipe and Pipe Fittings",
- (d) CAN/CSA-B182.2, "PVC Sewer Pipe and Fittings, (PSM Type)",
- (e) CAN/CSA-B182.4, "Profile (Ribbed) PVC Sewer Pipe and Fittings",
- (f) CAN/CSA-B182.6, "Profile Polyethylene Sewer Pipe and Fittings",
- (g) CAN/CSA-B137.2, "PVC Injection-Moulded Gasketed Fittings for Pressure Applications", or
- (h) CAN/CSA-B137.3, "Rigid Poly (Vinyl Chloride) (PVC) Pipe for Pressure Applications".

(2) Except as permitted in Clauses (g) and (h), plastic pipe used as described in Sentence (1) shall have a stiffness equal or greater than 320 kPa (46.4 psi).

3. Applicant's Position

The Agent for the Applicant stated that the subject building was being used as an egg processing plant and that CPVC Sch 80 pressure piping had been installed in an underground drainage application within the building to convey sanitary sewage from the building to the municipal sewer.

The Agent submitted that the Sch 80 piping was in fact, an equivalent if not more durable material than PVC and ABS piping permitted by the Code. The Agent contended that the installed CPVC piping meets the minimum requirements of the Code and that it can adequately handle high temperature wash water, harsh cleaning chemicals and the forces from frequent thermal cycling. The Agent also added that the subject piping was more costly in comparison the

alternatives permitted by the Code and further, because of its performance; the subject piping has been approved and installed in other food processing plants in similar applications.

In support of claims that the subject piping provided reliable long-term performance, the Agent submitted a letter from the manufacturer of the Sch 80 CPVC piping, which supported the suitability of the subject piping being used in this application, as well as a material data sheet from the pipe manufacturer.

The Agent reiterated his belief the as-installed piping provides an equivalent level of performance to the types of piping permitted by the Code. In summary, he stated that sufficiency of compliance had been achieved.

4. Respondent's Position

The Respondent submitted that Article 7.2.5.9. of the 1997 Building Code only permits CPVC piping to be used in hot and cold water supply services but it is not certified for use in a drainage system. The Respondent maintained that without proof of certification for use in a drainage system, CPVC pipe and fittings shall not be installed according to Sentence 7.2.1.4 (2) of the Building Code.

Further, the Respondent argued that the Appendix in the Code and Guide for Plumbing 1997, while not an official part of the Code, provides a Summary of Pipe and Fittings Applications (A-7.2.5. to 7.2.7), which indicates that CPVC water piping is not permitted for use in a Drainage System or Venting System.

The Respondent submitted that the Sentence 7.4.4.1(1) of the Building Code requires sewage or waste to be treated before being discharged into the drainage system to prevent damage to drainage piping and that the subject plumbing system has not been designed accordingly.

In summary, the Respondent maintained that the design, installation and construction of such piping must be in conformance with the Code. He reiterated his belief that the as-installed piping has not been certified for use in a drainage application and therefore, the subject drainage system does not comply with the Code requirements.

5. Commission Ruling

It is the Decision of the Building Code Commission that the as-installed CPVC SCH 80 distribution piping, used in a drainage application in a food processing plant, as an alternative to ABS and PVC piping, does not provide sufficiency of compliance with Article 7.2.5.9. of the 1997 Building Code at 283 Horner Ave., Toronto, Ontario.

6. Reasons

i) Article 7.2.5.9. of the Building Code lists the types of plastic pipe, fittings and solvent cement permitted to be used under the building in a drainage system. CPVC is not listed as a type of piping to be used in an underground drainage system application.

ii) The Guide to the 1997 Building Code, 7.2.5 to 7.2.7, "Summary of Pipe and Fittings Applications" table, although not strictly part of the Building Code, provides a guide for users to assist in complying with the Code requirements. This Guide explicitly states that CPVC is not permitted in an underground drainage system application.

Ruling No. 08-26-1200
Application No. 2007-46

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF s. 8.-(1) of the Building Code Act, regulation 403 as amended, (the 1997 Building Code).

AND IN THE MATTER OF an application by Lorraine Fernicola, Homeowner, for the resolution of a dispute with David Eidsness, Chief Building Official, Town of Gravenhurst, to determine whether the as-constructed "fishing deck" can be considered a "building" that provides sufficiency of compliance with the definition of "building" as outlined in the *Building Code Act*, at 1011 Goldfinch Court, Gravenhurst, Ontario.

APPLICANT	Lorraine Fernicola Homeowner Woodbridge, ON
RESPONDENT	David Eidsness Chief Building Official Town of Gravenhurst
PANEL	Tony Chow, Chair Ed Link Marina Huissoon
PLACE	Toronto, Ontario
DATE OF HEARING	June 19, 2008
DATE OF RULING	June 19, 2008
APPEARANCES	Lorraine Fernicola Homeowner Woodbridge, ON **The Applicant** Bobbi Lovring Town of Gravenhurst **Designate for the Respondent** Michel Cormier Town of Gravenhurst **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Order to Comply under the *Building Code Act*, *1992*, to obtain a permit for the construction of a "fishing deck" at 1011 Goldfinch Court, Gravenhurst, Ontario.

The primary contention between the parties is with respect to the determination of whether the as-constructed "fishing deck" can be considered a "building" as defined by the *Building Code Act*, and further, whether the construction of the "fishing deck" requires a building permit as per s. 8.-(1) of the *Building Code Act*.

2. Provisions of the Building Code in Dispute

No provisions of the Building Code are in dispute.

3. Applicant's Position

The Applicant submitted that the subject "fishing deck" was an existing raised deck that was built in 1981. She stated that some of the deck's wooden boards had rotted over time and therefore, were in need of replacement for safety reasons. She also submitted that she did not believe the wooden deck was a "building", nor did she believe that a building permit was required for the replacement of the rotted wooden boards.

The Applicant described the deck as having an area of approximately 10 feet by 4 feet with 4 steps leading up to it. Further, she explained that the deck extends over a large rock and is approximately 3 to 4 feet above the water, and is located approximately 100 m from the house.

The Applicant maintained that no changes in design, size or structure of the existing deck were made. She submitted that some of the floor boards and some areas of the railing were replaced for safety reasons. She added that the deck's concrete base and steel I-beams were not replaced but were painted for a newer appearance.

The Applicant maintained that as the deck was in existence, and given that only some rotten boards were replaced to make the deck safer, a building permit was not required. Further, she believes the fishing deck cannot be considered a "building".

In response to questioning the Applicant agreed that there was no technical provision of the Building Code currently at dispute between the parties.

4. Respondent's Position

The Respondent submitted that an inspection of the subject property in August 2007 revealed a deck had been constructed at the rear of the property on the water front.

The Respondent submitted that the construction in question was comprised of floor joists, floor decking, stairs without a handrail and guards around the main deck surrounding the floor system with posts. The Respondent maintained that the deck formed a structure greater than 10 square meters in building area as defined by the *Building Code Act*. However, the Respondent stated that no building permit had been obtained by the Applicant. As a result, the Applicant was issued

an Order to Comply for contravention of subsection 8(1) of the *Building Code Act* and was ordered to apply for and obtain a building permit by September 14, 2007.

The Respondent explained that the deck was an existing structure and that material alteration or repair of the deck had taken place. The Respondent maintained that the deck comprised of a floor system greater than 10 m² and therefore, was a "building" as defined by the *Building Code Act* and further, a building permit for the repair or alteration of the deck structure was required.

In response to questioning, the Respondent agreed that there was no technical provision of the Building Code currently at dispute between the parties.

5. Commission Ruling

It is the Decision of the Building Code Commission that, under clause 24(1)(a) of the *Building Code Act, 1992*, the Commission does not have the jurisdiction to make a determination on the issues raised in relation to the matter at 1011 Goldfinch Court, Gravenhurst, Ontario.

6. Reasons

i) Subsection 24(1) of the *Building Code Act, 1992* provides the Building Code Commission (BCC) with the jurisdiction to resolve disputes between a permit applicant, permit holder or a person to whom an order has been issued and the chief building official, a registered code agency or inspector concerning the **sufficiency of compliance with the technical requirements of the Building Code** (emphasis added).

While an Order to Comply has been issued by the municipality to the Applicant, it is an Order which requires the Applicant to obtain a building permit as per subsection 8(1) of the *Building Code Act*. Further, both parties agreed that there were no technical requirements of the Building Code currently at dispute.

ii) The Commission acknowledges that there is a dispute between the Chief Building Official and the Applicant; however, the Commission, as noted above, has a very narrow jurisdiction outlined in subsection 24(1) of the *Act.* Disputes concerning compliance with subsection 8(1) of the *Building Code Act* are not disputes which are identified in subsection 24(1). Therefore, the Commission does not have the jurisdiction to make a determination in this matter.

Dated at Toronto this 7th day in the month of August in the year 2008 for application number 2007-46.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF with Sentence 9.19.1.1.(1) of the Regulation 350/06, as amended, (the 2006 Building Code).

AND IN THE MATTER OF an application by Michael & Connie Pun for the resolution of a dispute with Ann Borooah, Chief Building Official, City of Toronto, to determine whether the proposal to install a roof assembly, where medium density, closed-cell spray polyurethane foam will be installed to insulate the roof, and where no vents will be installed in the roof assembly, provides sufficiency of compliance with Sentence 9.19.1.1.(1) of Division B of the 2006 Building Code at 12 Highland Crescent, Toronto, Ontario.

APPLICANT	Michael & Connie Pun Homeowners Toronto, ON
RESPONDENT	Ann Borooah Chief Building Official City of Toronto
PANEL	Tony Chow, Chair Leslie Morgan Alison Orr
PLACE	Toronto, Ontario
DATE OF HEARING	July 24, 2008
DATE OF RULING	July 24, 2008
APPEARANCES	Cathy Garrido Altius Architecture Inc., Toronto, ON **Agent for the Applicant** Andrew Wild Senior Building Inspector City of Toronto **Designate for the Respondent**

RULING

1. Particulars of Dispute

The subject building is a three storey building, Group C, Residential Occupancy (i.e. single detached dwelling) of combustible construction.

The Applicant has received a building permit under the *Building Code* Act to renovate an existing residential dwelling and is proposing to insulate the third floor attic roof by filling the void space between the roof joists and roof sheathing with medium density, closed-cell spray polyurethane foam without providing any roof venting.

The construction in dispute involves whether the proposal to install an un-vented roof assembly, using a medium density, closed-cell spray polyurethane foam to insulate the roof, provides sufficiency of compliance with Sentence 9.19.1.1.(1) of Division B of the 2006 Building Code at 12 Highland Crescent, Toronto, Ontario.

2. Provisions of the Building Code in Dispute

9.19.1.1. Required Venting

(1) Except where it can be shown to be unnecessary, where insulation is installed between a ceiling and the underside of the roof sheathing, a space shall be provided between the insulation and the sheathing, and vents shall be installed to permit the movement of air from the space to the exterior.

3. Applicant's Position

The Agent for the Applicant stated that the subject home was built 90 years ago and the home was currently undergoing renovations. The Agent submitted that venting was originally planned to be provided when insulating the existing roof in the attic space, part of which is a cathedral ceiling. However, due to site conditions and new spray foam technology, the Agent explained, an un-vented roof assembly was proposed instead.

The Agent asserted that Sentence 9.19.9.9.(1) of the Building Code allows for an un-vented roof assembly when venting "can be shown to be unnecessary" and that this was in fact the case in this circumstance. The Agent argued that a 2 lb, medium density, closed-cell spray polyurethane foam, applied to the void space between the roof joists and roof sheathing, provides an air and vapour barrier and therefore, venting is not required. However, she added that a 6 mil poly vapour barrier and ½ in gypsum board would also be installed. The Agent also informed the Commission that there was a warranty agreement in place with the shingle manufacturer and that the medium density, closed-cell polyurethane foam spray installation would not void the shingle warranty.

Further, the Agent submitted that the subject polyurethane foam spray meets the material standard, CAN/ULC S705.1-01, "Standard for Thermal Insulation Spray Applied Rigid Polyurethane Foam, Medium Density, Material Specification" and is listed in CCMC Evaluation Number 12380-R, which confirms that the product's physical properties and durability are suitable for this application.

In addressing some of the Respondent's concerns regarding the application of the spray foam, the Agent stated that the product must be installed in accordance with the instructions provided by the manufacturer along with the CAN/ULC-S705.2, "Standard for Thermal Insulation Spray

Applied Rigid Polyurethane Foam-Medium Density-Application", which outlines how the subject polyurethane product should be applied onsite. The Agent added that, in accordance with the Application Standard, the installers must be trained and licensed to apply the product in order to ensure that no air spaces will be trapped in the roof assembly. Further, the Agent informed the Commission that the licensed installer would conduct density, adhesion and cohesion substrate verifications and keep a daily work record, including the results of testing in accordance with the Standard, which the Respondent could request to review. The Agent also added that inspections could also be conducted by a third party organization under an independent quality assurance program delivery agent used by CUFCA, the Canadian Urethane Foam Contractors Association Inc.

The Agent also presented a "Branch Opinion" dated May 1997 regarding Section 9.19. of the Ontario Building Code, issued by the Ministry of Municipal Affairs and Housing, which stated, "It is the opinion of the Housing Development & Buildings Branch that, where a roof assembly is filled with rigid insulation (no gaps or empty spaces in between), Subsection 9.19 of the OBC need not apply". The Agent maintained that with a licensed installer the subject foam spray would provide a continuous air barrier.

The Agent concluded that given the above, along with the building science and technology documentation submitted to the Commission, the proposal to install a roof assembly, where medium density, closed-cell spray polyurethane foam will be installed to insulate the roof, and where no vents will be installed in the roof assembly, provides sufficiency of compliance with Sentence 9.19.1.1.(1) of the Building Code, as venting has been shown to be unnecessary in this circumstance.

4. Respondent's Position

The Respondent submitted that the performance level required, in order to omit the ventilation space, can not be obtained when the application of the medium density, closed-cell spray polyurethane foam is performed onsite in an uncontrolled environment. To substantiate this claim, the Respondent submitted a letter, SCH-11, 2307 dated January 27, 2006 received from the National Research Council of Canada (NRC), which expresses this same opinion.

Further, the Respondent submitted a letter dated April 3, 2006 received by the Town of Oakville from the Ministry of Municipal Affairs and Housing, Building and Development Branch, which advises that the insulation installer must prove without doubt to the Authority having jurisdiction, that the installation of the product forms a perfect seal within the assembly, and additionally provide a warranty agreement from the roof shingle manufacturer. The Respondent stated that he was concerned with the application of the product on existing buildings. He stated that, in this case, as the existing structure is old, there are spaces and natural gaps in the rafters. Therefore, it can not be guaranteed to be clean and free of defects. Further, he expressed concerns regarding the overhead application of the spray foam insulation specifically that it was not compatible with the factory application and that gravity could affect its distribution.

The Respondent stated that as a result of the lack of ventilation, the building materials within the roof assembly (i.e. roof sheathing, roof shingles, and roof rafters) may not perform as intended. He concluded that in his opinion, the indoor air quality may be affected if moisture becomes trapped in the assembly and is not able to dry out. He further argued that any trapped moisture would cause the existing roof structure to deteriorate over time.

The Respondent stated that it was his opinion that there is insufficient evidence for this application to justify omitting the air space to satisfy the roof ventilation requirement set out in Sentence 9.19.1.1. (1) of the Building Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposal to install a roof assembly, where medium density, closed-cell spray polyurethane foam will be installed to insulate the roof, and where no vents will be installed in the roof assembly, provides sufficiency of compliance with Sentence 9.19.1.1.(1) of Division B of the 2006 Building Code at 12 Highland Crescent, Toronto, Ontario on condition that:

a) a membrane shall be installed on the warm side of the roof so as to serve as both an air and vapour barrier, and

b) test reports conducted in accordance with Clause 4.3.10 of CAN/ULC-S705.2-05 shall be submitted to the Chief Building Official.

6. Reasons

i) Sentence 9.19.1(1) of the Building Code states, “Except where it can be shown to be unnecessary, where insulation is installed between a ceiling and the underside of the roof sheathing, a space shall be provided between the insulation and the sheathing, and vents shall be installed to permit the movement of air from the space to the exterior”. It is the Commission’s opinion, based on the evidence and testimony presented, that venting in the subject roof assembly has been shown to be unnecessary.

ii) Sentence 9.25.2.5 of Division B of the Building Code requires that spray-applied polyurethane insulation be installed in accordance with CAN/ULC-S705.2-05. The Commission heard that the closed-cell spray polyurethane foam will be installed in accordance with CAN/ULC-S705.2-05 Standard for thermal insulation as referenced by the Code.

iii) CAN/ULC-S705.2-05 Standard requires a licensed installer to perform the application of the subject foam spray. The licensed installer must have successfully completed a training course approved by the manufacturer and the designated Certification Organization. The Commission was advised that in accordance with CAN/ULC-S705.2-05, a licensed installer trained to spray the subject foam insulation would be performing the installation to ensure that no air spaces will be trapped in the roof assembly.

iv) Further, the Commission was advised that a continuous vapour barrier (6 mil poly vapour barrier) would be provided as per Subsection 9.25.4 of the Building Code.

Ruling No. 08-23-1197
Application No. 2008-20

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 9.30.6.3. of the Regulation 403, as amended, (the 1997 Ontario Building Code).

AND IN THE MATTER OF an application by Lou Bada, Foxstar Group Ltd., for resolution of dispute with Leo Grellette, Chief Building Official, City of Vaughan, to determine whether the as-installed ceramic tile flooring, where the ceramic tile has been applied directly to the subfloor with a scratch coat adhesive mortar (thin-set method), on a subfloor of 15.5 mm softwood plywood conforming to CSA 0151 or 15 mm OSB subfloor conforming to CSA 0325 with a reduced joist spacing of 300 mm (12 in.) on centre below the tiled areas, sufficiently complies with Article 9.30.6.3. of the 1997 Ontario Building Code at 32 Emily Anna Street, Vaughan, Ontario.

APPLICANT	Lou Bada Foxstar Group Ltd., Concord, ON
RESPONDENT	Leo Grellette Chief Building Official City of Vaughan
PANEL	Tony Chow, Chair Leslie Morgan Alison Orr
PLACE	Toronto, Ontario
DATE OF HEARING	July 24, 2008
DATE OF RULING	July 24, 2008
APPEARANCES	Lou Bada Foxstar Group Ltd. Concord, ON **The Applicant** Allan Larden Larden Muniak Consulting Inc., Toronto, ON **Agent for the Applicant** Leo Grellette Chief Building Official City of Vaughan **The Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for and received a building permit to construct a two storey detached dwelling, with a building area of 154 m² at 32 Emily Anna Street in Vaughan, Ontario.

The construction in dispute involves the method used for the installation of the ceramic tile in the subject building. The floor areas where ceramic tile has been installed, have been constructed as follows:

- All floor joists supporting the subfloor beneath the ceramic tile were spaced at 12” on center
- The subfloor beneath the ceramic consisted of either 15.5 mm softwood plywood conforming to CSA 0151 or 15 mm OSB subfloor conforming to CSA 0325
- Ceramic tile was applied directly to the subfloor with a scratch coat of adhesive (thin-set method)

Sentence 9.30.6.3.(1) of the 1997 Building Code provides a choice of assemblies to reinforce a floor assembly that supports ceramic tiles set on panel-type wood sheathing. The Applicant has proposed a compliance equivalency in accordance with Section 2.7. of the 1997 Code, which permits materials, systems and building designs other than those authorized under the Code as long as the level of performance is maintained or exceeded. The Applicant claims that the as-installed assembly is equal to or better than the assemblies permitted in the Code. The Chief Building Official has refused to accept the proposed equivalency.

As a result, the Applicant has applied to the Building Code Commission to resolve the issue of whether the as-constructed ceramic tile installation demonstrates sufficiency of compliance with the technical requirements of Sentence 9.30.6.3.(1)

2. Provisions of the Building Code in Dispute

9.30.6.3. Reinforcement for Panel-Type Wood Sheathing

(1) Except as permitted in Article 9.30.6.4., when ceramic floor tiles are set on panel-type wood sheathing, one of the following assemblies for reinforcing the floor assembly shall be used:

(a) 20 mm thick plywood or waferboard with all edges supported by at least 38 mm by 38 mm blocking with floor joists spaced not more than 400 mm o.c., with 6 mm underlay,

(b) sheathing with a thickness that conforms to Table 9.23.14.5.A. or a rating that complies to Table 9.23.14.5.B. and has an underlay consisting of 15.9 mm plywood or waferboard with offsetting joints, with a 4 mm gap between the sheets, or

(c) subfloor sheathing reinforced with close spaced 38 mm by 38 mm blocking at spacings at least half that of the floor joist spacing.

3. Applicant's Position

The Agent for the Applicant claimed that it is common practice in the residential construction industry to apply ceramic tile directly to subfloor sheathing, typically 15.9 mm or even 19 mm plywood or OSB is installed as the subfloor sheathing. He also explained that in these circumstances, the floor joist spacing is reduced to 300 mm (12 in.) when 15 mm OSB or plywood is used, and 400 mm (16 in.) floor joist spacing when 18.5 mm or 19 mm OSB or plywood is used.

However, the Agent reported that the ceramic tile at 32 Emily Anna Street has been installed as follows:

- Ceramic tile was applied directly to the subfloor with a scratch coat of adhesive (thin-set method)
- Subfloor was 15 mm OSB sub-floor conforming to CSA 0325 or 15.5 mm or 15.5 mm softwood plywood conforming to CSA 0151
- The joist spacing below all ceramic tile areas was 12 in. on center

The Agent explained that the thin-set tile installation method that has been used for the subject property does not include an underlay. Instead ceramic tiles are applied directly to the subfloor. In addition, the joists are spaced closer than what is required in the Code

The Agent maintained that the various descriptions of floor assemblies that are acceptable for the installation of ceramic tile flooring outlined in the 1997 Building Code relate to providing and adequately stiff support for the tile without allowing excessive deflection. Therefore, the Agent argued, that if a structural analysis can demonstrate that the floor assembly used to support ceramic tile at the subject property will deflect no more than any of the assemblies prescribed by the Code, then equivalency to the requirements of the Code will have been achieved.

Referring to a February 13, 2007 structural analysis report, prepared by Quaile Engineering Ltd., the Agent asserted that Quaile's analysis concluded that that the strength and stiffness of the floor system installed at 32 Emily Anna Street, Vaughan, is equivalent to, or better than, the waferboard/underlay assembly described in the Code for ceramic tile installation. Therefore, on this basis, the Agent argued, that the subject as-constructed floor assembly demonstrates sufficiency of compliance with Article 9.30.6.3 of the 1997 Building Code.

4. Respondent's Position

The Respondent submitted that the subject ceramic tile installation, does not meet the prescriptive requirements of Sentence 9.30.6.3.(1) of the 1997 Building Code. The Respondent maintained that the Code provides for a choice of assemblies to reinforce a floor assembly that supports ceramic tiles set on panel-type wood sheathing. The Respondent submitted that the proposal by the Applicant does not meet the specific requirements of the 1997 Building Code as set out in Article 9.30.6.3.

5. Commission Ruling

It is the Decision of the Building Code Commission that the as-installed ceramic tile flooring, where the ceramic tile has been applied directly to the subfloor with a scratch coat adhesive mortar (thin-set method), on a subfloor of 15.5 mm softwood plywood conforming to CSA 0151 or 15 mm OSB subfloor conforming to CSA 0325 with a reduced joist spacing of 300 mm (12 in.) on centre below the tiled areas, sufficiently complies with Article 9.30.6.3. of the 1997 Ontario Building Code at 32 Emily Anna Street, Vaughan, Ontario.

6. Reasons

i) Clause 9.30.6.3.(1)(a) of the Building Code requires that the floor joists be spaced not more than 400 mm (16 in.) on centre. The structural design of the floor assembly supporting the ceramic tiles in this building was designed to have floor joists spaced to 400 mm (16 in). The Commission heard that the areas where ceramic tiles have been installed using a thin-set method, have a reduced floor joist spacing of 300 mm (12 in.) on centre.

ii) The Commission was presented with evidence and testimony that Quaile Engineering Ltd., an independent third party and professional engineering consulting firm, compared and analyzed the structural performance of the subject floor assembly with that of the three prescribed options in the Building Code. The Quaile Engineering documentation, submitted as part of application, concluded that the subject floor assembly provides strength and stiffness that is equivalent to, or better than the floor assemblies prescribed by the Code for ceramic tile application.

PANEL	Tony Chow, Chair Mina Tesseris Gerry Egberts
PLACE	Toronto, Ontario
DATE OF HEARING	July 10, 2008
DATE OF RULING	July 10, 2008
APPEARANCES	Robert Hann The Beddlington Home Corporation Oshawa, ON **The Applicant** John Foote Building Inspector City of Oshawa **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Order to Comply under the *Building Code Act*, *1992*, to remedy certain alleged code deficiencies at Shoppers Drug Mart, Lake Vista Square, Shopping Centre, 199 Wentworth St. West, Oshawa, Ontario.

The subject building is a one storey, non-combustible building with fire alarm and sprinkler system and has a building area of 1579 m².

The construction in dispute involves the as-constructed guards comprised of pipe railing located along a retaining wall of a truck loading ramp and the east exit stairs located at a vehicular ramp at the subject building. The pipe railing has been constructed with openings greater than 100 mm. An Order to Comply has been issued to the Applicant indicating that the guards do not comply with Sentences 3.3.1.17.(4) and (5) of Division B, of the Building Code, which state in part: Openings through any *guard* that serves a *building* of other than *industrial occupancy*, shall be of a size that, will prevent the passage of a sphere having a diameter more than 100 mm unless it can be shown that the location and size of openings that exceed these limits do not represent a hazard.

2. Provisions of the Building Code in Dispute

3.3.1.17. Guards

(4) Openings through any *guard* that is not required by Sentence (1) and that serves a *building* of other than *industrial occupancy*, shall be of a size that,

(a) will prevent the passage of a sphere having a diameter more than 100 mm, or

(b) will permit the passage of a sphere having a diameter more than 200 mm unless it can be shown that the location and size of openings that exceed these limits do not represent a hazard.

(5) Unless it can be shown that the location and size of openings do not present a hazard, a *guard* shall be designed so that no member, attachment or opening located between 140 mm and 900 mm above the level protected by the *guard* will facilitate climbing.

3. Applicant's Position

The Applicant submitted that the retaining wall was approximately 203 mm thick and had been constructed with a slope having a height of 381 mm at its lowest point and then increasing to a height of 762 mm. The Applicant maintained that the loading ramp retaining wall is not part of a walkway ramp and there is no attractant for any public member to be at the back of the building. On the contrary, he advised, garbage rooms were located in this area and the smell would also be a deterrent for anyone to want to "hang out". The Applicant maintained that this area was only used by truck drivers delivering goods and by employees receiving the shipments and therefore it was unlikely for members of the public to be in this area of the building.

The Applicant contended that numerous other buildings, including another Shoppers Drug Mart in the area, have the very same guards installed at their truck loading ramps and emergency stairways. The Applicant submitted that as the guards were located at the back of a commercial building in the "loading dock" area, the guards can be considered to meet the code requirements for an industrial building. The Applicant argued that installing a mesh or pickets having a

maximum opening of 100 mm along the retaining wall of the truck loading ramp would only prevent one from falling forward over the retaining wall but not from falling backwards from the side the person used to climb onto the wall, therefore, in this situation guards with an opening of less than 100 mm would not be effective. The Applicant added that he did not disagree with mesh or pickets being installed to serve the east exit stair location and would comply with this request.

In response to questions the Applicant clarified the location of the retaining wall in relation to the location of the building.

4. Respondent's Position

The Respondent submitted that the guard at the top of the retaining wall and the guards installed at the emergency exit door do not comply with the Code. The Respondent advised that the openings in the installed guards would allow the passage of a sphere having a diameter of more than 100 mm, as the openings in the guard were in fact 609 mm.

The Respondent stated that although the guards in question were located at the back of the building, there was a possibility for children to be in the area and that they could get hurt. Further, the Respondent argued that one of the exit stairs was one of the required emergency exit. It was the Respondent's opinion that the as-installed guards facilitated climbing and presented a hazard therefore, they d0 not comply with the Code.

5. Commission Ruling

It is the decision of the Building Code Commission that the as-installed guard, serving a truck loading ramp retaining wall, consisting of pipe railing with openings greater than 100 mm, provides sufficiency of compliance with Sentences 3.3.1.17.(4) and 3.3.1.17.(5) of Division B of the Building Code at Shoppers Drug Mart, Lake Vista Square Shopping Centre, 199 Wentworth St. West, Oshawa, Ontario**.**

It is also the decision of the Building Code Commission that the as-installed guard serving the east exit stairs located at the vehicular ramp, consisting of pipe railing with openings greater than 100 mm, does not provide sufficiency of compliance with Sentences 3.3.1.17.(4) and 3.3.1.17.(5) of Division B of the Building Code at Shoppers Drug Mart, Lake Vista Square Shopping Centre, 199 Wentworth St. West, Oshawa, Ontario**.**

6. Reasons

i) Sentences 3.3.1.17(4) and 3.3.1.17(5) of the Building Code limit the size and location of openings in a required guard. In the opinion of the Commission, the retaining wall is not part of the subject building and further, is not a designated structure as defined under the Building Code; therefore the as-installed guard is not a required guard.

ii) The as-installed guard serving the east exit stairs, located at the vehicular ramp for the building, is a required guard. This guard is therefore required to comply with Sentences 3.3.1.17(4) and 3.3.1.17.(5) of the Code. The as-installed guard includes openings greater than 100 mm and consists of horizontal members that could facilitate climbing. The Commission was not convinced that the size and location of the openings did not present a hazard.

Dated at Toronto this **10th** day in the month of **July** in the year **2008** for application number **2008-18.**

Ruling No. 08-20-1194
Application No. 2008-13

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF with Sentence 1.2.1.1.(1) of Division B, and Sentence 3.1.9.1.(1) of Regulation 350/06, as amended, (the Building Code).

AND IN THE MATTER OF an application by Jeffrey T. Birchmeier, Kellogg Company for the resolution of a dispute with Ted Marecak, Chief Building Official, City of Belleville, to determine whether the alternative solution proposed, as per Article 1.2.1.1. of Division A, for six firestop systems which are identified in the Morrison Hershfield report as Numbers 2, 4, 6, 7, 8, and 9, which have not been tested to ULC-S115-95 “Fire Tests of Firestop Systems” provides sufficiency of compliance with Sentence 3.1.9.1.(1) of Division B of the 2006 Building Code, at 501 College Street East, Belleville, Ontario.

APPLICANT	Jeffrey T. Birchmeier Kellogg Company Battle Creek, Michigan
RESPONDENT	Ted Marecak Chief Building Official City of Belleville
PANEL	Tony Chow, Chair Mina Tesseris Gerry Egberts
PLACE	Toronto, Ontario
DATE OF HEARING	July 10, 2008
DATE OF RULING	July 10, 2008
APPEARANCES	Dana Scherf Morrison Hershfield Ottawa, ON **Agent for the Applicant**
	Ted Marecak Chief Building Official City of Belleville **The Respondent**

RULING

1. Particulars of Dispute

The subject building is a Group F, Division 2 manufacturing plant with a building area of approximately 19, 000 m² and is 1 storey in building height. The building is of non-combustible construction and is sprinklered.

The Building Code stipulates that where more than one exit is required, the exits be either located within the specified travel distance or alternatively, except for high hazard industrial occupancies, be placed along the perimeter of the floor area not more than 60 m apart. In this case, the Architect has chosen the latter option. Exterior exit doors are provided on all sides of the building along the perimeter, except that on the west side an exit corridor has been created between the manufacturing plant and the mechanical areas that lead to an exterior exit door. The exit corridor is provided with a 2 h rated fire separation.

The dispute between the two parties involves the firestopping of service penetrations and construction joints in the above mentioned exit corridor and the mechanical room space over the corridor. Sentence 3.1.9.1.(1) of Division B of the Building Code states that where building service items penetrate a fire separation or a membrane of a rated assembly, a firestop system tested in accordance with ULC-S115, “Fire Tests for Firestop Systems” ,must be provided. The subject firestop systems have not been tested in accordance with ULC-S115. Instead, the Applicant has proposed an alternative solution in the form of Engineering Judgments (EJ’s) that are produced by the manufacturer of the subject firestop systems. An “Engineering Judgment” is a design prepared by the manufacturer for a specific application on a given project that has not been tested and consequently not listed. The EJ’s in question were prepared based on other tested designs that are considered comparable to the actual field applications in the subject building.

Initially, the Applicant sought a ruling for 9 proposed firestop systems. During the course of the hearing the parties agreed that 3 out of the 9 proposed firestop, namely Numbers 1, 3, and 5 identified in the Morrison Hershfield report, did not need to be dealt with by the Commission, as firestop system Number 1 was no longer in dispute and firestop systems Number 3 and 5 did not fall within the parameters of Article 3.1.9.1. of the Building Code. As a result of this, the Commission will only rule on the sufficiency of compliance of the six firestop systems.

Therefore, the dispute before the Commission is whether the alternative solution proposed, as per Article 1.2.1.1. of Division A, for six firestop systems which are identified in the Morrison Hershfield report as Numbers 2, 4, 6, 7, 8, and 9, and which have not been tested to ULC-S115-95 “Fire Tests of Firestop Systems” provides sufficiency of compliance with Sentence 3.1.9.1.(1) of Division B of the 2006 Building Code, at 501 College Street East, Belleville, Ontario.

2. Provisions of the Building Code in Dispute

Division A, Article 1.2.1.1 Compliance with Division B

(1) *Compliance with Division B shall be achieved,*
(a) by complying with the applicable acceptable solutions in Division B, or
(b) by using alternative solutions that will achieve the level of performance required by the applicable acceptable solutions in respect of the objectives and functional statements attributed to the applicable acceptable solutions in Supplementary Standard SA-1.

(2) *For the purposes of Clause (1)(b), the level of performance in respect of a functional statement refers to the performance of the functional statement as it relates to the objective with which it is associated in Supplementary Standard SA-1.*

Division B, Article 3.1.9.1. Fire Stopping of Service Penetrations

(1) *Except as required by Sentence (2), piping, tubing, ducts, chimneys, optical fibre cables, electrical wires and cables, totally enclosed noncombustible raceways, electrical outlet boxes and other similar building services that penetrate a fire separation or a membrane forming part of an assembly required to have a fire-resistance rating, shall be,*
(a) sealed by a fire stop system that, when subjected to the fire test method in ULC-S115, "Fire Tests for Fire Stop Systems", has an F rating not less than the fire-protection rating required for closures in the fire separation in conformance with Table 3.1.8.4., or
(b) tightly fitted.

3. Applicant's Position

The Agent for the Applicant advised that Morrison Hershfield, an independent, engineering consulting firm, was retained to develop an alternative solution for the firestop systems that will achieve an equivalent level of performance as required by the applicable acceptable solution. The Agent submitted a report (Exhibit 1), which included an analysis of the proposed firestop systems, to the Commission for review. The Agent advised that the proposed alternative solution is in the form of Engineering Judgments prepared by the manufacturer of the firestop system.

The Agent stated that the report outlined the alternative solution for each type of service penetration and explained that the performance level of various features of the Engineering Judgments (EJ's) firestop systems were compared to the performance level of the firestop systems tested in accordance with ULC S-115, "Fire Tests of Firestop Systems", as required by the Code.

The Agent explained that the EJ's were analyzed and found satisfactory based on a variety of factors including: the application of the objective and functional statements of the Code attributed to the acceptable solution, a comparison between the EJ's and referenced tested firestop systems, and a comparison of the Code referenced ULC Standard with the applicable ASTM Standard.

The Agent declared that Morrison Hershfield's analysis of the key features of fire tests and the method of evaluation for firestop systems demonstrated that the alternate test standard, ASTM-814 Standard (2006 Edition), achieves the equivalent performance level established by ULC-S115, which is referenced in the Code.

The Agent stated that the proposed alternative designs for the subject firestop systems were derived from tested and listed designs which are considered comparable to the firestop systems being proposed. Further, the Agent explained that where there were minor deviations, compensating measures were provided for the variances.

The Agent pointed out that the prescriptive requirements of the Building Code, in this instance, would require that the firestop systems achieve and F rating of 1.5 hours and that, in fact, the six firestop systems in question achieve an F rating of 2 hours.

The Agent noted that the Building Code permits alternative solutions that will achieve the same performance level as the applicable acceptable solution in Division B. In addition, she reported that Morrison Hershfield's analysis and evaluation found that the proposed firestop systems achieve the level of performance required by the applicable Division B solution. In conclusion, she indicated that since the firestop systems are considered to slow the spread of fire and collapse and minimize damage to the building and injuries to persons, therefore compliance with the intent of the Building Code has been achieved..

4. Respondent's Position

The Respondent advised that the proposed alternative solution related to the firestopping of service penetrations and for construction joints and further advised the Commission that the as-constructed conditions varied from the listed firestop systems available on the market.

The Respondent explained that listed firestop systems in compliance with the Code are available for most of the applications involved. Therefore, using "Engineering Judgments" to propose alternative systems is not justified. Further, the Respondent advised that the "Best Practice Guide on Fire Stops and Fire Blocks and their impact on Sound Transmission" published by the National Research Council Canada notes in part that *It is important for users to realize that Engineering Judgments are not intended as substitutes for listed fire stop systems, where they exist; but are intended for use where a specific field application, for which there is no listed fire stop system, is encountered, or where all of the requirements for a listed system cannot be practically met in a field application*. Therefore, on this basis, the Respondent explained that the alternative solutions for those applications where listed firestop designs are available were deemed to be unacceptable.

In addition, the Respondent declared that exit facilities in buildings are provided with special considerations due to their important role in life safety. In this instance, the Respondent maintained that the level of protection to the building occupants and to fire and rescue crews within the exit corridor would be reduced by the acceptance of untested firestops and would thereby, contravene Division A sentence 1.2.1.1.(1)(b).

In summary, the Respondent reiterated that there are listed firestop systems available for most of the applications involved and using untested firestop systems will reduce the performance level of the building. He stated that, after reviewing the contents of the report submitted by the Applicant, it is his opinion that the proposed alternative solution does not achieve the same level of performance required by the prescriptive requirements of the Building Code and consequently was found to be unacceptable.

5. Commission Ruling

It is the decision of the Building Code Commission that the alternative solution proposed, as per Article 1.2.1.1. of Division A, for six firestop systems which are identified in the Morrison Hershfield report as Numbers 2, 4, 6, 7, 8, and 9, which have not been tested to ULC-S115-95 “Fire Tests of Firestop Systems” provides sufficiency of compliance with Sentence 3.1.9.1.(1) of Division B of the 2006 Building Code, at 501 College Street East, Belleville, Ontario.

6. Reasons

i) Sentence 2.1.1.2.(2) of Division C of the Building Code states, “The results of tests or evaluations based on test standards other than as described in this Code may be used …if the alternate test standards provide comparable results”. Evidence and testimony presented by Morrison Hershfield, an independent third party and professional engineering consulting firm, provided an analysis of the key features of the fire tests and method of evaluation of firestop systems and concluded that the alternate test standard, ASTM-814 Standard (2006 Edition), achieves the equivalent performance level established by ULC-S115, referenced in the 2006 Building Code.

ii) Further, the Commission heard that the proposed alternative designs for the subject firestop systems are derived from tested designs which are considered comparable to the subject firestop systems. Where there are minor deviations, compensating measures have been provided for the variances.

iii) Sentence 3.1.9.1.(1) of Division B of the Code requires firestop systems to achieve an appropriate F rating when subject to the fire test method in ULC-S115. The prescriptive requirements of the Building Code, in this instance, would require that the firestop systems achieve and F rating of 1.5 hours. The Commission was informed that the six firestop systems in question, achieve and F rating of 2 hours, which exceeds the minimum 1.5 hour F rating that would be required.

iv) Article 1.2.1.1. of Division A of the Building Code requires that compliance with Division B be achieved either through compliance with the applicable acceptable solutions in Division B or through an alternative solution that will achieve the same level of performance as required by the applicable acceptable solution in respect of the objectives and functional statements attributed to the applicable acceptable solution in Supplementary Standard SA-1. Morrison Hershfield’s analysis and evaluation concludes that the proposed firestop systems meets the performance level of the applicable Division B solution since the firestop systems are considered to slow fire spread and collapse in order to minimize building damage and injuries to persons to the equivalent performance level of Division B.

Ruling No. 08-17-1191
Application No. 2008-08

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 8.2.1.3.(4) and Table 8.2.1.3.B. of Regulation 350/06, as amended, (the Building Code).

AND IN THE MATTER OF an application by David Morrissay, Hamilton Wentworth Catholic District School Board for the resolution of a dispute with John Spolnik, Chief Building Official, City of Hamilton, to determine whether the existing Class 4 sewage system, which is proposed to serve an existing elementary school and the addition of a new, unattached, 4-classroom portable building, provides sufficiency of compliance with Sentence 8.2.1.3.(4) and Table 8.2.1.3.B. of the Ontario Building Code at Our Lady of Assumption Elementary School, 55 Highway # 20 East, Stoney Creek, ON.

APPLICANT	David Morrissay, Hamilton Wentworth Catholic District School Board, Hamilton, ON
RESPONDENT	John Spolnik Chief Building Official City of Hamilton
PANEL	Judy Beauchamp, Vice-Chair Jim Wilkinson Eric Gunnell
PLACE	Toronto, Ontario
DATE OF HEARING	May 8, 2008
DATE OF RULING	May 8, 2008
APPEARANCES	David Hine Hine Reichard Tomlin Inc. Markham, ON **Agent for the Applicant** Lisa Simmons Building Engineer City of Hamilton **Designate for the Respondent**

RULING

1. Particulars of Dispute

The subject building is an existing Group A, Division 2, elementary school. The Applicant has applied for a permit to locate a new, unattached, 4-classroom portable building on the existing school's property. The issue at dispute relates to the existing sewage system currently servicing the elementary school.

The existing Class 4 sewage system was constructed in 1962. It is an absorption trench type system with 1525 m of distribution pipe and a 28 640 L septic tank.

The dispute before the Commission relates to the calculation of the total daily design sanitary sewage flow generated by the school. The total daily design sanitary sewage flow determines the legislation under which the treatment system is governed. The Building Code regulates *sewage systems* that have a design capacity equal to or less than 10 000 litres per day. Systems with greater capacities are considered *sewage works* and regulated under the *Ontario Water Resources Act* (OWRA) under the purview of the Ministry of Environment (MOE).

In this case, the Applicant is proposing to calculate the daily design sanitary sewage flow using a rate of 14 L/day per person, based on delivered water usage and comparison results of 39 other school's water usage, instead of 30 L/day, which is the required daily design sanitary sewage flow rate for "schools" specified by Table 8.2.1.3.B. of the Building Code. The Respondent's position is that the sanitary sewage flow calculation based on 30 L/day, as required by the Code, would place the design capacity of the sewage system at greater than 10 000 L/day, which would therefore, place the system under the jurisdiction of the Ministry of Environment (MOE).

2. Provisions of the Building Code in Dispute

8.2.1.3. Sewage System Design Flows

(4) Where an *occupancy* is not listed in Table 8.2.1.3.B., the highest of metered flow data from at least 3 similar establishments shall be acceptable for determining total daily design *sanitary sewage* flow.

Table 8.2.1.3.B.
Other Occupancies

Forming Part of Sentence 8.2.1.3.(2)

Column 1	Column 2
Establishments(1)	Volume, litres
Schools - per student	
a) Day school,	30
b) With showers,	30
c) With cafeteria, and	30
d) Per non-teaching employee per 8 hour shift	50

Notes to Table 8.2.1.3.B.:

(1)The *occupant load* shall be calculated using Subsection 3.1.17.

(2)Flea markets open more than 3 days per week shall be assessed using the volumes stated under the heading “Stores”.

(3)Where multiple calculations of *sanitary sewage* volume is permitted the calculation resulting in the highest flow shall be used in determining the design daily *sanitary sewage* flow.

(4)The number of fuel outlets is considered the maximum number of gas nozzles that could be in use at the same time.

3. Applicant’s Position

The Agent submitted that Our Lady of the Assumption school, as of September 2007, had a student population of 398 and a staff of 30 people resulting in a total occupant load of 428 persons. The Agent conceded that based on the Building Code daily design sanitary sewage flow rate of 30 L per student/day and 50 L per non-teaching staff/day that the resulting total water usage would be over 10 000L/day. However, the Agent argued that the Code’s information on water usage per person was based on information gathered in the 1970’s and since then, technology advancements concerning water consumption have changed. The Agent contended that water is no longer considered an inexpensive resource and as a result, efficient water use appliances have been created such as low flow toilets and automatic faucets. When considering that the majority of water usage at this school is from toilet/urinal/lavatory use, the Agent maintained that the water saving initiatives along with actual water usage data should be taken into consideration when calculating the daily design sanitary sewage flow.

The Agent noted that Sentence 8.2.1.3.(4) of the Code states, “where an occupancy is not listed in Table 8.2.1.3.B, the highest of metered flow data from at least 3 similar establishment shall be accepted for determining the total daily design sewage flow.” The Agent submitted that although the “schools” are listed in Table 8.2.1.3.B., the table is not an accurate reflection of the actual water usage of schools. The Agent presented a report where 39 schools within the Hamilton-Wentworth Catholic District School Board were evaluated from the 2006 to 2008 school year, where the average water consumption per person was determined to be 13 L/day. The Agent further argued that as Our Lady of the Assumption was not connected to the municipal water system, water had to be delivered to the building. As such, records of water delivery to date were kept; the Agent pointed out that the records indicate that the actual water usage of the school is approximately 30 000 L/week, which then averages out to approximately 14 L day/person. As a result, the Agent maintained that based on both the study of 39 schools within the same Board and the actual water usage confirmed by water delivery reports, the total capacity of the sewage system serving the subject school was not greater than 10, 000 L/day.

Further, the Agent maintained that there had been no observable operating problems since with the existing sewage system with the 428 persons occupying the school since September 2007.

4. Respondent’s Position

The Designate for the Respondent submitted that the Applicant has proposed to use a daily design sanitary sewage flow rate of 14L/day per person instead of the minimum required daily design sewage flow of 30L/day per person as specified by Table 8.2.1.3.B. of the Building Code.

The Designate maintained that by using the rate specified in Table 8.2.1.3.B., the design capacity of the existing on-site sewage system was approximated at greater than 10, 000L/day, placing the system under the jurisdiction of MOE.

The Designate argued that although the Agent's report indicates actual water usage to be estimated at 14 L per person/day, the Building Code requires the daily design sanitary sewage flow for to be at least the value in the Table 8.2.1.3.B. She agreed that Sentence 8.2.1.3.(4) permits using metered flow data from similar establishments where an occupancy is not listed in Table 8.2.1.3.B. However, in this case "schools" are listed in Table 8.2.1.3.B.

Further, the Designate submitted that a secondary issue was the occupant load. The Designate noted that the current occupant load of the school was 428 persons, but that in the previous school year it was 394 persons, thus, under Sentence 11.4.2.5.(2) of the Building Code, a review of an existing on-site sewage system is required. The Designate also pointed out that even if there was no increase in occupant load, Sentence 11.4.2.5.(1). of the Building Code would still require a review of the existing sewage system.

In summation, the Designate reiterated that, in her opinion, the Ministry of Environment had jurisdiction over this matter and that the issue was clearly defined by the Code; the daily design flow should be calculated as per the Code provisions. As such, the daily design flow would be greater than 10, 000 L/day and therefore, the Municipality does not have jurisdiction to approve the design capacity for the system.

5. Commission Ruling

It is the decision of the Building Code Commission (the "Commission") that the Commission does not have the jurisdiction to make a determination on the issues raised in relation to the matter at Our Lady of Assumption Elementary School, 55 Highway # 20 East, Stoney Creek, Ontario.

6. Reasons

1. Subsection 24(1) of the *Building Code Act, 1992* provides the Commission with the jurisdiction to resolve disputes between a permit applicant, permit holder, or a person to whom an order has been issued and the chief building official, a registered code agency or inspector, concerning the sufficiency of compliance with the technical requirements of the Building Code.

   The *Ontario Water Resources Act, R.S.O 1990,* Section 53(6) determines whether the *Building Code Act, 1992* is applicable to a particular case by stating "This section does not apply, to a sewage system that is subject to the *Building Code Act, 1992"*

   While the Commission recognizes that there is a disagreement between the parties regarding the total daily design flow of the sewage system, the Commission does not have the jurisdiction to determine this disagreement.

2. A sewage system, as defined by the Building Code, requires that the sewage system has a design capacity of 10 000 litres per day, or less. Design capacity, as defined in Article 1.4.1.2. of Division A of the Building Code, means the total daily design sanitary sewage flow determined in accordance with Article 8.2.1.3. of Division B of the Building Code.

3. Sentence 8.2.1.3.(2) states that the total daily design flow for all occupancies, other than residential occupancies, shall be determined in accordance with Table 8.2.1.3.B. The calculated daily design sewage flow from Table 8.2.1.3.B combined with the reported enrolment of the subject school results in a flow in excess of 10 000 litres per day.

4. Sentence 8.2.1.3.(4) states, where an occupancy is not listed in Table 8.2.1.3.B., the

highest metered flow data from at least three similar establishments shall be acceptable for determining the total daily design sanitary sewage flow. Table 8.2.1.3.B. includes a reference on how to determine the total daily design sanitary sewage flow for a school. Therefore, it is the Commission's opinion that in this case, Table 8.2.1.3.B does apply.

Application No. 2008-06

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 11.4.2.5 (3) of the Regulation 403 as amended, (the Building Code).

AND IN THE MATTER OF an application by Ugo Mio, Homeowner for the resolution of a dispute with Ed Vanderwindt, Chief Building Official, Haldimand County, to determine whether the proposal to construct an addition to a one storey, two bedroom, seasonal cottage, which will increase the size of the existing cottage by 29.5%, and that will be served by the existing Class 5 sewage system with a 9000L capacity, provides sufficiency of compliance with Sentence 11.4.2.5 (3) of Division B of the 2006 Building Code at 501 Haldimand Road 17, Dunnville, ON.

APPLICANT	Ugo Mio Homeowner Hamilton, ON
RESPONDENT	Ed Vanderwindt Chief Building Official Haldimand County
PANEL	Judy Beauchamp, Vice-Chair Jim Wilkinson Eric Gunnell
PLACE	Toronto, Ontario
DATE OF HEARING	May 8, 2008
DATE OF RULING	May 8, 2008
APPEARANCES	Ugo Mio Homeowner Hamilton, ON **The Applicant** Ed Vanderwindt Chief Building Official Haldimand County **The Respondent** Gord Reichelt, Building Inspector Haldimand County **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has proposed to construct an addition to a one storey, two bedroom, seasonal cottage, which will increase the size of the existing cottage by 29.5%, and that will be served by the existing Class 5 sewage system with a 9000L capacity, provides sufficiency of compliance with Sentence 11.4.2.5 (3) of Division B of the 2006 Building Code at 501 Haldimand Road 17, Dunnville, ON.

2. Provisions of the Building Code in Dispute

11.4.2.5. Sewage Systems

(3) The *performance level* of an existing *dwelling unit* is reduced where *proposed construction* that,

(a) increases the number of bedrooms in the *dwelling unit*,

(b) exceeds 15% of the finished area of the *dwelling unit*, or

(c) adds new *plumbing fixtures to the dwelling unit*,

will result in the total daily design *sanitary sewage* flow of the *dwelling unit*, calculated in accordance with Article 8.2.1.3., exceeding the capacity of any component of a *sewage system* serving the *dwelling unit*.

3. Applicant's Position

The Applicant submitted that the proposed construction to the cottage involves increasing the living space. The Applicant advised the Commission that the proposed addition would increase the total finished area of the dwelling from 53 m² to 68.7 m², resulting in an increase of approximately 29%. However, the Applicant argued that the proposed construction did not include the addition of bedrooms or plumbing fixtures and therefore would not result in any additional strain to the existing sewage system. The Applicant maintained that the addition proposed was mainly to accommodate a large closet and widen the two existing bedrooms, thereby creating a more comfortable environment. He reiterated that the occupant load, number of bedrooms and fixtures would remain the same and therefore, it was his opinion that there is no adverse effect on the existing holding tank.

4. Respondent's Position

The Respondent submitted that prior to the commencement of the new 2006 Building Code an addition resulting in a finished area greater than 15% would be allowed by upgrading the holding tank to compensate for the reduction in sewage system performance. However, this option was removed in the 2006 Building Code. The Respondent further submitted that under Division B of the 2006 Building Code, the Applicant's proposed addition would increase the finished area of the dwelling unit by 29.5%, thereby exceeding the 15% prescribed by Sentence 11.4.2.5.(3) of the Building Code and further, reducing the performance level of the sewage system.

5. Commission Ruling

It is the decision of the Building Code Commission that the proposal to construct an addition to a one storey, two bedroom, seasonal cottage, which will increase the size of the existing cottage by 29.5%, and that will be served by the existing Class 5 sewage system with a 9000L capacity, provides sufficiency of compliance with Sentence 11.4.2.5 (3) of Division B, of the 2006 Building Code at 501 Haldimand Road 17, Dunnville, Ontario.

6. Reasons

i) Sentence 11.4.1.1.(1) of Division B, of the 2006 Ontario Building Code requires that the performance level of the building (in this case, the subject sewage system) after construction, not to be less than the performance level of the building prior to construction. Further, the Building Code sets the conditions under which the performance level of a dwelling unit is reduced and mandates the upgrade of the sewage system when necessary.

ii) Sentence 11.4.2.5.(3), Division B, of the Building Code lists three conditions, which must trigger a review of the performance level of the sewage system. The three conditions are as follows:

- 11.4.2.5.(3)(a) increase in the number of bedrooms in the dwelling unit,
- 11.4.2.5.(3)(b) exceed 15% of the finished area of the dwelling unit, or
- 11.4.2.5.(3)(c) adds new plumbing fixtures to the dwelling unit…

In this case, the proposed construction results in an extension of more than 15% of the finished area of the dwelling unit. As such, a review of the performance level of the sewage system is required. However, the need to upgrade the sewage system is conditional upon whether the capacity of the sewage system will be exceeded. Therefore, the total daily design sanitary sewage flow must be calculated in accordance with Article 8.2.1.3. of Division B, of the Building Code.

iii) Using Table 8.2.1.3.(A) of Division B, of the Building Code, the total daily design sanitary sewage flow for the subject dwelling, having two bedrooms, 7.5 fixture units, and a proposed finished building area of 70 m², is 1100 L/day. Further, the holding tank required to service this dwelling should have a holding capacity of not less than 7 days, which is 7700 L. As the Building Code does not allow a Class 5 sewage system with a capacity of less than 9000 L, and as the current Class 5 sewage system is 9000 L, it is the Commission's opinion that the existing Class 5 Sewage System sufficiently complies with Sentence 11.4.2.5 (3) of the Building Code.

RULING

1. Particulars of Dispute

The Applicant has received a permit under the *Building Code Act*, *1992*, to construct a residential condominium building at the Accolade Tower, 1250 Eglinton Avenue East, Toronto, Ontario.

The subject building is a Group C, 34 storey condominium with a height that exceeds 84 m. The proposed building is of non-combustible construction and is equipped with a fire alarm and a standpipe system. A sprinkler system is also installed but only in required areas.

The construction in dispute involves the design of the water supply piping between the City water main and the subject building. The Applicant is proposing to have two water supply lines connect to either side of a valve in the city water main. However, once connected to the city main, the two water supply lines will join into a single 200 mm diameter private fire service main, at or on the property line which will continue approximately 500 m to the building, where it will then supply water for both the sprinkler and the standpipe and hose systems. Therefore, the dispute before the Commission is whether the proposed design provides sufficiency of compliance with Sentence 3.2.9.7.(4). of the 1997 Ontario Building Code.

2. Provisions of the Building Code in Dispute

3.2.9.7. Water Supply for 65 mm Hose Connections

(4) If the *building* is 84 m (275 ft 7 in) or more high, measured between *grade* and the ceiling level of the top *storey*, the building shall be served by not less than two sources of water supply from a public water system.

3. Applicant's Position

The Agent for the Applicant submitted that the design of the water supply to the subject condominium development consists of the installation of a new 300 mm diameter valve and chamber onto the city's water main, having two 200 mm diameter water main connections installed on either side of the new valve. The two 200 mm supply lines leading into the site, also having been provided with valves, would then join into a single 200 mm diameter water main that would serve the subject building.

The Agent stated that the Respondent is of the position on the matter is that the two water supply connections from the city's water main should continue from the public water source connection all the way to the subject building. The Agent stated that in his opinion, a careful reading of Sentence 3.2.9.7.(4) of the Building Code, suggests that the Respondent's position is not founded.

The Agent argued that the most important words in the Code requirement are, "…two sources…from…" The Agent argued that Sentence 3.2.9.7.(4) is referring to the "sources" of water supply "from" a public water system, and not the configuration of distribution piping which extends away from the source of water supply. Further, suggesting that the "sources" relates to the actual point of connection, and not to the piping extending to a building from such points of connection. The Agent maintained that the proposed configuration of the water supply piping where there are two pipes, one connected on either side of a valve in the city's water main, provides two sources of water supply from a public system, therefore complying with Sentence

3.2.9.7.(4) of the Code.

The Agent suggested that the intent of this provision of the Code is to limit the probability that the building will be without water when there is a need for firefighting. The proposed provision of a valve in the public water main between the two branches which feed the subject building provides a degree of back-up or safeguard of water supply in the event of interruption of water due to maintenance or other events affecting the city water main. The Agent maintained that if such a disruption should occur on one side of the valve, that valve can be shut off, and the valve in the 200 mm feed to the building may also be shut off, leaving the other side of the main available to supply water to the building.

The Agent reported that due to the location of the site, the building faces only one street and therefore, can only connect to one city water main. The Agent also argued that if a second water supply pipe was required from the city's water main all the way to the building, due to the constraints of available space on the subject building site, it would have to be located adjacent to the first water main. As such, the construction of two water mains side-by-side would not be advisable, as a break in one water main could cause an adjacent water main to fail by washing out its foundation.

The Agent pointed out that in most buildings the two sources of water supply required by the Code converge into one main at some point. The Agent maintained that the Code does not prescribe where the convergence of the water supply piping should occur beyond the connections to the public water supply, and therefore, it was his opinion that the proposed design of the water supply piping sufficiently complies with Sentence 3.2.9.7.(4) of the Code.

4. Respondent's Position

The Designate for the Respondent submitted that the subject building is a new 34 storey condominium tower that has no access from the north, south, or west side of the building to the city's water main; the building's only access is from the east side of the site, which services the area of construction.

The Designate argued that since the building is greater than 84 m high, the Code requires the building to be served by two independent water sources. The Designate reported that the Applicant's proposal and drawings submitted to the municipality show only one water supply line leading to the building, and therefore do not comply with Sentence 3.2.9.7.(4) of the Code.

The Designate reported the municipality's position is that the Code is explicit: two private water mains should extend from the city's water main all the way to the building wall. He stated that they do not believe that two private water mains leading from the public water supply, which then converge into one private water main approximately 200 m away from the building, provides the building with the two separate required sources of water supply prescribed by the Code.

The Designate further stated that the municipality sought the opinion of the Building and Development Branch of the Ministry of Municipal Affairs and Housing and the local Toronto Fire Services department on this matter, and that they were both of the same opinion that two separate sources of water supply from a public water system would need to lead all they way to the building, in order to comply with Sentence 3.2.9.7.(4) of the Code.

5. Commission Ruling

It is the decision of the Building Code Commission that the proposed design of water supply piping between the City's water main and a 34 storey, residential building, where two water supply lines would connect to either side of a valve in the city water main, does not provide sufficiency of compliance with Sentence 3.2.9.7.(4). of the 1997 Ontario Building Code at the Accolade Tower located at 1250 Eglinton Avenue East, Toronto, Ontario.

6. Reasons

i) Sentence 3.2.9.7.(4) of the 1997 Building Code requires that a building which is 84m or more high must be served by not less than two sources of water supply from a public water system. It is the Commission's opinion, that as the subject building is more than 84 m high, the building requires two separate water supply lines to the building. Therefore, the proposal to join two water supply lines leading to the building into a single 200 mm diameter water main before reaching the building, does not provide sufficiency of compliance with the Building Code.

ii) Appendix 3.2.5.7 of the 1997 Ontario Building Code states that "an adequate water supply for fire fighting should be an immediately available and accessible water supply with sufficient volume and /or flow …" Therefore, it is the Commission's opinion that providing two sources of water supply to the building would limit the probability that the building would be without water during fire fighting, should one of the sources be disrupted or fail.

RESPONDENT	Arlene Gregoire Chief Building Official City of Ottawa
PANEL	Tony Chow, Chair Marina Huissoon Susan Friedrich
PLACE	Toronto, Ontario
DATE OF HEARING	March 20, 2008
DATE OF RULING	March 20, 2008
APPEARANCES	David Syrett Leber/Rubes Inc., Toronto, ON **Agent for the Applicant** Norm Allen Program Manager City of Nepean **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an order to comply under the *Building Code Act*, *1992*, and is constructing two new additions to an existing Group B, Division 2 major occupancy building at Montfort Hospital, 713 Montreal Street, City of Ottawa, Ontario.

The existing hospital is 6 storeys in building height, which includes the original 6 storey building built in 1953, a 4 storey link built in 1988 and a 4 storey addition built in 1992. The existing hospital is an acute-care facility. The new hospital expansion currently under construction includes a 4 storey addition on the west side and a 6 storey addition on the east side of the existing building. The existing hospital and new additions are equipped with a sprinkler system.

The construction in dispute involves three rooftop enclosures located on the roof of the 4 storey west addition. The approximate floor areas of the rooftop enclosures are 430 m², 250 m², and 360 m². The rooftop enclosures contain air-handling units and fans to service parts of the building.

The dispute revolves around the required fire separation for the vertical service spaces. Sentence 3.6.3.1.(2) of the 1997 Building Code requires vertical service spaces that do not extend through the roof of a building to be enclosed at the top with construction having a fire resistance rating not less than that required for the vertical service space walls. The vertical service spaces, air duct shafts in this case, associated with the air handling units in the rooftop enclosures are separated from each storey of the building by a 1 hour fire separation; however, they are not fire separated from the rooftop enclosure. The Respondent's position is that vertical fire separations for the vertical service spaces are required to terminate at the underside of the roof of the rooftop enclosure. The Applicant's position is that the vertical fire separations for the vertical service spaces are required to terminate at the underside of the 4th storey roof, which supports the rooftop enclosure.

2. Provisions of the Building Code in Dispute

3.6.3.1. Fire Separations for Vertical Service Spaces

(2) A *vertical service space* that does not extend through the roof of a *building* shall be enclosed at the top with construction having a *fire-resistance rating* not less than that required for the *vertical service space* walls.

3. Applicant's Position

The Agent for the Applicant submitted that the subject rooftop enclosures contain only air handling units that include fan equipment but do not contain any fuel fired appliances, storage rooms or any normally occupied spaces. He further submitted that the vertical service spaces associated with the air handling units were separated from each storey of the building by a 1 hour fire separation but were not fire separated from the rooftop enclosures. The Agent stated that it was the Applicant's position that the vertical fire separations for the vertical service spaces are required to terminate at the underside of the 4th storey roof and not the underside of the roof of the rooftop enclosure as per their understanding of Sentence 3.6.3.1.(2) of the Building Code and therefore, were in compliance with the Code.

The Agent advised that both the architectural drawings and mechanical drawings submitted for the building permit application indicated that the vertical fire separations would terminate at the underside of the 4th storey of the building.

He further explained that the floor assemblies in the addition would be constructed as fire separations have a fire-resistance rating not less than 2 hours, as required by Sentence 3.2.2.38.(2) of the Building Code; therefore, the vertical service spaces would also be separated from all other portions of each adjacent storey by a fire separation having a fire resistance rating of not less than 1 hour in accordance with Sentence 3.6.3.1.(1) of the Code. The Agent maintained that the purpose of the vertical fire separations for the vertical service spaces was to maintain the continuity of the required fire separation between storeys of the building. He argued that since the Code does not require a fire separation between the three rooftop enclosures and the remainder of the building, there was no requirement to separate the vertical service spaces from the roof top enclosures.

The Agent submitted that it was the Applicant's view that the vertical service spaces extend to the underside of the roof of the building as required by Sentence 3.6.3.1.(2) of the Code. The Agent argued that the Code does not require a rooftop enclosure for elevator machinery, a stairway, or a service room used for no other purpose than for service to the building to be considered a storey in calculating building height, as such, a rooftop enclosure should not be considered a storey for the application of Sentences 3.6.3.1.(1) and (2). As a result, he reasoned, the three rooftop enclosures are considered to be above the roof of the building.

The Agent submitted that as per Sentences 3.2.2.14.(1) and (2), a rooftop enclosure for a service room is required to be constructed in accordance with the construction type required by Subsection 3.2.2. but it is not required to have a fire resistance rating if the enclosure is not more than one storey high. Accordingly, he argued, the three rooftop enclosures were of non-combustible construction as they were not more than one storey high. The Agent contended that as per Sentence 3.6.2.2.(2) of the Code, a fire separation was not required between the rooftop appliance and the building it serves.

Further, the Agent maintained that according to Sentence 3.6.2.2.(5) of the Code, a service room was not required to be separated from the building if it contained a limited quantity of service equipment and the service equipment did not constitute a fire hazard. On this basis, the Agent argued that the Code does not require a fire separation between the subject rooftop enclosures and the remainder of the 4 storey addition and therefore, sufficiently complied with the Code.

In addition, the Agent advised that a reinforced 800 mm concrete structural roof slab would be provided for the subject addition, which not only supported the rooftop enclosures but would also inherently have a fire-resistance rating of 1 to 2 hours.

In response to questions, the Agent advised that the elevator shaft and the elevator machine room located next to one of the rooftop enclosures was separated from the subject enclosure by a 2 hour fire separation.

4. Respondent's Position

The Designate for the Respondent submitted that Sentence 3.6.3.1.(2) of the Building Code is very clear in this matter as it states that a vertical service space that does not extend through the roof of a building shall be enclosed at the top with construction having a fire-resistance rating not less than that required for the vertical service space walls, in this case, a 1 hour fire separation.

The Designate argued that the top of the three vertical service space shafts do not terminate at the underside of the roof, which in this case it is considered to be the roof of the rooftop enclosures and further, the vertical service spaces are not enclosed at the top with construction having a fire-resistance rating not less than that required of the vertical service space walls. Therefore, it is the Designee's position that the proposal to terminate the fire separation for the vertical service space at the underside of the 4th storey roof does not comply with Sentence 3.6.3.1.(2) of the Building Code.

The Designate agreed that Sentence 3.2.1.1.(1) of the Building Code states that the rooftop enclosures were not to be considered as a storey in calculation building height but maintained that this Sentence only applied to Section 3.2. Building Fire Safety of the Building Code and not Section 3.6. as was the case at hand.

The Designate maintained that the municipality's opinion was that the vertical service spaces must extend to the roof of the building, which in this case is the roof of the rooftop enclosures; otherwise the vertical service spaces must be enclosed at the top with a vertical fire separation of 1 hour. Further, the Designate submitted that this approach was in keeping with other recently constructed buildings in the municipality.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposal to terminate the fire separation for the vertical service spaces at the underside of the fourth storey roof, in an addition to a Group B, Division 2 care and treatment occupancy, provides sufficiency of compliance with Sentence 3.6.3.1.(2) of the 1997 Building Code at Montfort Hospital, 713 Montreal Street City of Ottawa, Ontario.

6. Reasons

i) As per Sentence 3.2.1.1. (1) of the Building Code, a roof-top enclosure provided for elevator machinery, a stairway or a *service room* used for no purpose other than for service to the *building*, shall not be considered as a *storey* in calculating the *building height*. Therefore, the proposed addition is considered to be 4 storeys in height in that part of the building. The rooftop enclosures are not considered in the calculation of building height.

ii) The roof assembly in this building is not required to have a fire resistance rating as per Article 3.2.2.38 of the Building Code, under which this building is classified.

iii) Further, the three roof top enclosures, containing only air handling equipment, are not required to be fire separated from the rest of the building as per Sentence 3.2.2.14. (2) of the Building Code which states, **"**A roof-top enclosure for elevator machinery or for a *service room*, not more than one *storey* high, is not required to have a *fire-resistance rating".* Therefore, it is the Commission's opinion that the vertical service spaces, used only for the building's air handling equipment, which will be separated from each storey of the building by a 1 hour fire separation, are not required to be fire separated from the rooftop enclosures.

iv) Sentence 3.6.3.1.(2) of the Code states, "A *vertical service space* that does not extend through the roof of a *building* shall be enclosed at the top with construction having a *fire-resistance rating* not less than that required for the *vertical service space* walls." Since the vertical service spaces could terminate at the roof

assembly if the rooftop enclosures did not exist, it is the Commission's opinion that the same level of performance will be achieved for the above stated reasons.

v) The elevator shaft and the elevator machine room located next to one of the roof top enclosures is separated from the subject enclosure by a 2 hour fire separation.

RULING

1. Particulars of Dispute

The subject building is an existing two storey, Group C, residential dwelling of combustible construction. The dispute involves the construction of a drainage, waste and vent system, installed to provide service to a new washroom in the second storey addition of a residential dwelling at 79 Facendi Drive, City of Peterborough, Ontario.

The Applicant received an Order to Comply under the *Building Code Act*, *1992*, to remedy certain alleged code contraventions. The Applicant also received an Order Not to Cover or Enclose the drainage, waste and venting system installed within the second storey addition of the subject building, and its connections to the existing drainage, waste and venting system in the home.

The dispute initially brought before the Commission pertained to whether the as-installed drainage piping for the new additional washroom, which discharges into the existing plumbing system, provides sufficiency of compliance with Clause 7.5.7.1.(1)(a), Subclause 7.5.5.3.(1)(a)(ii), Table 7.4.10.3.A, Sentence 7.4.8.2.(1), Sentences 7.3.3.11.(1), 7.3.6.1.(1), 7.3.7.1.(1), 7.4.7.1.(2), and Clause 7.5.7.1.(1)(d)(iii) of the 1997 Ontario Building Code.

At the outset of the hearing, the Applicant requested that the matter be reviewed under the 2006 Building Code for sufficiency of compliance. As the Respondent had no objections to this request, the Commission reviewed the matter under the 2006 Building Code.

It was also at the hearing that Clause 7.5.7.1.(1)(a), Subclause 7.5.5.3.(1)(a)(ii) and Table 7.4.10.3.A of the 1997 Building Code were withdrawn from the dispute upon mutual agreement between the Applicant and Respondent.

2. Provisions of the Building Code in Dispute

The following is a list of the 1997 Code provisions in dispute along with the corresponding 2006 Code references, under which the Commission reviewed the matter.

1997 Building Code

7.4.8.2. Length of Fixture Outlet Pipe

(1) Except as provided in Sentence 7.4.5.1.(3) the *developed length* of every *fixture outlet pipe* shall not exceed 900 mm (2 ft 11 in).

2006 Building Code

7.4.8.2. Length of Fixture Outlet Pipes

(1) Except for *fixture outlet pipes* installed in conformance with Sentence 7.4.5.1.(3), the *developed length* of every *fixture outlet pipe* shall not exceed 1 200 mm.

1997 Building Code

7.3.3.11. Copper Tube

(1) Types M and DWV copper tube shall not be bent.

2006 Building Code

7.3.3.10. Copper Tube

(1) Types M and DWV copper tube shall not be bent.

1997 Building Code

7.3.6.1. Tests and Inspection of Drainage or Venting Systems

(1) Except in the case of an external *leader*, after a section of *drainage system* or a *venting system* has been roughed in, and before any *fixture* is installed or piping is covered, a water or an air test shall be conducted.

2006 Building Code

7.3.6.1. Tests and Inspection of Drainage or Venting Systems

(1) Except in the case of an external *leader*, after a section of *drainage system* or a *venting system* has been roughed in, and before any *fixture* is installed or piping is covered, a water or an air test shall be conducted.

1997 Building Code

7.3.7.1. Application of Tests

(1) After a section of a *potable water system* has been completed, and before it is placed in operation, a water test or an air test shall be conducted.

2006 Building Code

7.3.7.1. Application of Tests

(1) After a section of a *potable water system* has been completed, and before it is placed in operation, a water test or an air test shall be conducted.

1997 Building Code

7.4.7.1. Cleanouts for Drainage Systems

(2) A *cleanout* fitting shall be provided on the upstream side and directly over every running *trap*.

2006 Building Code

7.4.7.1. Cleanouts for Drainage Systems

(2) A *cleanout* fitting shall be provided on the upstream side and directly over every running *trap*.

1997 Building Code

7.5.7.1. Sizes for Wet Vents

(1) Where 2 or 3 *fixtures* are installed in a *plumbing system*, any one of the *fixtures* may be *wet vented* by one or both of the other *fixtures* if

d) at least one of the *wet venting fixtures* is drained through a vertical *continuous waste and vent* and the *waste pipe* serving as a *wet vent* is at least,

(iii) 2 in. *size*, where the *wet vented trap* is of 3, 4 or 6

2006 Building Code

7.5.8.1. Hydraulic Loads Draining to Wet Vents

(1) The hydraulic load that drains to a *wet vent* shall conform to Table 7.5.8.1.

(2) When determining the *size* of a *wet vent*, the hydraulic load from the most downstream *fixture* or symmetrically connected *fixtures* shall not be included.

Table 7.5.8.1.
Maximum Permitted Hydraulic Loads Drained to a Wet Vent

Forming Part of Articles 7.5.2.1. and 7.5.8.1.

Column 1	2	3
Size of *Wet Vent*, in.	Maximum Hydraulic Load, *Fixture Units*	
	Not Serving Water Closets	Serving Not More Than Two Water Closets
		Fixtures Other Than Water Closets
1 ½	2	N/A
2	4	3
3	12	8
4	36	14
5	N/A	18
6	N/A	23

3. Applicant's Position

At the outset of the hearing, the Applicant requested that the matter be reviewed under the 2006 Building Code for sufficiency of compliance. As the Respondent had no objections to this request, the Commission agreed to review the matter under the applicable provisions of the 2006 Building Code.

The Applicant submitted that the Type M copper pipe used in the installation of the subject plumbing system was slightly bent using a half inch spring bending tool to accommodate a 2x8 floor joist. The Applicant maintained that that the pipe was bent using an appropriate tool causing no damage to the piping and that there had not been any leaks or breakage of the pipe since its installation. Further, the Applicant stated that it was common trade practice to slightly bend a Type M copper pipe whenever cold and hot water pipes are located in the same vertical plane. He argued that provided the pipes are not damaged this installation should be acceptable.

The Applicant also submitted that the developed length of the washing machine's discharge piping, which is approximately 1400 mm, is only a minor deviation from the Code's required 1200 mm length and should therefore, be considered sufficient. The Applicant argued that using a 1.5 inch ABS wet vent to serve one water closet is more than adequate, as the Code allows a 2 inch wet vent to be used to serve two water closets. The Applicant also argued that a cleanout for the laundry tub's running trap is not necessary in this particular case, as a snake can easily be inserted through the pipe by removing the washing machine hose and therefore, it is possible to clean out the trap if required.

In support of his arguments, the Applicant submitted that he had tested the plumbing system. The Applicant explained that the bathtub and vanity sink were filled with water simultaneously

and then discharged simultaneously while at the same time the lavatory was flushed. The Applicant claimed that no air bubbles were visible in either the vanity or bathtub during this test and further, the volume of water inside the P-Trap of the vanity was 250 ml before and after the lavatory was flushed. The Applicant maintained that this test confirmed that there was no siphon effect, and therefore, proved not only that the plumbing system was adequately vented but that it was also in perfect working order and did not present a threat to the public's health or safety. However, the Applicant admitted that the plumbing inspector was not present at the time of testing. During the course of the hearing, both the Respondent and Applicant agreed to repeat the tests in accordance to the requirements of the Code.

In summary, the Applicant stated that he recognized that there were deviations from the Code in the installed plumbing system but that they were very minor in nature and should therefore be allowed on the grounds that they do not present a threat to the public's health and/or safety. Further, the Applicant requested the Commission to make a ruling based on whether the Applicant's plumbing installation indeed posed a threat to public health and safety, to which the presiding members at the hearing clarified that the Commission was a tribunal in which only sufficiency of compliance with the technical requirements of the Building Code could be addressed.

4. Respondent's Position

The Respondent submitted that upon inspection of the subject plumbing system multiple Code contraventions became apparent. As a result, the Applicant was given a time frame and directed to correct the deficiencies. He was directed to contact the municipality for a re-inspection once the deficiencies had been corrected. He was further advised that if these matters were not addressed, an Order under the *Building Code* Act would be issued.

An Order to Comply was issued on March 13, 2007 listing nine Code contraventions related to the installed plumbing system. Upon responding to questions and based on the most recent inspection of the plumbing system to date, the Respondent agreed that six of the listed Code contraventions were still in dispute, namely: Sentence 7.4.8.2.(1), Sentences 7.3.3.11.(1), 7.3.6.1.(1), 7.3.7.1.(1), 7.4.7.1.(2), and Clause 7.5.7.1.(1)(d)(iii) of the 1997 Ontario Building Code.

The Respondent submitted that under the requirements of the Code, the installed water closet wet vent must be 2 inches and therefore, the Applicant's installation of a1 ½ inch wet vent was not sufficient. The Respondent stated that upon inspection it was observed that the length of the laundry tub fixture outlet pipe was in excess of 1400 mm, which was over the required maximum length of 1200 mm as prescribed by the Code and therefore, in contravention of the Code. In addition, the Respondent maintained that the Type M copper pipe had been bent in several places, and as this type of pipe was very thin, it could easily be damaged by bending it. It was his opinion that the Code is implicit that this type of piping not be bent because of how easily it can be damaged.

Further, the Respondent stated that an inspection of the as-installed laundry tub running trap revealed that it did not have a cleanout as required by the Code, therefore, a proper drain and vent was required. In addition, the Respondent stated that he could not support the tests or the results the Applicant had described, as an inspector had not been present to witness the tests. Therefore, it was his opinion that neither the drainage or venting piping nor the potable water system had been tested in accordance with the Building Code.

5. Commission Ruling No. 08-06-1180, (B-2007-49)

It is the Decision of the Building Code Commission that the plumbing system which has been installed to provide service to an additional washroom on the second floor of a two storey, Group C, residential dwelling does not provide sufficiency of compliance with Clause 7.5.7.1.(1)(a), Subclause 7.5.5.3.(1)(a)(ii), Table 7.4.10.3.A, Sentence 7.4.8.2.(1), Sentences 7.3.3.11.(1), 7.3.6.1.(1), 7.3.7.1.(1), 7.4.7.1.(2), and Clause 7.5.7.1.(1)(d)(iii),. of the 1997 Building Code at 79 Facendi Drive, City of Peterborough, Ontario.

6. Reasons

i) It is the Commission's opinion that the 1997 Ontario Building Code is applicable to this application. However, at the outset of the hearing the Applicant requested that the matter be reviewed under the 2006 Ontario Building Code for sufficiency of compliance. As the Respondent had no objections to this request, the Commission reviewed the matter under the 2006 Building Code.

ii) At the hearing, Clause 7.5.7.1.(1)(a) and Subclause 7.5.5.3.(1)(a)(ii) and Table 7.4.10.3.A of the 1997 Building Code were withdrawn from the dispute upon mutual agreement between the Applicant and Respondent. Therefore, the Commission will not rule on these items.

iii) Sentence 7.4.8.2.(1) of the 1997 Code stipulates that the developed length of every fixture outlet pipe shall not exceed 900 mm. In the 2006 Building Code, Sentence 7.4.8.2.(1) states that the developed length of every fixture outlet pipe shall not exceed 1 200 mm. The developed length of the already built laundry tub fixture outlet pipe is 1 400 mm, which exceeds the maximum length permitted by the Code.

iv) Sentence 7.3.3.11.(1) of the 1997 Code referenced as Sentence 7.3.3.10.(1) in the 2006 Building Code, both identically state, "Types M and DWV copper tube shall not be bent". The Code is explicit that type M copper tube shall not be bent. The Commission was advised that the Type M copper tube had been "slightly bent" in the subject plumbing system installation. Therefore, the Commission has determined that sufficiency of compliance with the requirement of the 1997 or the 2006 Building Code has not been achieved.

v) Sentence 7.3.6.1.(1) of the 1997 Code, referenced as Sentence 7.3.6.1.(1) in the 2006 Code, both equivalently state, "Except in the case of an external *leader*, after a section of *drainage system* or a *venting system* has been roughed in, and before any *fixture* is installed or piping is covered, a water or an air test shall be conducted." The Commission was advised that the building inspector was not present during the time when the tests were conducted and therefore, could not verify the results. The Commission was further advised that the tests would be redone in accordance with the Code requirements. Therefore, the Commission will not rule on this item.

vi) Sentence 7.3.7.1.(1) of the 1997 Code and referenced as Sentence 7.3.7.1.(1) in the 2006 Code, both require that a water test or an air test be conducted after a section of a *potable water system* has been completed, and before it is placed in operation. The Commission was advised that the building

inspector was not present during the time when the tests were conducted and therefore, could not verify the results. The Commission was further advised that the tests would be redone in accordance with the Code requirements. Therefore, the Commission will not rule on this item.

vii) Sentence 7.4.7.1.(2) in the 1997 Code and Sentence 7.4.7.1.(2) in the 2006 Code both state, “A *cleanout* fitting shall be provided on the upstream side and directly over every running *trap*”. The subject plumbing system does not include a cleanout trap directly over every running trap. The Code is specific in this requirement; the Commission finds that sufficiency of compliance with the Code is not achieved.

viii) Subclause 7.5.7.1.(1)(d)(iii) of the 1997 Code, referenced as Sentence 7.5.8.1.(1) in the 2006 Code, states that the hydraulic load that drains to a *wet vent* shall conform to Table 7.5.8.1. By virtue of Table 7.5.8.1., the minimum size of a wet vent serving not more than two water closets, and up to three fixtures other than water closets, is 2 inches in size. The subject plumbing system having a 1 ½ inch wet vent installed to serve one fixture, which is a water closet, does not meet the minimum requirement of the Code.

ix) There were no acceptable compensating measures offered by the Applicant, therefore, it remains that the subject installed plumbing system does not provide sufficiency of compliance with the Ontario Building Code, which is a minimum set of construction requirements.

Ruling No. 08-07-1181
Application No. B-2007-50

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 3.2.9.4.(2) of the Regulation 350/06, as amended, (the Building Code).

AND IN THE MATTER OF an application by Al Cook, Greater Essex County District School Board for the resolution of a dispute with William Jean, A/Chief Building Official, City of Windsor, to determine whether the proposal to remove the fire hoses from the fire hose cabinets of a Group A, Division 2 assembly occupancy provides sufficiency of compliance with Sentence 3.2.9.4.(2) of the Building Code at 1800 Liberty Street and 1601 Norfolk Street, City of Windsor, Ontario.

APPLICANT	Al Cook Greater Essex County District School Board Windsor, ON
RESPONDENT	William Jean A/Chief Building Official City of Windsor
PANEL	Tony Chow, Chair Gerry Egberts Prabhakar Mahant
PLACE	Toronto, Ontario
DATE OF HEARING	February 7, 2008
DATE OF RULING	February 7, 2008
APPEARANCES	Al Cook Greater Essex County District School board Windsor, ON **The Applicant** David Hine Hine Reichard Tomlin Inc. Markham, ON **Agent for the Applicant** William Jean A/Chief Building Official City of Windsor **The Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for a permit under the *Building Code Act*, *1992*, to remove the existing 38 mm diameter fire hose stations of the standpipe systems in two schools in the City of Windsor, Massey Secondary School at 1800 Liberty Street and Glenwood Public School at 1601 Norfolk Avenue.

The subject buildings are Group A, Division 2 Major Occupancies, Massey Secondary School is three storeys in building height and approximately 1500 m² in building area. Glenwood Public School is two storeys in building height and approximately 2000 m² in building area. Both schools are of combustible and non-combustible construction, have a standpipe and hose system with fire hose cabinets, a fire alarm, but neither school is sprinklered.

The construction in dispute involves whether the proposal to remove the fire hoses from the fire hose cabinets of a Group A, Division 2 assembly occupancy provides sufficiency of compliance with Sentence 3.2.9.4.(2) of the Building Code at 1800 Liberty Street and 1601 Norfolk Street, City of Windsor, Ontario**.**

2. Provisions of the Building Code in Dispute

3.2.9.4. Hose Stations

(2) Each hose station shall be equipped with a hose rack filled with not more than 30 m of 38 mm diam fire hose and the hose rack and fire hose shall be,

(a) *listed*, or

(b) approved by the Factory Mutual Research Corporation.

3. Applicant's Position

The Agent for the Applicant submitted a report titled, "Evaluation of the Effectiveness of Fire Hoses in Assembly Buildings", which was prepared for the Greater Essex District School Board by Hine Reichard Tomlin Inc. for the Commission's review.

The Agent submitted that the School Board had partnered with the University of Windsor to fund the report, as both organizations had similar goals with respect to this matter and similar building occupancies. The report was intended to be used as the rationale to support the removal of fire hoses from fire hose cabinets in assembly occupancy buildings.

The Agent argued that fire hose cabinets without a fire hose, provide the equivalent level of safety, to that of a fire hose cabinet with a fire hose. In fact, he argued that buildings without fire hoses would perform better than buildings equipped with fire hoses. The Agent explained that the presence of a fire hose in a fire hose cabinet suggests that it is there to be used. However, in the schools, the role of teachers and administrators is to get the students out of the building, quickly and safely. The Agent stated that the Board of Education does not train its staff or occupants in the operation or use of fire hoses and further the Fire Safety Plans in place for these buildings do not advise occupants to use the fire hoses. The Agent maintained that most importantly, the use of a fire hose by an untrained individual could increase the potential for fire growth and injury to the user and/or other occupants of the building.

Further, the Agent argued that Fire Department Personnel do not rely on the fire hoses within

the fire hose cabinets as they are considered untrustworthy. Rather, the Agent explained that firefighters carry their own lengths of reliable fire hose, as these hoses are tested regularly and maintained properly. Further, the Commission was told that firefighters disconnect the fire hose supplied in a fire hose cabinet and then connect their own more reliable hose to the hose valve. The Agent argued that the common practice of having firefighters disconnect the existing fire hose and then connecting their own hose to the hose valve adds valuable time in an emergency situation and delays firefighting efforts.

In addition, the Agent declared that in older buildings the standard for the standpipe system vary significantly, therefore the water supply from a standpipe system in a small building is very unpredictable and thus responding firefighters often use the hose lines directly from the fire trucks. The Agent further claimed that firefighters often use charged hoses from the fire trucks in small buildings, up to three storeys in building height, as the location of the fire hose cabinets is less predictable and so rather than wasting valuable time, firefighters will opt to use the charged hoses from their trucks.

Further, the Agent presented that other Canadian Building Codes such as: the 2006 International Building Code, 1997 Alberta Building Code, and the 1998 British Columbia Building Code, require the design and installation of a standpipe system to be in conformance with NFPA 14, and although they require hose connections to be provided, they do not specifically require the need to provide a fire hose. Therefore, the proposal to eliminate fire hoses from fire hose cabinets is consistent with other Canadian legislation.

In summary, the Agent maintained that, for the following reasons, the removal of the fire hoses from the fire cabinets achieves a performance level equal to compliance with Section 3.2.5. of the Ontario Building Code:

- The time it takes to disconnect an existing hose increases the time for fire suppression
- Having a fire hose in the cabinet is a temptation for an untrained occupant to use the hose, which could cause injury
- In responding to fires in small buildings, firefighters generally use hoses connected to the pumper trucks
- The location of fire hose cabinets in older buildings is unpredictable

Therefore, the Agent concluded that buildings without fire hoses will perform better than a building equipped with a fire hose.

4. Respondent’s Position

The Respondent submitted that on September 25, 2007, a building permit application along with a report from Hine Reichard Tomlin Inc. were received by the City of Windsor’s Building Department for the removal of the fire hoses from the fire hose cabinets at 1800 Liberty Street and 1601 Norfolk Street. On October 4, 2007, the building department refused the permit applications.

The Respondent explained that the reason for denying the building permit was that Sentence 3.2.9.4.(2) of the Ontario Building Code was explicit, in that it states that each hose station shall be equipped with a hose rack filled with not more than 30 m of 38 mm diameter hose.

The Respondent indicated that in theory, the municipality concurred with the report by Hine Reichard Tomlin, however, the code provision is explicit and therefore, the buildings must be equipped with hoses.

5. Commission Ruling

It is the Decision of the Building Code Commission the proposal to remove the fire hoses from the fire hose cabinets of a Group A, Division 2 assembly occupancy does not provide sufficiency of compliance with Sentence 3.2.9.4.(2) of the Building Code at 1800 Liberty Street and 1601 Norfolk Street, City of Windsor, Ontario.

6. Reasons

i) By virtue of the provision outlined in Article 3.2.9.1. of the Building Code, the subject buildings are required to be equipped with a standpipe system.

ii) Sentence 3.2.9.4.(2) of the Ontario Building Code requires that each hose station be equipped with a hose rack filled with not more than 30 m of 38 mm diameter fire hose. In the opinion of the Commission, this provision of the Code is explicit.

iii) The subject buildings are not sprinklered.

iv) There were no compensating measures offered that were adequate to provide sufficiency of compliance with the Code.

Dated at Toronto this **7th** day in the month of **February** in the year **2008** for application number **2007-50.**

Application No. B-2007-48

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 6.2.1.4. of the Regulation 403, as amended, (the Building Code).

AND IN THE MATTER OF an application by Krista Wells, Homeowner for a resolution of a dispute with Philip Gerrard, Chief Building Official, Municipality of North Grenville, to determine whether the as-installed ground source heat pump/geothermal system provides sufficiency of compliance with Article 6.2.1.4. of the Building Code at 14 Kimberley Road, Township of North Grenville, Ontario.

APPLICANT	Krista Wells Homeowner Kemptville, ON
RESPONDENT	Philip Gerrard Chief Building Official Municipality of North Grenville
PANEL	Tony Chow, Chair Gerry Egberts Prabhakar Mahant
PLACE	Toronto, Ontario
DATE OF HEARING	February 7, 2008
DATE OF RULING	February 7, 2008
APPEARANCES	Krista Wells Homeowner Kemptville, ON **The Applicant** Philip Gerrard Chief Building Official Municipality of North Grenville **The Respondent** Randy Wilkinson Building Inspector Municipality of North Grenville **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Order to Comply under the *Building Code Act*, *1992*, which required the Applicant to submit a permit fee, a hygrogeological report from an engineer, and further requested that a building permit be obtained at 14 Kimberley Road, Township of North Grenville, Ontario.

The subject building is a Group C major occupancy, single detached home that is approximately 232 m² in size.

The construction in dispute relates to whether the installation of a horizontal, closed-loop, ground source heat pump/hydro geothermal system, used to replace an existing oil furnace, provides sufficiency of compliance with Article 6.2.1.5.(3) of the 1997 Building Code at 14 Kimberley Road, Township of North Grenville, Ontario.

2. Provisions of the Building Code in Dispute

6.2.1.5. Installation Standards

(3) The design and installation of ground and water source heat pumps shall conform to CAN/CSA-C445-M, "Design and Installation of Earth Energy Heat Pump Systems for Residential and Other Small Buildings" where

(a) the maximum standard rated output is 35 kW (119,000 Btu/h) per *dwelling unit* for residential applications, or

(b) small *building* applications serve a heated floor space area not greater than 1 400 m² (15,100 ft^2).

3. Applicant's Position

The Applicant stated that in June of 2006, the TSSA conducted an inspection of the oil furnace at her home. As a result of this inspection, the existing oil furnace was deemed an "Immediate Hazard". She subsequently decided not to replace the oil furnace and instead opted to install a new horizontal, closed-loop, ground source heat pump.

The Applicant claimed that upon inquiring on how to apply for the permit, she was advised by the Designate for the Respondent that an application form along with the installer's information, the type of heating unit, heating fluid type, sketch of pipe layout, pipe specifications from the manufacturer, the Material Safety Data Sheet regarding the heating fluid, and information on the lot and septic system would be required. The Applicant maintained that in fact all of the above required information was submitted to the municipality on July 20, 2006 when the application for a permit was made but admitted that the permit fee had not been submitted with the application.

According to the Applicant, on July 26, 2006, during a visit to the municipal office, she was verbally informed that the permit was denied because the heating fluid proposed, known as Ancool 100 was "toxic" based on the Material Safety Data Sheet she had submitted. The Applicant argued that according to the Ministry of Environment, Ancool 100, also known as denatured alcohol, was a standard industry fluid currently used for ground source heat pumps. Further, in response to questioning, the Applicant maintained that the installed heating system was not only running very well and efficiently but also advised the Commission that her system was equipped with a pressurized closed loop system that would automatically shut down, should the system encounter a leak or break in the line.

The Applicant explained that during a subsequent discussion with the installer of the heating system, she was advised that water could be used as an alternative heat transfer fluid in the heating system. Further, she was told that the Designate for the Respondent had agreed to this solution. However, upon visiting the municipal office on July 31, 2006, assuming that her proposal had been accepted, the Applicant was advised that the proposal did not meet the Ontario Building Code. The Applicant claimed that after various attempts to contact the Respondent, in order to receive a more detailed explanation as to why the permit had been denied, the Respondent informed the Applicant that the proposal did not meet the requirements of the CAN/CSA –C448.2-02 Standard.

The Applicant argued that the contractor had met the requirements for installation under the CAN/CSA –C448.2-02 Standard and further, since the closed-loop ground source heating system did not involve ground water, well extraction and had no contamination issues, the requirement for a hydrogeological report was not necessary.

The Applicant explained that after various conversations with different professionals, reaching no resolution with the municipality, and with winter approaching, she consented to the installation of the closed-loop ground source heat pump. As a result, on November 16, 2006, the Applicant received an Order to Comply for installing the ground source heat pump without a permit. The Order required the Applicant to provide a hydrogeological engineer report, to remit permit fees, and to obtain a building permit.

The Applicant informed the Commission that in an effort to comply with the Order she solicited the assistance of W.B. Beatty and Associates Ltd. to obtain a hydrogeological report, which outlined the geology and groundwater resources in the Kemptville area, and then submitted the report to the municipality on December 19, 2006.

The Applicant claimed that without being informed, the municipality had contracted Gorrell Resource Investigations to conduct a peer review of the hydrogeological report and then later invoiced her for the cost of having the peer review completed. The Applicant further submitted that on January 15, 2007, she received a letter from the Designate to the Respondent stating that a construction permit could not be issued for the following reasons: non payment of fees, the hydrogeology report was found to be unsatisfactory and not in accordance with the CAN/CSA –C448.2-02 Standard, a performance deposit agreement needed to be completed, and a site plan, drawn to scale, showing the location of all proposed piping and equipment relative to the lot lines, the septic system and the utilities was required.

The Applicant submitted that in a further attempt to acquire a satisfactory hydrogeology report, she contacted the Ministry of Environment but was later informed that no record of a hydrogeology report could be found for her subdivision. The Applicant also informed the Commission that on March 15, 2007 she received a copy of a hydrogeological report of North Grenville Township, which was provided to her legal representative by the Designate of the Respondent. The applicant questioned the need for her to obtain this report if the municipality already had a copy. However, being advised that the required hydrogeological report should contain specific information outlined in the CAN/CSA Standard, the Applicant explained that in a continued effort to obtain a hydrogeological report that would satisfy the municipality, she contacted an environmental engineer in the Kemptville area. The engineer informed the Applicant that he was not aware of what relevant information would be needed in such a report that had not already been provided in the original report.

In summary the Applicant explained that she was seeking a resolution to obtain a building permit for the as-installed ground source heat pump and maintained that despite her many attempts to satisfy the municipality that the installed ground source heat pump complies with the Code, her permit has been denied.

4. Respondent's Position

The Respondent submitted that the Applicant applied for a building permit to install a ground source heat pump system, in accordance with Article 6.2.1.4. of the 2006 Ontario Building Code on July 20, 2006. Therefore, the design and installation of the system would need to comply with the CAN/CSA –C448.2-02 Standard.

As a result, the Applicant was later advised that a hydrogeological report was required in support of the permit application. Further, the proposed heating fluid, Ancool 100, for the ground source heat pump contained hazardous ingredients and the proposal of the use of water as a heat transfer fluid would be insufficient as water would freeze.

The Respondent confirmed that a hydrogeological report was submitted by the Applicant and peer reviewed by the municipality's consultant, who indicated that the report did not satisfy the requirements of the CAN/CSA –C448.2-02 Standard and further that the report contained errors. It was on this basis that the permit was not issued. The Respondent also explained that the municipality had the authority to apply costs for the peer review of the hydrogeologcal report under Municipal Bylaw 14-98., Section 3.11, which states, "The Chief Building Official may require and Engineer's report or soils investigation be conducted at the applicant's expense for any stage of construction, renovation or demolition". Further, the Commission heard that the Applicant was advised by letter on Feb 5, 2007 that the engineer's hydrogeological report should address specific sections of the CAN/CSA Standard and these specific requirements were outlined in the municipality's letter.

The Respondent also informed the Commission that the "rough sketch" submitted with the permit application on July 20, 2006 was not considered to be a required site plan due to its lack of detailed information such as; being drawn to scale, location of all piping and equipment relative to lot lines, septic system, neighbouring wells and utilities. Further, the Respondent argued that contrary to the Applicant's submission, the installer had failed to provide a site plan to the municipality. The Respondent contended that the Applicant's application for a permit was still considered incomplete as the Applicant had also failed to pay a $500.00 Performance Deposit, as originally communicated to the Applicant in the letter of January 15, 2007.

The Respondent stated that as the Applicant's contractor proceeded to install the ground source heat pump without a permit or inspections, the municipality then laid charges against both the Applicant and the contractor. The Commission heard that the contractor plead guilty to the charges and stipulated to a fine and that charges against the Applicant were still pending.

In response to questions, the Respondent conceded to have the Commission review the dispute under the 1997 Building Code. Therefore, by virtue of Sentence 6.2.1.5.(3), CAN/CSA-C445-M would be the applicable Standard. However, the Respondent maintained that the safety of the system was the major concern, in particular the heat transfer fluid known as Ancool 100, contained hazardous ingredients and if there were to be a break in the heating system's line, it could potentially contaminate the ground water and the Applicant's well.

In summary, the Respondent stated that under the *Building Code Act*, he could not issue a permit after an installation has taken place, as he would need to verify that the installation complied with the Code. Further the Respondent stated that to inspect the system to determine if it was in compliance with the Code, the system would need to be partially uncovered at the Applicant's expense.

5. Commission Ruling

It is the Decision of the Building Code Commission that the as-installed ground source heat pump/geothermal system provides sufficiency of compliance with Article 6.2.1.5.(3) of the 1997 Ontario Building Code at 14 Kimberley Road, Township of North Grenville, Ontario, on condition that:

a) A suitably qualified person shall inspect and verify that the as-installed components of the closed-loop ground source heat pump/hydro geothermal system conform to the National Standard of Canada, CAN/SCA-C445-M standard. The Chief Building Official shall be notified and may be present to witness this inspection.

b) A suitably qualified person shall verify that the closed-loop ground source heat pump/hydro geothermal has been designed and installed in accordance with Article 6.2.1.1, *Good Engineering Practice*, of the 1997 Ontario Building Code. The Chief Building Official shall be notified and may be present to witness this inspection.

6. Reasons

i) It is the opinion of the Commission that since the application for the permit was made on July 20, 2006, the 1997 Ontario Building Code is applicable to the installation of the subject system. As a result, the 1997 Building Code references CAN/SCA-C445-M Standard, *"Design and Installation of Earth Energy Heat Pump Systems for Residential and Other Small Buildings"* as the applicable standard for the design and installation of the ground source heat pump.

ii) In the opinion of the Commission, neither the Building Code nor the CAN/CSA C445-M Standard specifically requires that a hydrogeological report be provided. However, the Commission was advised that the Applicant did provide a hydrogeological report as requested by the municipality.

RULING

1. Particulars of Dispute

The Applicant has received a permit under the *Building Code Act*, *1992*, to construct 5 separate, 4 storey, Group C residential buildings at 1, 2, 3, 4, and 5, Maple Crossing Condominiums, 1479 Maple Avenue, Town of Milton, Ontario.

The subject buildings are of combustible construction and are equipped with a sprinkler system, a standpipe and hose system and a fire alarm system. Each building has between 48 and 56 residential units with a total of 264 units. All suites within each building are provided with a single exit doorway opening onto a public corridor.

Sentence 3.3.1.3.(8) of the 1997 Building Code requires each suite in a floor area that serves more than one suite to have an exterior exit doorway or a doorway into a public corridor or in to an exterior passageway. Sentence 3.3.1.3.(9) requires that where a doorway referred to in Sentence (8) opens onto a public corridor or exterior passageway, it shall be possible to go in opposite directions to each of two separate exits. “Exit”, as defined by the Code, is that part of a means of egress that leads from the floor area it serves to an exterior open space protected from fire exposure from the building and having access to an open public thoroughfare.

The construction in dispute involves the exit and egress system provided for each suite in each building. More specifically, the dispute involves whether a fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system is required. Each suite, in the subject buildings, has a doorway that exits onto a public corridor; the corridor is served by a fully enclosed exit stair in one direction. In the opposite direction, the public corridor ends at an unrated exterior passageway. Evacuees must travel through the unrated exterior passageway to reach an enclosed exit stair. The exterior passageway is adjacent to tenant occupied balconies and is separated from the balconies by an open guard. The Applicant wishes the Commission to consider the exterior passageways as one of the two required means of egress from the dwelling units. The Respondent is of the opinion that as the exterior passageways include tenant occupied space containing combustible materials and content, and as they are not separated from the rest of the building as required by Sentence 3.4.4.1.(1), the proposed exterior passageways, without a fire rated shutter between the tenant balconies and the exterior passageway, can not be considered equivalent to a sprinklered and fire separated internal public corridor.

2. Provisions of the Building Code in Dispute

3.3.1.3. Means of Egress

(8) Except as permitted by Sentences 3.3.4.4.(6) and (7), each suite in a floor area that contains more than one suite shall have
- (a) an exterior exit doorway, or
- (b) a doorway
  - (i) into a public corridor, or
  - (ii) to an exterior passageway.

(9) Except as permitted by this Section and by Sentence 3.4.2.1.(2), at the point where a doorway referred to in Sentence (8) opens onto a public corridor or exterior passageway, it shall be possible to go in opposite directions to each of 2 separate exits.

3.3.1.4. Public Corridor Separations

(1) Except as otherwise required by this Part or permitted by Sentences (2) to (7), a *public corridor* shall be separated from the remainder of the *building* by a *fire separation* having a *fire-resistance rating* not less than 1 h. (See Appendix A.)

(2) The *fire-resistance rating* of a *fire separation* between a *public corridor* and the remainder of a *floor area* is permitted to be less than 1 h but not less than 45 min provided the *fire-resistance rating* required by Subsection 3.2.2. is permitted to be less than 1 h for

(a) the floor assembly above the *floor area*, or
(b) the floor assembly below the *floor area*, if there is no floor assembly above.

(3) If a *floor area* is *sprinklered*, no *fire-resistance rating* is required for a *fire separation* between a *public*

3.3.1.14. Exterior Passageways

(1) An exterior passageway leading to a required *exit* shall conform to the requirements of Section 3.4. for exterior *exit* passageways.

3.4.4.1. Fire-Resistance Rating of Exit Separations

(1) Except as permitted by Sentences (2), (4), 3.3.5.4.(3), 3.4.4.2.(2) and 3.4.4.3.(1), every exit shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than that required by Subsection 3.2.2., but not less than 45 min, for
(a) the floor assembly above the storey, or
(b) the floor assembly below the storey, if there is no floor assembly above.

(2) The fire-resistance rating of the fire separation referred to in Sentence (1) need not be more than 2 h.

(3) If an exit stair in an assembly hall or theatre serves more than one balcony level, the exit stair shall be separated from the remainder of the building in conformance with Sentence(1).

(4) The path of exit travel may lead from an exit door or exit enclosure through open air parking that is located below a roof or floor assembly that is part of the building served by the exit door or exit enclosure where
(a) the portion of the path of exit travel that leads through the open air parking is not more than 9 m (29 ft 6 in) in length measured from the exit door to a point at ground level at the perimeter of the building,
(b) measures are taken to prevent vehicles intended to park in spaces adjacent to the path of exit travel from encroaching on the path of exit travel, and
(c) an alternate means of egress not leading through the open air parking is available from the interior side of the door opening onto the path of exit travel through the open air parking area.

3.4.4.3. Exterior Passageway Exceptions

(1) The requirements of Sentences 3.4.4.1.(1) and 3.2.3.12.(1) and (3) do not apply to an exterior *exit* passageway provided
(a) not less than 50% of the exterior side is open to the outdoors, and

(b) an *exit* stair is provided at each end of the passageway.

3.4.4.4. Integrity of Exits

(1) A *fire separation* that separates an *exit* from the remainder of the *building* shall have no openings except for

(a) standpipe and sprinkler piping,
(b) electrical wires and cables, totally enclosed *noncombustible* raceways and *noncombustible* piping that serve only the *exit*,
(c) openings required by the provisions of Subsection 3.2.6.,
(d) *exit* doorways, and
(e) wired glass and glass block permitted by Article 3.1.8.14.

(2) *Exits* within scissors stairs and other contiguous *exit* stairways shall be separated from each other by a smoke-tight *fire separation* having a *fire-resistance rating* not less than that required for the floor assembly through which they pass.

(3) *Fire separations* separating contiguous stairs described in Sentence (2) shall not be pierced by doorways, ductwork, piping or any other openings that affect the continuity of the separation.

(4) A fuel-fired *appliance* shall not be installed in an *exit*.

(5) An *exit* shall not be used as a *plenum* for a heating, ventilating or air-conditioning system.

(6) An *exit* shall be designed for no purpose other than for exiting, except that an *exit* is permitted also to be designed to serve as an access to a *floor area*.

(7) A *service room* shall not open directly into an *exit*.

(8) Storage rooms, washrooms, toilet rooms, laundry rooms and similar ancillary rooms shall not open directly into an *exit*.

(9) *Service spaces* referred to in Sentence 3.2.1.1.(7) shall not open directly into an *exit*.

(10) In elementary and secondary schools, an *exit* shall be designed so that it does not serve as an access from one portion of a *floor area* to another portion of the same *floor area*.

3. Applicant's Position

The Agent submitted that the design concept for the exiting of occupants from each suite of the subject buildings is in dispute. The Agent explained that each suite accesses a public corridor that in one direction leads to an enclosed exit stair and in the other direction leads to an exterior passageway, which is more than 50% open to the exterior on one side and which then leads to an enclosed exit stair.

The Agent contended that the Building Code equates an open exterior passageway that is 50% open to the exterior, not fire separated from the remainder of the floor area, and has an exit stair at each end, to a 1 h fire separated public corridor. In other words, the Agent maintained that under the Building Code, an exterior passageway which opens to the exterior with an exit stair at each end and which is not fire separated from the remainder of the floor as per Article 3.4.4.3., can be viewed as equivalent to a 1 h fire separated corridor.

The Agent argued that Sentence 3.3.4.4.(7) of the Code permits a dwelling unit which has a second and separate means of egress to have one means of egress from the dwelling unit passing through an exterior balcony or exterior passageway served by a single exit stairway.

The Agent advised that individual balconies or terraces are not intended to be considered a means of egress from the suites to the open passageway. He submitted that Sentence 3.3.1.5.(1) of the Code requires a minimum of two egress doorways from a room or suite however, this Sentence provides dwelling units with an exception to this requirement. Therefore, he stated that only one egress doorway is required for dwelling units. The means of egress being proposed is via the egress door of the suite, which in one direction leads to an enclosed public corridor and then to an enclosed exit stair and in the other direction leads to the enclosed public corridor, which then leads to an exterior passageway, and finally to an enclosed exit stair.

The Agent stated that Sentence 3.3.1.8.(8) of the Building Code requires suites in a floor area containing more than one suite (such as this building) to have either an exterior exit doorway or a doorway which opens into a public corridor or to an exterior passageway and that Sentence 3.3.1.14.(1) states that an exterior passageway leading to a required exit shall conform to the requirements of Section 3.4 for exterior exit passageways. The Agent submitted that although the term “exterior passageway” is not defined in the Code, Article 1.1.3.2. defines a “public corridor” as a corridor that provides access to more than one suite. Therefore, as the corridors at Maple Crossing provide access to more than one suit, it is his belief that they are considered public corridors. Further, the Agent advised that it was his opinion that a portion of a public corridor can contain an exterior passageway.

The Agent maintained that the subject exit design meets the requirements of Sentence 3.3.1.3.(9) of the Code which requires that where a doorway opens onto a public corridor or exterior passageway, it shall be possible for an individual to travel in opposite directions to each of two separate exits. The Agent argued that the subject egress design from the suites at Maple Crossing allows an individual to travel in opposite directions to two separate exits i.e. one can enter the public corridor and from there can travel to an enclosed exit stair or one can choose to travel via the exterior passageway, which leads to an enclosed exit stair.

The Agent submitted that the enclosed portions of the public corridor have a fire separation with a fire resistance rating of 1 hour with the doors having a 20 minute fire protection rating and self-closing devices in accordance with Sentence 3.3.1.4.(1) of the Building Code. The Agent acknowledged that although the exterior passageway is 50% open to the exterior, the passageway does not have an exit stair at each end as required by Article 3.4.4.3. of the Code. However, in the Agent’s opinion, the subject design, which includes an enclosed exit stair in the centre of the exterior passageway and access to an enclosed 1 hour fire rated public corridor leading to an enclosed exit stair, meets the intent of the Code for this portion of the means of egress. In fact, he argued, the subject design exceeds the Code requirement as the Code permits open stairs at either end of an exterior exit passageway, which could cause the stairs to be potentially exposed to fire from adjacent storeys or suites. Further, the Agent argued that smoke containment considerations are mitigated by the provision of a portion of the corridor being exterior and a portion being interior since the exterior passageway is open to the outside, smoke accumulation would be reduced.

The Agent acknowledged the Respondent’s concerns regarding the potential for combustibles and/or ignition sources to accumulate on the balconies adjacent to the exterior passageway, which could then potentially present a hazard to the occupants using the exterior passageway for exiting during a fire. To address this concern, the omission of the fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system the Agent offered the following compensating measures:

- The condominium documents would prohibit any sources of ignition including barbeques and type of vegetation from being present on balconies
- The balconies would be protected by automatic sprinklers, and
- Ventilation ductwork from the suite would be extended to the exterior of the passageway using fire rated ductwork

In summary, the Agent maintained that the subject egress system can be considered a combination of a public corridor and exterior passageway with those portions of the enclosed public corridor meeting the requirements of a 1hour fire separated public corridor and those portions exterior being considered equivalent to an exterior exit passageway. In both cases, he maintained, the enclosed exit stairs are provided within the required travel distances such that no dead end conditions exist and an occupant is always provided with the choice of two directions of travel. For all these reasons, the Agent contended the proposed design without a fire rated shutter between the tenant balconies and the exterior passageway, provides sufficiency of compliance with the egress and exiting requirements of the Building Code.

4. Respondent's Position

The Respondent submitted that the Building Code requires a public corridor to be served by exit stairs at each end and that Clause 3.3.1.3.(8)(b) of the Code requires one to choose either a doorway into a public corridor or a doorway into an exterior passageway (emphasis added) not a combination of both.

The Respondent advised that each suite at Maple Crossing has a door opening into a public corridor; however, the corridor is only served by a fully enclosed exit stair in one direction and not in the opposite direction as required by the Code. The Respondent argued that in the other direction, the public corridor ends at an unrated exterior passageway where evacuees must travel thorough the unrated exterior passageway then through an elevator lobby to reach an enclosed exit stair. Further the Respondent argued that the exterior passageway is shared by tenant occupied patios that could contain combustibles and ignition sources, which is a concern as the tenant patios are only separated from the exterior passageway by an open railing. The Respondent maintained that as the exterior passageways are not separated from the remainder of the building as required by Sentence 3.4.4.1.(1) of the Building Code, they cannot be considered equivalent to the sprinklered and fire separated internal public corridor. The Respondent indicated that he believed the level of life safety for an occupant would be reduced by the proposed egress system. The Respondent stated that is was his view the proposed egress design requires the occupants to pass through an area of relatively greater hazard before they could reach the exit.

The Respondent advised that to resolve this issue, it was the Municipality's position that the exterior passageways be sprinklered and fire rated shutters be installed from the floor to the underside of the slab immediately adjacent to the open guards/handrails so that if activated in a fire event, the shutters would fire separate the suites and the patios from the exterior passageways. In combination with sprinklering the passageway and ducting the HVAC and vent/exhaust system systems in fire separated duct shafts, it was the Respondent's opinion that these measures would provide sufficiency of compliance with the Code. Further, the Respondent maintained that the applicant had agreed to these measures and that the building permits were issued on this basis.

In summary, the Respondent submitted that it was his position that the proposed exterior passageways, which include tenant occupied space that would likely contain combustible materials, if not separated from the rest of the building as required by Sentence 3.4.4.1.(1) of the Code, could not be considered equivalent to a sprinklered and fire separated internal public

corridor.

5. Commission Ruling

It is the Decision of the Building Code Commission that the omission of the fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system provides sufficiency of compliance with Articles 3.4.4.1., 3.4.4.3., Sentences 3.3.1.3.(8), 3.3.1.3.(9), 3.3.1.4.(1), 3.3.1.14.(1) and 3.3.4.4.(7) of the Building Code at Buildings 1, 2, 3, 4, and 5, Maple Crossing Condominiums, 1479 Maple Avenue, Town of Milton, Ontario on condition that:

a) Automatic sprinklers shall be installed on the side wall of each balcony, in the recycling rooms, garbage rooms and resident storage rooms as well as, the exterior passageway in accordance with the standards set out by the National Fire Protection Association (NFPA) 13R-1999, *Standards for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height,*

b) The recycling rooms, garbage rooms and the resident storage rooms shall be equipped with doors, having self-closing devices and latches, which provide a minimum fire protection rating of 45 minutes. Further, the recycling rooms, garbage rooms and the resident storage rooms will be separated by a minimum 1 hour fire separation,

c) The bathroom exhaust fans, which discharge onto the exterior passageway, shall be equipped with a listed fire damper,

d) Exit signs shall be placed throughout the public corridor and exterior passageway in the proposed exit and egress system, clearly showing the direction of exit travel, and

e) The doors at each end of each exterior passageway shall have a minimum fire protection rating of 45 minutes.

6. Reasons

i) In the opinion of the Commission, the omission of the fire rated shutter with the implementation of the above-mentioned compensating measures, provides sufficiency of compliance with the Building Code requirements.

ii) The enclosed exit stairs are within the required travel distances such that no dead end conditions exist and occupants are always provided with the choice of two directions of travel.

iii) The exterior passageway, as it is more than 50% open, would reduce smoke accumulation in the means of egress.

DATE OF HEARING	January 17, 2008
DATE OF RULING	January 17, 2008
APPEARANCES	Jason Kalbe Kalbe Contracting Parry Sound, ON **The Applicant** Robin Allen Chief Building Official North Bay Mattawa Conservation Authority **The Respondent** Rick Brier Building Inspector North Bay Mattawa Conservation Authority **The Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for a building permit under the *Building Code Act*, *1992*, and is proposing to construct a Class 4 sewage system having a clearance distance of 12 m from the leaching bed to the lake. The issue is whether the clearance distance from the leaching bed provides sufficiency of compliance with Division B, Sentences 8.2.1.6.(1) and 8.2.1.6.(2), Tables 8.2.1.6.A. and 8.2.1.6.B. of the Building Code at 811-117 Water Access on McMichael Island in Salmon Lake Lot 27, Concession 3, Seguin Township Ontario.

The subject island is currently vacant, with no existing structures, buildings or sewage disposal systems. However, the installation of the Class 4 sewage system at issue is proposed to serve a seasonal one bedroom cottage, 99 m² in size, and containing 7.5 fixture units with a total daily design sewage flow of 750 L/day.

The construction in dispute involves the proposed installation of a Class 4 sewage system meeting the minimum clearances as set out in the Ontario Building Code, Division B Tables 8.2.1.6.A and 8.2.1.6.B. Specifically, the dispute revolves around the clearance distance of the distribution pipe to the lake. Article 8.2.1.6. of the Code sets out the minimum horizontal clearance distances for all components of a sewage system. By virtue of Table 8.2.1.6.B., a minimum clearance distance of 15 m from the distribution piping to the lake must be provided, By virtue of Table 8.2.1.6.A, a minimum clearance distance of 15 m from the treatment unit to the lake must be provided. Therefore, the issue in dispute is whether a reduced clearance distance of 12 m to the lake provides sufficiency of compliance with Sentences 8.2.1.6.(1), 8.2.1.6.(2), Tables 8.2.1.6.A. and 8.2.1.6.B. of the Building Code.

2. Provisions of the Building Code in Dispute

8.2.1.6. Clearances for a Class 4 or 5 Sewage System

(1) Except as provided in Sentences 8.2.1.4.(1) and (2), a *treatment unit* shall not be located closer than the minimum horizontal distances as set out in Table 8.2.1.6.A.

Table 8.2.1.6.A.
Minimum Clearances for Treatment Units

Forming Part of Sentence 8.2.1.6.(1)

Column 1	Column 2
Object	Minimum Clearance, m
Structure	1.5
Well	15
Lake	15
Pond	15
Reservoir	15
River	15
Spring	15
Stream	15
Property Line	3

(2) Except as provided in Sentences 8.2.1.4.(1) and (2), a *distribution pipe* shall not be located closer than the minimum horizontal distances set out in Table 8.2.1.6.B. and these distances shall be increased when required by Sentence 8.7.4.2.(9).

Table 8.2.1.6.B.
Minimum Clearances for Distribution Piping

Forming Part of Sentence 8.2.1.6.(2)

Column 1	Column 2
Object	Minimum Clearance, m
Structure	5
Well with a watertight casing to a depth of 6 m	15
Any other well	30
Lake	15
Pond	15
Reservoir	15
River	15
Spring not used as a source of *potable* water	15
Stream	15
Property Line	3

(3) Except as provided in Sentences 8.2.1.4.(1) and (2), a *holding tank* shall not be located closer than the minimum horizontal distances set out in Table 8.2.1.6.C.

3. Applicant's Position

The Applicant submitted in his application, referenced in Exhibit 1, that he would like the Building Code Commission to consider an alternative solution to achieve sufficiency of compliance with the Building Code's requirements. Included in the application submitted to the Commission, was a proposal to increase the leaching bed area, as illustrated in a previous application and approval to the Ministry of Environment, Certificate of Approval #FOLY-43-86. The Certificate of Approval from the Ministry explained what requirements would need to be met in order to install the Class 4 sewage system on the island. These requirements included: transporting sand fill to the island to create a level mantle that would stretch across the entire island north to south and extending at least 15.24 meters from the easterly end of the property. Further, the mantle would have to be .30 m to .60 m thick, and on top of the mantle, a filter system would be constructed having a dimension of 2.13 m wide by 7.92 m long from east to west.

The Applicant stated that he proposed to install an imported mantle and use the existing excavated soils to create a lined channel that would direct the effluent to the mantle area. He also proposed to pump out the treatment unit once a year by means of a contract. He suggested that this, in his opinion, would minimize the risk of malfunction of the sewage system and would limit the probability that the public would be exposed to an unacceptable risk of illness due to unsanitary conditions caused by exposure to human or domestic waste.

In addition, the Applicant also offered to add a tertiary treatment unit and to import clay soil as compensating measures in order to provide sufficiency of compliance with the Code requirements. The Applicant, upon being questioned, also confirmed that a 12 m clearance distance to the lake could be maintained on the property in three directions.

In summary, the Applicant stated that his main objective was to protect the environment, while providing a safe and efficient sewage system for his client and asked the Commission to consider the above alternatives and compensating measures for the proposed installation of the Class 4 sewage system.

4. Respondent's Position

The Respondent submitted that the Applicant's proposal to install the Class 4 sewage system does not meet the minimum clearance distance requirements from the leaching bed to the lake as required by Sentences 8.2.1.6.(1) and 8.2.1.6.(2), Tables 8.2.1.6.A. and 8.2.1.6.B. for a Class 4 sewage system.

The Respondent maintained that the Code requires a minimum clearance distance from the leaching bed to the lake was 15 m and that the Applicant's proposed design fell short by 3 m and with the fluctuating water levels and the island width, the minimum clearance of 15 m wouldn't be achieved. In addition, the Respondent's written submission to the Commission claimed that the applicant had not provided any acceptable alternative solutions.

In summary, the Respondent's advised that his main concern was that the minimum setback as required by Sentences 8.2.1.6.(1) and 8.2.1.6.(2), Tables 8.2.1.6.A. and 8.2.1.6.B. for a Class 4 sewage system could not be met.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposed construction of a Class 4 sewage system providing a clearance distance of 12 m from the leaching bed to the lake provides sufficiency of compliance with Division B, Sentences 8.2.1.6.(1), 8.2.1.6.(2), Tables 8.2.1.6.A. and 8.2.1.6.B. of the Building Code at 811-117 Water Access on McMichael Island in Salmon Lake Lot 27, Concession 3, Seguin Township, Ontario, on condition that:

a) The leaching bed system as identified in the application to the Building Code Commission dated August 20, 2007 and on the owner's copy of the Certificate of Approval, # FOLY-43-66, issued by the Ministry of the Environment, August 13, 1996 be used in conjunction with a tertiary treatment system as proposed by the Applicant.

b) A minimum mantle length of 12 m shall be maintained in three directions from the filter bed. Specifically, the mantle shall provide a minimum12 m clearance from the filter bed to the lake in the north, east and south directions, as shown in the application to the Building Code Commission and as referenced above.

6. Reasons

i) In the opinion of the Commission, the combination of the tertiary treatment unit, as proposed by the Applicant, and the raised leaching bed, will allow for the enhanced treatment of effluent and will sufficiently comply with the intent of the Code.

ii) The nature of the underlying soil and design of the mantle, which will maintain a minimum clearance distance of 12 m from the leaching bed to the lake in the north, east and south directions, combined with the use of a tertiary treatment unit, provides sufficiency of compliance with Division B, Sentences 8.2.1.6.(1), 8.2.1.6.(2) and meets the intent of the Building Code.

Ruling No. 09-22-1234
Application No. 2009-27

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 9.8.8.6. of Regulation 350/06, as amended, (the Building Code).

AND IN THE MATTER OF an application by Douglas Ghent, for the resolution of a dispute with Doug Robertson, Chief Building Official, Township of Wilmot, to determine whether the as-installed guard, serving the flight of steps from the main floor to the lower level of a residential dwelling provides sufficiency of compliance with Article 9.8.8.6. of Division B of the Building Code at 2312 Snyder's Road East, RR # 2, Petersburg, Ontario.

APPLICANT	Douglas Ghent Homeowner Petersberg, ON
RESPONDENT	Doug Robertson Chief Building Official Township of Wilmot
PANEL	Prabhakar Mahant, Chair-Designate Mina Tesseris Doug Clancey
PLACE	Toronto, Ontario
DATE OF HEARING	October 22, 2009
DATE OF RULING	October 22, 2009
APPEARANCES	Douglas Ghent Homeowner Petersberg, ON **The Applicant** Doug Robertson Chief Building Official Township of Wilmot **The Respondent**

RULING

1. Particulars of Dispute

The subject building is a one storey, single dwelling unit. The construction in dispute involves the construction of a new flight of steps between the basement and the first storey of the subject building. At dispute is whether the as constructed guard complies with Article 9.8.8.6. of Division B of the Building Code.

The subject guard in dispute is comprised of metal spindles with decorative projections located on every other spindle. The guard has been installed with an alternating pattern where the first spindle has one decorative metal projection located at a height of 444.5 mm above the floor surface, the second spindle has no projections and the third spindle has two metal projections, one located at a height of 228.5 mm and the second located at a height of 648 mm above the floor surface.

Article 9.8.8.6. requires guards to be designed so that no member, attachment or opening will facilitate climbing. The Appendix note to Article 9.8.8.6. of the Code prohibits guards that are constructed with horizontal or near-horizontal members between balusters such that a ladder effect is achieved.

The issue at dispute is whether the as-installed guard sufficiently complies with Article 9.8.8.6. of the Code.

2. Provisions of the Building Code in Dispute

9.8.8.6. Design to Prevent Climbing

(1) *Guards* required by Article 9.8.8.1., except those in *industrial occupancies* and where it can be shown that the location and size of openings do not represent a hazard, shall be designed so that no member, attachment or opening will facilitate climbing.

(2) *Guards* shall be deemed to comply with Sentence (1) where any elements protruding from the vertical and located within the area between 140 mm and 900 mm above the floor or walking surface protected by the *guard*,

(a) are located more than 450 mm horizontally and vertically from each other,

(b) provide not more than 15 mm horizontal offset,

(c) do not provide a toe-space more than 45 mm horizontally and 20 mm vertically, or

(d) present more than a 1-in-2 slope on the offset

3. Applicant's Position

The Applicant submitted that he believed the design of the as-installed guards sufficiently complied with Sentence 9.8.8.6.(1) of the Code in that they were designed so that they were not easy to climb. The Applicant described the guards using accompanying photographs. He explained that the decorative attachment, at its widest point, protrudes 25.4 mm horizontally from either side of the spindle. As a result, the Applicant argued that the decorative attachments on the guards are not large enough for a child to gain a foothold and therefore, do not make the guards easy to climb. Further, the Applicant argued that when the size of the attachments and location of the attachments are taken into consideration, a ladder effect is not created.

The Applicant also argued that he sufficiently complied with Sentence 9.8.8.6.(2) of the Building Code. He explained that there was a dispute with the Chief Building Official as to whether all the conditions as outlined in Clauses a), b), c) and d) of Sentence 9.8.8.6.(2) were required to be met in order to comply with this Sentence of the Code. The Applicant stated that it was his position that as long as the design of the guards met one of the conditions outlined in Clause a), b), c) or d) of Sentence 9.8.8.6.(2), the guards should be deemed to comply with the Building Code. In his case, the Applicant argued, the guards met condition (d) because the decorative attachments on the spindles present more than a 1-in-2 slope on the offset and therefore by complying with this condition, the guards comply with the Code. In support of his position, the applicant submitted a copy of the National Research Council of Canada's interpretation of the 2005 National Building Code provision 9.8.8.6., in which they interpreted the "or" between Clauses (c) and (d) of Sentence 9.8.8.6.(2) to be read between all four clauses of the Sentence.

In summary, the Applicant reiterated that it is his belief the as-installed guards do not facilitate climbing and therefore, comply with the Code.

4. Respondent's Position

The Respondent submitted that in his opinion, the subject guards are climbable and do not comply Article 9.8.8.6. He argued that Sentence 9.8.8.6.(1) of this article indicates all guards must be designed so that no member or attachment or opening will facilitate climbing. He further stated, it was his opinion the guards do facilitate climbing as they do not meet all the requirements outlined in Sentence 9.8.8.6.(2). As all the clauses in Sentence 2 are separated by an "or" instead of an "and", the Respondent stated it was his belief that all the clauses outlined in Sentence (2) must be complied with in order to accomplish Sentence (1). The Respondent argued that conformance with only one of the Clauses in Sentence (2), would result in the design of guards that are easily climbable and further, would contradict Sentence (1).

The Respondent submitted that the projections on the spindles located as they are, could in fact create a ladder effect if a child were to step on the 228.5 mm projection first, then climb to the 444.5 mm projection and finally, step up to the projection at 648 mm. He described the projections to be nearly flat and therefore, could easily create a toe hold for climbing. The Respondent further submitted that the Municipality disagreed with National Research Council's interpretation of the 9.8.8.6. of the 2005 National Building Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the as-installed guard, serving the flight of steps from the main floor to the lower level of a residential dwelling provides sufficiency of compliance with Article 9.8.8.6. of the 2006 Building Code at 2312 Snyder's Road East, RR # 2, Petersburg, Ontario.

6. Reasons

i) Sentence 9.8.8.6.(1) of Division B of the Building Code states, "Guards required by Article 9.8.8.1., except those in industrial occupancies and where it can be shown that the location and size of openings do not represent a hazard, shall be designed so that no member, attachment or opening will facilitate climbing."
It is the Commission's opinion that the as-installed guard does not facilitate climbing and therefore, provides sufficiency of compliance with Article 9.8.8.6. of the Code.

ii) The Commission is in agreement with the National Research Council of Canada's interpretation of the National Building Code 2005 provision 9.8.8.6., in which they interpret the "or" between Clauses (c) and (d) of Sentence 9.8.8.6.(2) to be read between all four clauses in this Sentence.

iii) Sentence 9.8.8.6.(2) of Division B of the Building Code states, "Guards shall be deemed to comply with Sentence (1) where any elements protruding from the vertical and located within the area between 140 mm and 900 mm above the floor or walking surface protected by the guard,

(a) are located more than 450 mm horizontally and vertically from each other,

(b) provide not more than 15 mm horizontal offset,

(c) do not provide a toe-space more than 45 mm horizontally and 20 mm vertically, or

(d) present more than a 1-in-2 slope on the offset.

The as-installed guard meets the requirements set out in Clauses 9.8.8.6.(2)(b) and (d). Therefore, since at least one of the requirements set out in Sentence 9.8.8.6.(2) is met, the guard provides sufficiency of compliance with Article 9.8.8.6.

PLACE	Toronto, Ontario
DATE OF HEARING	September 17, 2009
DATE OF RULING	September 17, 2009
APPEARANCES	Cyril Tahtadjian Cyncorp Developments Inc., Mississauga, ON **The Applicant** Frank Spagnolo Manager Plan Examination Serivces City of Mississauga **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for a permit under the *Building Code Act*, *1992*, to construct a professional office building at 100 Queen Street South, City of Mississauga, Ontario.
.

The subject building is a two storey, Group D occupancy building with a building area of 360 m². The building is of non-combustible construction and is equipped with a fire alarm and sprinkler system.

The construction in dispute involves the alternative solution proposed by the Applicant to protect two glazed openings, one on each storey of the south building face of the subject building, which backs onto a public park. The Code provides options for calculating the maximum aggregate area of unprotected openings in an exposing building face. In this case, the maximum percentage of unprotected openings permitted by the Code has been exceeded. As a result, the Applicant is proposing an alternative solution which involves protecting the glazed openings using a sprinkler protected window system. Article 3.1.18.18. of the Code permits the use of sprinkler protected glazed wall assemblies provided the wall assembly is constructed in accordance with the requirements of the ULC/ORD C263.1 “Sprinkler-Protected Window Systems”. The sprinkler protected window system being proposed will use combustible framing comprised of fiberglass and resin. However, the manufacturer’s requirements for the proposed window sprinkler specify that the window frames be made of non-combustible material. Therefore, the issue at dispute is whether the alternative solution offered complies with the Code.

2. Provisions of the Building Code in Dispute

3.1.8.18. Sprinkler Protected Glazed Wall Assembly

(1) A sprinkler protected glazed wall assembly shall be constructed in accordance with the requirements of ULC/ORD C263.1, “Sprinkler-Protected Windows Systems”.

(2) A sprinkler protected glazed wall assembly shall not be installed in,

(a) fire separations requiring a fire resistance rating of more than 2 hours,

(b) a firewall,

(c) a high hazard industrial occupancy, or

(d) any part of an exit serving,

(i) a floor area subject to the requirements of Subsection 3.2.6.,

(ii) a care and detention occupancy, or

(iii) a residential occupancy.

(3) Where a sprinkler protected glazed wall assembly is installed in an exit fire separation permitted in Sentence (2),

(a) the building shall be sprinklered, and

(b) the exits protected with the sprinkler protected glazed wall assemblies shall not comprise more than one half of the required number of exits from any floor *area*.

3. Applicant's Position

The Applicant submitted that he intended to build a commercial building containing professional offices that would aesthetically conform to the historical appearance of the streetscape. He explained that the building was situated on a corner which faced two municipal streets and that the south building face was adjacent to a municipally owned park. He advised it would likely always be maintained as a park and that there was no expectation of buildings being constructed in the park in future.

The Applicant went on to describe that the south building face was located approximately 1.5 to 1.7 m to the property line (limiting distance) and that one window on each floor of the south building face was beyond the maximum area for unprotected openings permitted by the Building Code. As a result, an alternative solution to protect the glazed openings using a sprinkler protected window system was offered. However, the sprinkler protected window system being proposed would use combustible framing comprised of fiberglass and resin, although the manufacture's requirements for the proposed window sprinkler would require the window frames to be made of non-combustible material.

The Applicant explained that due to the visual exposure of the south building face from the dedicated park and the importance of the heritage nature of the neighbourhood, fibreglass window frames were proposed, instead of fire rated steel frames. Steel frames, the Applicant reasoned, besides being inconsistent with the streetscape's aesthetic appeal, would also be thermally inefficient.

In support of his arguments, the Applicant submitted a third party Professional Engineer's stamped letter, which supported the alternative solution regarding the installation of the fibreglass frames for the subject sprinklered window systems. The professional opinion of the engineer was that the alternative solution would provide the required exposure protection of the south building face and further that sufficiency of compliance with the Building Code requirements would be achieved.

Further the Applicant contended that Sentence 3.1.5.4.(5) of the Building Code permits combustible window frames and sashes to be used in a building required to be of non-combustible construction, provided certain conditions are met. The Applicant also added that not only would the two subject windows be sprinklered but that in fact, the entire building, which was of non-combustible construction, would also be sprinklered even though it was not required by the Code.

In response to questions the Applicant conceded that one of the reasons for sprinklering the entire building was so that the maximum aggregate area of unprotected openings could be increased as permitted by the Building Code.

In summary, the Applicant stated that he believes the proposal to protect the glazed openings using a sprinkler protected wall assembly provides sufficiency of compliance with the Code.

4. Respondent's Position

The Respondent submitted that the approved plans indicated metal frames would be used for the two sprinklered window systems being proposed on the south building face. After the permit was issued, the Respondent stated that the Applicant submitted an alternative solution to replace the metal frames with combustible frames comprised of fibreglass and resin.

The Respondent argued that the third party professional engineer's proposal to use TYCO Model WS-K-5-6 window sprinklers to protect the unprotected openings on the south exterior wall of the subject building requires non-combustible window frames and further, that the use of combustible frames for the windows is not in compliance with the manufacturer's design criteria or ULC/ORD-C263.1, "Sprinkler-Protected Windows Systems" requirements.

The Respondent advised that the design criteria for the subject sprinklers requires a non-combustible frame with a standard EPDM rubber gasket seal and that the proposed use of fibreglass and resin frames deviate from ULC/ORD-C263.1. As a result, the Respondent argued, if the window frame is changed to a combustible material, it is considered a non-listed assembly and therefore, would contravene the manufacture's design criteria and further, would no longer comply with the ULC standard referenced by Article 3.1.8.18. of the Building Code.

In response to questions, the Respondent advised the Commission that there were three fire compartments in the building: the first floor, the second floor, and the garage. The Respondent also advised that the windows located on the second floor exceeded the maximum area permitted by the Code for unprotected openings by 0.8% and 0.6% on the first floor.

5. Commission Ruling

It is the Decision of the Building Code Commission that the alternative solution, where glazed openings, provided with combustible frames that are proposed to be protected by window sprinklers, does not provide sufficiency of compliance with Article 3.1.8.18. of Division B of the Building Code at Streetsville Professional Building, 100 Queen Street South, City of Mississauga, Ontario.

6. Reasons

i) Sentence 3.1.8.18 states, "A sprinkler protected glazed wall assembly shall be constructed in accordance with the requirements of ULC/ORD C263.1, "Sprinkler-Protected Windows Systems". The subject Building Code ~~A~~article in dispute refers to compliance with a standard. It is not within the Building Code Commission's mandate to interpret or modify the requirements of a test standard referenced by the Building Code.

ii) ULC/ORD C263.1, "Sprinkler-Protected Windows Systems" provides guidelines on the installation of a sprinkler protected window system. Appendix A4.7 of the Standard states, "Glazing and frames must be installed in accordance with the sprinkler Manufacturer's Listing, glazing and framing Manufacturer's installation instructions and good engineering/architectural practice". The manufacturer's installation instruction for the proposed sprinkler model requires that the framing supporting the glazing be of noncombustible material. The proposed framing is of combustible material comprised of fiberglass and resin.

iii) It is the Commission's opinion, that the applicant's alternative solution lacked sufficient test data and evidence to support the argument that the proposed sprinkler protected window system with combustible frames will perform equivalently to a sprinkler protected window system with noncombustible framing as prescribed by the sprinkler manufacturer's installation instructions.

DATE OF HEARING	June 18, 2009
DATE OF RULING	June 18, 2009
APPEARANCES	Leszek Muniak Larden Muniak Consultant Toronto, ON **Agent for the Applicant** Ted Marecak Chief Building Official City of Belleville

The Respondent

RULING

1. Particulars of Dispute

The Applicant has received a permit under the *Building Code Act*, *1992*, and is currently constructing a 6 storey addition at Quinte Health Care-Belleville General, 265 Dundas Street East, Belleville, Ontario.

The subject building is a Group B, Division 2, Care and Treatment major occupancy. The existing building was constructed in 1947 with additions added in 1969 and 1971. The building is 7 storeys in building height with a roof top mechanical penthouse and is considered to be a high building, which is required to comply with the Building Code requirements of Subsection 3.2.6. Currently, a new 6 storey addition on the east side of the existing hospital is being constructed. The new addition has a building area of approximately 3, 077 m². Including the latest addition, the building will have a total building area of approximately 27 500 m². The new addition contains patient rooms, clinics, treatment areas, ICU, support services, offices and a loading dock.

The construction in dispute involves the two main exit stair shafts, which serve the new 6 storey addition. Each exit stair shaft contains a translucent panel, which is exposed to the unprotected openings of adjacent fire compartments on levels 2, 3, 4 and 5 of the addition. Specifically, the patient sleeping rooms have unprotected openings within 3 m of the unprotected openings in the exit stair enclosures.

Article 3.2.3.12. of the Building Code requires that where the plane of an exterior wall of an exit enclosure forms an angle less than 135° with the plane of an exterior wall of the building it serves, and the exit enclosure and the exterior wall have openings that are not protected and are within 3 m apart horizontally and the exterior wall opening is less than 10 m below or less than 2 m above the exit enclosure opening, one of the openings is required to be protected by either glass block, wired glass or a closure.

In lieu of protecting one of the openings with either glass block, wired glass or a closure, the Applicant is proposing a “compliance equivalency” which is to increase the design density of the required sprinkler system serving the fire compartments from a light hazard sprinkler system to an ordinary hazard (Group 1) sprinkler system. It is the Applicant’s position the proposal to increase the design flow density of the required sprinkler system will enable the sprinkler system to extinguish a fire rather than control it, thus eliminating any radiation created by a fire originating from the fire compartment and maintaining the integrity of the exit enclosures.

It is the Respondent’s position that sprinklers are not one of the permissible means of protecting openings, which are not protected in fire compartments and that are adjacent to, and within specified distances of openings that are not protected in exit enclosures. Further, it is the Respondent’s position that the proposal is not substantiated by documented evidence to support the claim that increasing the design density of sprinkler flow would result in a timely extinguishment of a fire and therefore, maintain the integrity of the exit enclosure.

2. Provisions of the Building Code in Dispute

3.2.3.13. Protection of Exit Facilities

(1) Except as required by Sentence (3) and as permitted by Sentence 3.4.4.3.(1), if the plane of an exterior wall of an *exit* enclosure forms an angle less than 135° with the plane of an exterior wall of the *building* it serves, and an opening in the exterior wall of the *exit* enclosure could be exposed to fire from an opening in the exterior wall of the *building*, the opening in either the exterior wall of the *exit* or the exterior wall of the *building* shall be protected in conformance with the requirements of Sentence (4) where the opening in the exterior wall of the *building* is within 3 m (9 ft 10 in) horizontally and,

(a) less than 10 m (32 ft 10 in) below an opening in the exterior wall of the *exit*, or

(b) less than 2 m (6ft 7in) above an opening in the exterior wall of the *exit*

(2) If an unenclosed exterior *exit* stair or ramp could be exposed to fire from an opening in the exterior wall of the *building* it serves, the opening in the exterior wall of the *building* shall be protected in conformance with the requirements of Sentence (4) where the opening in the exterior wall of the *building* is within 3 m horizontally and,

(a) less than 10 m below the *exit* stair or ramp, or

(b) less than 5 m above the *exit* stair or ramp.

(3) Except as permitted by Sentence 3.4.4.3.(1), if an exterior *exit* door in one *fire compartment* is within 3 m horizontally of an opening in another *fire compartment* and the exterior walls of these *fire compartments* intersect at an exterior angle of less than 135°, the opening shall be protected in conformance with the requirements of Sentence (4).

(4) The opening protection referred to in Sentences (1) to (3) shall consist of,

(a) glass block conforming to the requirements of Article 3.1.8.14.,

(b) a wired glass assembly conforming to Supplementary Standard SB-2, or

(c) a *closure* conforming to the requirements of Subsection 3.1.8. and Articles 3.2.3.1. and 3.2.3.14.

3. Applicant's Position

The Agent maintained that the proposed compensating measure to increase the design density of the sprinkler system serving the fire compartments containing unprotected openings which are adjacent to unprotected openings within an exit stair enclosure, from a light hazard occupancy sprinkler system to an ordinary hazard (Group 1) sprinkler system, would provide sufficiency of compliance and meet the intent of the Building Code.

The Agent submitted that a light hazard sprinkler system is designed to "control" the spread of fire, where as the increased sprinkler density of an ordinary hazard group 1 sprinkler system is designed to "extinguish" a fire. As a result, the Agent claimed that the amount of the water released by the ordinary hazard group 1 sprinkler system will extinguish the fire, thereby, eliminating radiation and maintaining the integrity of the exit enclosures.

The Agent concluded that the installation of an ordinary hazard group 1 sprinkler system within the fire compartments that have unprotected openings within 3m of the unprotected openings in the exit enclosure provides the level of life safety required by the Code. He stated that an ordinary group 1 system will extinguish the fire and eliminate radiation before it compromises the exit enclosure, which in turn, achieves sufficiency of compliance with the Building Code.

4. Respondent's Position

The Respondent submitted that the Applicant's proposal to increase the sprinkler density within the fire compartments that contain unprotected openings, to compensate for the exposure to the adjacent unprotected opening in the exit stair shaft, is not one of the permitted options identified in Sentence 3.2.3.12.(4) of the Code to protect the subject exit stair enclosures.

The Respondent asserted that there has been no documented evidence to support the claim that an increase in the sprinkler density from a light hazard occupancy sprinkler system to an ordinary hazard (Group 1) sprinkler system within the fire compartments that are adjacent to the unprotected opening in the exit stair enclosure, will be sufficient to maintain the integrity of the exit stair enclosure.

The Respondent maintained that Building Code affords exit enclosures extra protection as they serve a vital role in occupant safety and that this is even more critical in a care and treatment occupancy such as the subject building, where evacuation in the case of an emergency will take and extended amount of time. The Respondent argued that to rely on an unproven theory that an increase in sprinkler density would achieve the same level of protection as compliance with the Code is unreasonable.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposal to increase the sprinkler density within fire compartments that contain unprotected openings, which are exposed to the unprotected openings of adjacent exit stair enclosures located on floors 2, 3, 4 and 5 of an existing seven storey, Group B, Division 2 major occupancy building, does not provide sufficiency of compliance with Article 3.2.3.12. of the 1997 Building Code at Quinte Health Care-Belleville General, 265 Dundas Street East, Belleville, Ontario.

6. Reasons

i) Article 3.2.3.12. of the 1997 Building Code requires that where the plane of an exterior wall of an exit enclosure forms an angle less than 135° with the plane of an exterior wall of the building it serves, and the exit enclosure and the exterior wall have openings that are not protected and within 3 m apart horizontally, and the exterior wall opening is less than 10 m below or less than 2 m above the exit enclosure opening, one of the openings is required to be protected by glass block, wired glass or a closure.

   Based on the evidence and testimony, the Commission was not convinced that the proposal to increase the design density of the sprinklers from "light hazard" to "ordinary hazard" as defined in NFPA 13, would provide the equivalent performance level that would be achieved by conformance with the requirements of Article 3.2.3.12. of the Building Code and thereby, maintain the integrity of the exit enclosures.

ii) Based on the evidence and testimony of the parties, it is the Commission's opinion that there is no construction barriers that would impede the implementation of one of the options listed in Sentence 3.2.3.12.(4) of the Building Code.

iii) As the subject building is a hospital, there is an additional level of safety concern for the occupants exiting the building,

DATE OF HEARING	June 4, 2009
DATE OF RULING	June 4, 2009
APPEARANCES	Jon Winton Leber / Rubes Inc. Toronto, ON **Agent for the Applicant** Brett Forestell Deputy Chief Building Official City of Belleville, ON **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for a permit under the *Building Code Act*, *1992*, to construct an addition to an existing vehicle dealership at West City Honda, 670 Dundas Street West, R.R.2, Belleville, Ontario.

The existing building is a 1267 m², single storey, and is comprised of a service area, offices and a car showroom. The one storey addition is intended to extend the building horizontally by 733 m² in building area. The building addition will contain a service area, sales office, accessory display area, and a vehicle showroom for such items as all terrain vehicles, motorcycles and small engine equipment. The accessory and display area is expected to occupy approximately 674m² of the total floor area.

The building is comprised of noncombustible construction and is not equipped with a sprinkler system, standpipe system or a fire alarm system but is equipped with a monitored security system incorporating fire detection devices.

The dispute centers on the major occupancy classification of the addition. Both the Applicant and the Respondent agree that the proposed addition will contain more than one major occupancy and further, agree that the proposed addition will contain Group F, Division 2 and Group D occupancies. However, the Applicant's position is that the accessory display area and showroom should be classified as a Group F, Division 2 major occupancy, while it is the Respondent's position that the subject area should be classified as a Group E major occupancy.

2. Provisions of the Building Code in Dispute

3.1.2.1. Classification of Buildings

(1) Except as permitted by Articles 3.1.2.3. to 3.1.2.6., every *building* or part of it shall be classified according to its *major occupancy* as belonging to one of the Groups or Divisions described in Table 3.1.2.1.

(2) A *building* intended for use by more than one *major occupancy* shall be classified according to all *major occupancies* for which it is used or intended to be used.

3.2.2.6. Multiple Major Occupancies

(1) Except as permitted by Articles 3.2.2.7. and 3.2.2.8., in a *building* containing more than one *major occupancy*, the requirements of this Subsection for the most restricted *major occupancy* contained shall apply to the whole *building*.

3. Applicant's Position

It is the Applicant's position that the building contains a combination of Group D and Group F, Division 2 major occupancies and that the Group D portion of the building includes the sales/administrative office portions of the building and that the Group F, Division 2 portion of the building includes the vehicle showroom, accessories display area and vehicle service shops.

The Agent for the Applicant stated that the principal concern to the Applicant, with respect to classifying the showroom and accessory display spaces as a Group F, Division 2 major occupancy or E major occupancy, is that a Group F Division 2 classification would not require the building to be sprinklered as a result of its increased building area.

The Agent submitted that the vehicle showroom and accessory display area is not a mercantile,

Group E major occupancy, as mercantile occupancies contain substantial quantities of retail goods, displayed in high density arrangements with moderately high occupant loads. On the contrary, motor vehicle showrooms do not have the same high fire loads or high occupant load characteristics as mercantile occupancies and therefore, do not require same levels of fire protection.

The Agent submitted that based on Sentence 3.1.17.1.(1) of the Building Code using 3.7 m^2/person as per Table 3.1.17.1., the occupant load of the building showroom and accessory display area would be 182 persons for a mercantile occupancy. The Agent claimed that although the Building Code does not provide an occupant load factor for automobile showrooms 182 person occupant load is excessive for the intended use and that an occupant load of 72 persons for a showroom is more realistic based on the office occupant load factor of 9.3 m^2/person, as purchases require the assistance of a sales person and sales offices are provided for a limited quantity of staff.

The Agent argued that a Group F, Division 2 occupancy for the showroom and display areas is a reasonable classification as contents are displayed in a manner that is not representative of the high combustible loads of a retail or department store. The showroom will contain samples of vehicles, power equipment and accessories that are available for purchase with accessory displays are expected to carry a limited quantity of apparel, for example: jackets, shirts, helmets, and gloves.

The Agent submitted that the sample vehicles and equipment displayed are in new condition, stationary, contain no fuel, have disconnected batteries to reduce spark ignition potential and are not operated within the showroom. As a result, the risk of fire in the vehicle showroom is considered to be less that of a storage garage (F-3 occupancy) or a repair garage (F-2 occupancy), where vehicles are under individual control, in operation, contain fuel, may be in poor condition or may be undergoing service.

The Agent argued that as per Appendix note A-3.1.2.1.(1) of the 2005 National Building Code of Canada includes “salesrooms” as both Group F, Division 2 and 3 major occupancies rather than Group E mercantile and therefore, an automobile dealer’s showroom is consistent with this use.

The Agent further argued that the Ontario Office of Fire Marshal’s standard fire incident reporting system used to collect fire incident data utilizes the alphabetical occupancy classification system of the Ontario Building Code and specifically, identifies “motor vehicle sales” and “motor vehicle parts, accessory sales” as Group F industrial occupancies rather than Group E mercantile occupancy.

In summary, the Agent stated that it was the Applicant’s position that neither the building addition nor the existing building are required to be sprinklered because the showroom and display areas are classified as a Group F, Division 2 major occupancy.

4. Respondent’s Position

The Designate for the Respondent submitted that Article 3.1.2.1. of the Ontario Building Code states, “a *building* intended for use by more than one *major occupancy* shall be classified according to all *major occupancies* for which it is used or intended to be used”. He stated that the proposed addition to the building is to be used by Honda Power Products for the sales and servicing of products such as: motorcycles, all terrain vehicles, marine, lawn and garden power equipment, generators, water pumps and snow blowers. The Designate described the existing building’s uses are motor vehicle sales, parts and apparel sales and motor vehicle repair garage.

He therefore, claimed that the subject building would contain Group F, Division 2, Group D and Group E, major occupancies.

The Designate explained that when determining the classification of the building according to Sentence 3.1.2.1.(1) of Division B of the Building Code, the corresponding Appendix note was also referenced and reviewed. The Appendix advised that “to ensure correct classification, refer to the definitions for each occupancy in Part 1, of Division A”.

The Designate stated that when reviewing the occupancy definitions for Group D, Group E, and Group F2 in the Building Code, it was evident that the extended building would contain all of the above occupancies, including Group E, mercantile occupancy. The Designate referring to Division A of the Building Code, stated that mercantile occupancy is defined as “the occupancy or use of a building or part of a building for the displaying or selling of retail goods, wares or merchandise”, and as such, the use of the accessories display area and the small engine showroom are considered a Group E, mercantile occupancy.

Further, the Designate argued that as per Sentence 3.2.2.6.(1) of Division B of the Building Code which states, “Except as permitted by Articles 3.2.2.7. and 3.2.2.8., in a *building* containing more than one *major occupancy*, the requirements of this Subsection for the most restricted *major occupancy* contained shall apply to the whole *building*” that when determining the building size and construction relative to occupancy, the Group E building classification is the most restricted major occupancy and would therefore, require the building to be sprinklered.

The Designate also pointed out that although the 2005 National Building Code of Canada included the term “salesroom” as both a Group F, Division 2 and 3 major occupancy the Ontario Building Code listed “salesroom” as a group F, Division 2 or 3 major occupancy until 1997, when it was removed from the list. The Designated concluded that the removal of this term from the Group F, Division 2 or 3 occupancy category was intentional for the purpose of more accurately reflecting the many possible combination of uses that could be applicable to a “salesroom” occupancy.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposal to classify the accessories display area and the all terrain vehicle, motorcycle and small engine equipment showroom, which will form part of a new addition to the existing motor vehicle sales and service building, as a Group F, Division 2 major occupancy, does not provide sufficiency of compliance with Article 3.1.2.1 and 3.2.2.6. of the Building Code at West City Honda, 670 Dundas Street West, R.R.2, Belleville, Ontario.

6. Reasons

i) Article 3.1.2.1. of Division B of the Building Code states, “(1) every *building* or part of it shall be classified according to its *major occupancy* as belonging to one of the Groups or Divisions described in Table 3.1.2.1.” and “(2) A *building* intended for use by more than one *major occupancy* shall be classified according to all *major occupancies* for which it is used or intended to be used”.

   The Commission heard that the parties were in agreement that the proposed addition will contain more than one major occupancy and further, agreed that the proposed addition would contain Group F, Division 2 and Group D occupancies. However, the parties were not in agreement that the display area and showroom be classified as a Group E major occupancy.

Division A, Part 1 of the Building Code defines Mercantile occupancy as “the occupancy or use of a building or part of a building for the displaying or selling of retail goods, wares or merchandise”.

Based on the evidence, drawings and testimony of the parties and the definition of a “mercantile occupancy” as described in the Building Code, it is the Commission’s opinion that the proposed building addition will contain a Group E major occupancy where merchandise will be displayed and sold.

ii) Sentence 3.2.2.6.(1) of Division B of the Building Code states, “Except as permitted by Articles 3.2.2.7. and 3.2.2.8., in a *building* containing more than one *major occupancy*, the requirements of this Subsection for the most restricted *major occupancy* contained shall apply to the whole *building”.* In this case, the most restricted major occupancy contained in the building is the Group E major occupancy and therefore, the construction requirements for a Group E major occupancy apply to the building.

PANEL	Tony Chow, Chair
PLACE	Toronto, Ontario
DATE OF HEARING	May 19, 2009
DATE OF RULING	May 19, 2009
APPEARANCES	Sherrie McTaggart via teleconference Owner Atwood, Ontario **The Applicant** Ed Podniewicz via teleconference Chief Building Official Municipality of North Perth Listowel, Ontario **The Respondent**

RULING

1. Particulars of Dispute

The Applicant applied for a building permit under subsection 8(1) of the Act to renovate “one room” of an existing two storey, 934.4 m², commercial/residential building.

The dispute between the parties involves whether the Chief Building Official (the Respondent) complied with subsections 8(2.2) and 8(2.3) of the Act and Division C, Sentence 1.3.1.3.(1) of the Building Code. Specifically, whether the Chief Building Official issued or refused to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal, within the time period prescribed in Table 1.3.1.3. of Division C of the Building Code.

2. Provisions of the Act and Building Code in Dispute

Act: subsections 8(2.2) and (2.3)

Decision

(2.2) When an application for a permit contains the prescribed information, the chief building official is required to determine within the period prescribed by regulation whether to issue the permit or to refuse to issue it.

Same, reasons for refusal

(2.3) If the chief building official refuses to issue the permit, he or she shall inform the applicant of all of the reasons for the refusal of the permit and shall do so within the period prescribed by regulation.

Building Code: Sentences 1.3.1.3. (1) and (5)

Division C, Article 1.3.1.3. Period Within Which a Permit is Issued or Refused

(1) Subject to Sentences (2) and (3), if an application for a permit under subsection 8 (1) of the Act that meets the requirements of Sentence (5) is submitted to a *chief building official*, the *chief building official* shall, within the time period set out in Column 3 of Table 1.3.1.3. corresponding to the class of *building* described in Column 2 of Table 1.3.1.3. for which the application is made,

(a) issue the permit, or

(b) refuse to issue the permit and provide in writing all of the reasons for the refusal.

(5) The requirements for an application referred to in Sentence (1) for a permit under subsection 8 (1) of the Act are,

(a) that the application be made in the form described in Sentence 1.3.1.2.(2),

(b) that the application be signed by a person described in Clause 1.3.1.2.(1)(a) or (b),

(c) that all applicable fields on the application form and required schedules are completed,

(d) that all attachments indicated as being attached to the application are submitted with the application, and

(e) that the application be accompanied by the types and quantities of plans and specifications that are prescribed by the applicable by-law, resolution or regulation made under clause 7 (1) (b) of the Act.

Table 1.3.1.3.
Period Within Which Permit Shall be Issued or Refused

Forming Part of Article 1.3.1.3.

Column 1	Column 2	Column 3
Row Number	Class of *Building*	Time Period
1	(a) A detached house, semi-detached house, townhouse, or row house where no *dwelling unit* is located above another *dwelling unit*. (b) A detached structure that serves a *building* described in Clause (a) and does not exceed 50 m^2 in *building area*. (c) A tent to which Section 3.14. of Division B applies. (d) A sign to which Section 3.15. of Division B applies.	10 days
2	(a) *Buildings* described in Clause 1.1.2.4.(1)(a), (b) or (c) of Division A, other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* that do not exceed 600 m^2 in *building area*.	15 days
3	(a) *Buildings* described in Clause 1.1.2.2.(1)(a), or (b) of Division A, other than *buildings* described in Column 2 of any of Rows 1 and 4 of this Table. (b) *Farm buildings* exceeding 600 m^2 in *building area*.	20 days
4	(a) *Post-disaster buildings*. (b) *Buildings* to which Subsection 3.2.6. of Division B or any provision in Articles 3.2.8.3. to 3.2.8.11. of Division B applies.	30 days

3. Applicant's Position

The Applicant participated in the hearing by way of teleconference and advised the Commission that that a building permit application was submitted to the Municipality of North Perth on May 10, 2007. The Applicant stated that the application, including all appropriate documentation, was submitted to the municipality at that time.

The Applicant informed the Commission that the permit application proposed the renovation of one room with an area of 65 m², located on the second floor of a two storey commercial/residential building, and as such, there was a 15 day time frame for the Respondent to either refuse the permit application with reasons or to issue the permit.

The Applicant maintained that to date, she had not received a determination from the Respondent regarding her application for the building permit. The Applicant asserted that the time frame for the Respondent to respond to the permit application was 15 days and that the Respondent had neither issued the building permit nor refused to issue the building permit with reasons.

In response to questions, the Applicant explained that to date the permit fee had not been paid as a result of a long standing disagreement regarding the amount of the permit fee. The Applicant stated that the fee the Municipality was requesting was unreasonable, as it included charges for a Class 5 sewage system permit and a building permit based on 126.8 m². She explained that she disagreed with the permit fee charge being based on 126.8 m² because she was only planning to renovate one room with an area of 65 m² at this time and was not planning

to renovate the entire upper floor of her building. The Applicant also added that it was her understanding that within the year, her building would be connected to the Municipal sewer line; therefore, a permit to replace or upgrade her existing Class 5 sewage system, which was working perfectly well, was unnecessary. As a result, the Applicant informed the Commission that she had offered to pay the permit fee based on a calculation of 65 m² less the permit fee for the sewage system but that it was not accepted by the Municipality.

In response to questions, the Applicant and Respondent agreed to an amount for the permit fee.

4. Respondent's Position

The Respondent participated in the hearing by way of teleconference and submitted that the subject building permit application was made on May 10, 2007 but that the permit application was incomplete.

The Respondent explained that a building permit application was originally submitted by the Applicant on December 5, 2006 to perform a "commercial/residential" alteration/repair. He stated that he and the Property Standards Officer attended the subject building site along with the applicant, as the plan and supplementary documents submitted by the applicant with the permit application did not provide adequate information to issue a building permit.

The Respondent submitted that following this initial site inspection, a plan review summary was prepared and faxed to the Applicant on January 3, 2007, which outlined the items that would need to be addressed to enable the issuance of a building permit. Some of the outstanding items related to fire protection, occupant safety and the capacity of the existing sewage system. The Respondent maintained that the required time period being 15 days, as prescribed in Table 1.3.1.3. of the Building Code had never commenced, as the application was not deemed complete as per Subsections 8(2)(e) and (f) of the *Building Code Act* and further, permit fees had not been received. The Respondent explained that further disputes with Applicant ensued with respect to the requirements of the Building Code and as a result, the Applicant withdrew the permit application. The Respondent informed the Commission that the Municipality later discovered that renovations at the subject building had been undertaken without a building permit and as a result, a Stop Work Order and an Order to Comply were issued to the Applicant.

The Respondent explained that the issuance of these Orders prompted the Applicant to submit a new building permit application on May 10, 2007 to renovate one room at the subject building. The Respondent maintained that the plans and specifications that are prescribed by the applicable by-law, By Law No. 66-2005 did not accompany the submission of the new permit application. Consequently, on May 15, 2007, a letter detailing the information outstanding in order to process the permit application was faxed to the Applicant. The Respondent stated that as with the initial application the Applicant disputed the permit fees and the requirements that needed to be addressed in the Building Code to enable the issuance of the building permit. Therefore, in his opinion, the Respondent claimed that the time frame to issue or refuse to issue the permit as outlined in Article 1.3.1.3. of Division C of the Building Code did not commence.

In summary, the Respondent reiterated that it was the Municipality of North Perth's position that they had not failed to meet the prescribed time frame set out in Division C, Article 1.3.1.3. of the Building Code due to the fact that a complete application with fees had never been received and further, that every attempt had been made to resolve the dispute to enable the issuance of a Building Permit.

5. Commission Ruling

It is the Decision of the Building Code Commission that, when considering the provisions of Division C, Article 1.3.1.3. of the Building Code, the Respondent was not required to comply with the prescribed time period related to subsection 8(2.2), 8(2.3) of the *Building Code Act,* regarding 199 Main Street, Atwood, Ontario.

6. Reasons

i) Subsection 8(2.2) of the *Building Code Act* states that when an application for a permit contains the prescribed information, the chief building official is required to determine within the period prescribed by the Building Code whether to issue the permit or to refuse to issue it.

ii) Sentence 1.3.1.3.(6) of the Building Code specifies when the time periods set out in Table 1.3.1.3 for a chief building official to issue or refuse a permit commences. It states, "The time period described in Sentences (1) to (3) shall begin on the day following the later of

(a) the day on which an application meeting the requirements of Sentence (5) is submitted to the chief building official, and

(b) the day on which payment is made of all fees that are required, under a by-law, regulation or resolution made under Clause 7(1)(c) of the Act, to be paid when the application is made."

The parties agreed that a permit application was submitted to the Municipality of North Perth on May 10, 2007.

iii) Sentence 1.3.1.3.(5) of the Building Code states, **"**The requirements for an application referred to in Sentence (1) for a permit under subsection 8(1) of the Act are,

(a) that the application be made in the form described in Sentence 1.3.1.2.(2),

(b) that the application be signed by a person described in Clause 1.3.1.2.(1)(a) or (b),

(c) that all applicable fields on the application form and required schedules are completed,

(d) that all attachments indicated as being attached to the application are submitted with the application, and

(e) that the application be accompanied by the types and quantities of plans and specifications that are prescribed by the applicable by-law, resolution or regulation made under clause 7 (1) (b) of the Act.

Based on the evidence presented, the Commission finds that the permit application submitted on May 10, 2007 did not meet all the requirements prescribed in Division C, Sentence 1.3.1.3.(5) of the Building Code. Specifically, the Commission was not convinced the applicant met the requirements outlined in Clause 1.3.3.1.(5)(e).

iv) Further, the Commission was advised that as a result of a disagreement between the parties regarding the amount of the building permit application fee, to this date, the required fee has not been paid or accepted. However, during the course of the hearing, the parties agreed to the amount of the fee that is to be paid.

v) Therefore, the Commission finds that since the requirements of Clauses 1.3.1.3.(6)(a) and (b) of the Building Code have not been satisfied, the timeframe set out in Table 1.3.1.3. for the chief building official to determine whether to issue a permit or refuse to issue a permit, did not commence in this case.

Dated at Toronto this **19th** day in the month of May in the year **2009** for application number **P-2009-12.**

DATE OF HEARING	April 9, 2009
DATE OF RULING	April 9, 2009
APPEARANCES	Geoffrey Kendal Geoffrey Kendal Architects Toronto, ON **Agent for the Applicant**
	Sam Sarkhosh Building Inspector City of Toronto **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an Order to Comply under the *Building Code Act*, *1992*, to remedy certain alleged code deficiencies at 347 Sorauren Avenue, Suite 216, Toronto, Ontario.

The subject building was an existing industrial building, which was renovated and turned into a residential complex. The building is 2 storeys in building height with 22 dwelling units located on the second floor and 26 dwelling units on the first floor. The floor area of each floor is approximately 2500 m².

The dwelling unit which is the subject of this dispute has an area of 61 m². A mezzanine having a floor area of approximately 18 m² has been constructed within the dwelling unit without a building permit. The mezzanine is currently being used as a bedroom. A steel spiral staircase has been installed to serve the mezzanine; it is the only means of access to the mezzanine.

The construction in dispute involves the installation of the steel spiral staircase serving the mezzanine. In particular, the Respondent is of the opinion that the steel spiral staircase does not comply with Articles 3.3.1.15. and 9.8.4.4 of the Building Code.

The size of the subject building dictates that the stairs be designed in accordance with the provisions of Part 3 of the Building Code. Article 3.3.1.15. of the Building Code permits the use of curved and spiral stairs provided the specifications for the rise and run are met. Article 3.3.4.7 cross references Section 9.8 for the requirements for stairs, handrails and guards within a dwelling unit. Article 9.8.4.4. provides the dimensional requirements for angled treads. The subject steel staircase is a spiral staircase with angled treads that has been installed within a residential dwelling. The stairs are not considered a required exit stair. The Applicant is of the opinion that the spiral stairs do not pose a hazard and therefore, meet the intent of the Building Code.

2. Provisions of the Building Code in Dispute

3.3.1.15. Curved or Spiral Stairs

(1) A curved or spiral stair is permitted in a stairway not required as an *exit* provided the stair has,

(a) treads with,

(i) a minimum run not less than 150 mm, and

(ii) an average run not less than 200 mm, and

(b) risers in conformance with Sentence 3.4.6.7.(2).

9.8.4.4. Dimensions for Angled Treads

(1) Angled treads in required *exit* stairs shall comply with Article 3.4.6.8.

(2) Except as provided in Article 9.8.4.5., angled treads in other than required *exit* stairs shall have an average run of not less than 200 mm and a minimum run of 150 mm.

(3) The depth of an angled tread shall be not less than its run at any point and not more than its run plus 25 mm.

3. Applicant's Position

The Applicant explained that six years prior, the subject spiral staircase was chosen due to the limited living space available in the 61 m² loft style dwelling unit. In particular, the Applicant pointed out that a straight run of stairs would have reduced the usable living space in what he considered to be, an already small unit. Further, it was his belief that the spiral staircase was now a centerpiece in the unit and an architectural feature of the loft.

The Applicant submitted that the as-installed spiral staircase does not pose a life safety risk. He argued that the staircase has already been in place and in use for six years by him, his wife, five year old daughter, and visitors without issue or incident. The Applicant submitted that as the 18 m² mezzanine is very small, there are never more than two or three people on the mezzanine level at any one time. The mezzanine also has an open concept design so that any sign of smoke or fire could easily be detected. The Applicant also suggested that since the mezzanine is not very high from the first level, in the event of an emergency requiring escape or evacuation, a person could climb over the guard rail and jump down to the main level without injury. Alternatively, he argued, a person could use either of the two large windows accessible from the mezzanine which exit out onto a flat roof and therefore, could also be used as an area of refuge and escape.

The Applicant also added that the unit was also equipped with 10 sprinkler heads, a smoke detector and a carbon monoxide detector. The Applicant submitted photos and dimensional specifications of the steel spiral staircase in support of his position.

The Applicant conceded that the installed prefabricated steel spiral staircase does not strictly comply with the requirements of the Code; however, he is of the opinion that the staircase does not pose a hazard and therefore, complies with the intent of the Code.

4. Respondent's Position

The Respondent maintained that the Building Code is very clear on the issue in dispute. He submitted that Articles 3.3.1.15. and 9.8.4.4. are applicable to the subject stairs, and added that the minimum and average tread runs were not in compliance. In addition, he stated that Sentence 9.8.2.1.(2), of the Code requires that at least one stair between each floor level within a dwelling unit must have a minimum stair width of not less than 860 mm and that the subject stairs were in fact the only stairs serving the mezzanine and they did not meet the minimum specified stair width required by the Code. The Respondent also added that it was his position that the installed spiral staircase presented a tripping hazard and further, posed a life safety risk.

5. Commission Ruling # 09-05-1217, BCC Application # B-2009-03

It is the Decision of the Building Code Commission that the as-installed prefabricated steel spiral staircase serving a mezzanine of a residential dwelling does not provide sufficiency of compliance with Articles 3.3.1.15 and 9.8.4.4. of the 2006 Building Code at 347 Sorauren Avenue, Suite 216, Toronto, Ontario

6. Reasons

i) The Building Code permits the use of curved or spiral stairs provided the dimensional requirements outlined in the Code are met. The size of the subject

building dictates that it be designed to the provisions of Part 3 of the Building Code. Sentence 3.3.1.15.(1) of the Building Code stipulates that the stair treads are required to have a minimum run not less than 150 mm, an average run not less than 200 mm and a minimum rise of 125 mm and a maximum rise of 200 mm. The Commission was advised that the subject stair treads do not comply with this requirement as the minimum run of the stair treads are 102 mm.

ii) Article 3.3.4.7 cross references Section 9.8 for the requirements for stairs, handrails and guards within a dwelling unit. Similar to Sentence 3.3.1.15.(1), Article 9.8.4.4. also requires angled treads to have a minimum run of 150 mm and an average run of not less than 200 mm. As stated above, the minimum run requirement for angled treads within a dwelling unit have not been met.

iii) The Building Code is a set of minimum set of construction requirements for buildings with the primary purpose of promoting public safety. One of the objectives associated with Article 9.8.4.4. of the Code is to limit the probability that as a result of design or construction, a person will be exposed to an unacceptable risk of injury due to hazards caused by tripping. In this case, the Commission was not convinced that the stair treads did not present a tripping hazard as per objective statement 3.1 of the Building Code.

iv) In addition, the Commission notes that as per Sentence 9.8.2.1.(2), the Code requires that at least 1 stair between each floor level within a dwelling unit must have a minimum stair width of not less than 860 mm. The Commission was advised that the subject spiral staircase was the only stair serving the mezzanine and that the stair width was 762 mm. Therefore, the existing stair width is less than the minimum stair width required by the Code.

PLACE	Toronto, Ontario
DATE OF HEARING	March 19, 2009
DATE OF RULING	March 19, 2009
APPEARANCES	Fernando Fabiani, Fabiani Architect Ltd Burlington, ON **The Applicant** Cveta Prgin Building Engineer City of Oshawa **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has applied for a permit under the *Building Code Act*, *1992*, to construct a retirement home with both Group B, Division 3, and Group C occupancies at 1255 Bloor Street East, Oshawa, Ontario.

The proposed building is 4 storeys in building height, 1695 m² in building area, comprised of non-combustible construction, containing both Group B, Division 3 and Group C occupancies, and is equipped with a sprinkler system, fire alarm system, and a standpipe and hose system.

Sentence 3.3.1.9.(9) of the Building Code requires that at the point where a doorway referred to in Sentence (8) opens onto a public corridor or exterior passageway, it shall be possible to go in opposite directions to each of 2 separate exits.

Sentence 3.3.1.4.(1) of the Code states that a public corridor shall be separated from the remainder of the storey by a fire separation.

The construction in dispute involves the means of egress from the suites on the ground floor of the subject building. The Applicant proposes to provide two means of egress from the doorway of each suite, where one of the required means of egress will pass through a public corridor into a “corridor used by the public” which contains an occupancy that then leads to an exit. The subject “corridor used by the public” that is part of the path of travel for exiting, contains a common area for the residents which includes a dining area. One of the required exits from the ground floor suites will require residents to travel through the ground floor common area to an exit door. Therefore, the dispute before the Commission is to determine whether the proposed egress design sufficiently complies with the Code requirements for “means of egress” and “public corridor separations”.

2. Provisions of the Building Code in Dispute

3.3.1.3. Means of Egress

(9) Except as permitted by this Section and by Sentence 3.4.2.1.(2), at the point where a doorway referred to in Sentence (8) opens onto a *public corridor* or exterior passageway, it shall be possible to go in opposite directions to each of 2 separate *exits*.

3.3.1.4. Public Corridor Separations

(1) Except as otherwise required by this Part or as permitted by Sentence (4), a *public corridor* shall be separated from the remainder of the *storey* by a *fire separation*.

3. Applicant’s Position

The Applicant submitted that the proposed retirement home does not provide care for its occupants but provides supervision only. He explained that the building is comprised of both Group C and Group B, Division 3 occupancies and further, that only the 4th floor of the building would contain the Group B, Division 3 occupancy. The Applicant advised that the ground floor of the building contains a common dining area for the occupants. The dining area has been located on the ground level close to the front entrance of the building. The Applicant submitted that an

occupant exiting from a suite on the ground floor would be able to travel in opposite directions to each of two exits. The Applicant explained that one of the means of egress proposed would allow occupants to travel through a public corridor into a common area, in this case a ground floor dining area, to an exit door.

The Applicant argued that Sentence 3.3.1.3.(9) of the Code requires that upon exiting from a suite onto a public corridor, it shall be possible to go in opposite directions to each of two separate exits and that the subject design meets this requirement. He stressed that the Code does not say that both directions for exiting need to be by public corridor only. Further, the Applicant argued that Sentence 3.3.1.9.(5) of the Code states that a corridor used by the public is allowed to contain an occupancy.

The Applicant submitted that if the corridor width were to be considered to be very wide bound by gridlines 2 and 25, referring to the drawings submitted to the municipality and Commission, then the requisite fire separation requirements are met.

The Applicant advised that the corridors have been designed to meet the Code requirements for corridors including: maintaining the minimum unobstructed width, having smoke detectors, emergency lighting, meeting flame spread ratings, maximum travel distances, having no dead-end portions and no fuel fired appliances in the corridor.

4. Respondent's Position

The Respondent submitted that the ground floor residential suites is served by a public corridor that passes through a common area (dining hall) to an exit door and that there is no fire separation proposed between the public corridor and the common area.
The Respondent argued that Sentence 3.3.1.(9) of the Code requires that two separate exits are provided at each end of a public corridor and that in this case, the proposed public corridor leads to another occupancy; not to an exit.

Further, the Respondent argued that Sentence 3.3.1.4.(1) of the Code states that a public corridor is required to be fire separated from the remainder of the building, however, in the subject design the proposed 2400 mm wide public corridor is not fire separated from the common area.

The Respondent advised that the total floor area of the common area is approximately 400 m², which is more than 23% of the ground floor area and the occupant load of the common area is approximately 108 persons.

The Respondent maintained that in her opinion, the subject egress design from the ground floor suites did not achieve compliance with the Building Code.

5. Commission Ruling

It is the Decision of the Building Code Commission that the proposed egress system for the ground floor level of a four storey building containing Group B, Division 3 and Group C major occupancies, where one of the required means of egress from the suites passes through a public corridor onto a "corridor used by the public" or “common area” leading to an exit, provides sufficiency of compliance with Division B, Sentence 3.3.1.3.(9) and 3.3.1.4.(1) of the 2006 Building Code at 1255 Bloor Street East, Oshawa, Ontario

Reasons

i) It is the Commission's opinion that the ground floor area in question is comparable to the design of a Group B, Division 2 occupancy nursing home or hospital regulated under Article 3.3.3.5. of the Building Code. Although the ground floor area of the subject building contains a Group C major occupancy and no care is provided on this floor, the proposed design of the floor area is comparable for the following reasons:

a) Sentence 3.3.3.5.(2) requires a floor area containing patients' or residents' sleeping rooms in a hospital or nursing home to be divided into no fewer than 2 fire compartments, each not more than 1 000 m^2 in area. In this building the fire compartments on the ground floor containing residential suites are not more than 1000 m^2.

b) Sentence 3.3.3.5.(4) requires that the fire-resistance rating of the fire separation between the fire compartments must not be less than 1 h. In this building the fire separations between the fire compartments on the ground floor area are not less than 1 hour.

c) Sentence 3.3.3.5.(9) requires walls between patient's or resident's sleeping rooms and the remainder of the floor area to be constructed as fire separations but are not required to have a fire resistance rating unless it is required by other provisions of Part 3 of the Code. In this case, the resident's suites are separated from the common areas by a 1 hour fire separation.

ii) The Commission was advised that the corridors on the ground floor area have been designed to meet the minimum Code requirements for corridors, which include but are not limited to: minimum unobstructed width, smoke detectors, emergency lighting levels, flame spread ratings, maximum travel distances, no dead-end portions and no fuel fired appliances.

iii) Sentence 3.3.1.9.(5) of the Building Code states, "If a corridor contains an occupancy, the *occupancy* shall not reduce the unobstructed width of the corridor to less than its required width". Therefore, the Code permits occupancies in corridors provided the corridors are designed appropriately. Occupancies in the ground floor corridors of this building do not reduce the unobstructed width to less than 1100 mm.

iv) The dining area on the ground floor, which forms part of the corridor used by the public, is a subsidiary occupancy to the Group C occupancy use and is not required to be separated from the adjacent occupancies or corridor.

v) The dining area is only for the use for the residents of the facility and their guests.

Ruling No. 09-02-1214
Application No. 2008-37

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Clauses 3.1.5.16.(1)(b) when considering 3.1.5.2.(1)(h) of Regulation 350/06, as amended, (the Building Code).

AND IN THE MATTER OF an application by Murray Jackson, Quinte Gardens Retirement Residence, for resolution of a dispute with Ted Marecak, Chief Building Official, City of Belleville, to determine whether the installation of PVC P-traps and fixture drains installed in a high-rise building containing a Group B3 care occupancy and Group C residential occupancy provides sufficiency of compliance with Clause 3.1.5.16.(1)(b) when considering Clause 3.1.5.2.(1)(h) of the 2006 Building Code at Quinte Gardens Retirement Residence, 30 College Street West, Belleville, Ontario.

APPLICANT	Murray Jackson Quinte Gardens Retirement Residence Belleville, ON
RESPONDENT	Ted Marecak Chief Building Official City of Belleville
PANEL	Leslie Morgan, Vice-Chair Alison Orr Yaman Uzumeri
PLACE	Toronto, Ontario
DATE OF HEARING	February 5, 2009
DATE OF RULING	February 5, 2009
APPEARANCES	Dominic Janusz Atira Engineering Kingston, ON **Agent for the Applicant** Kevin Kehoe Building Inspector City of Belleville **Designate for the Respondent**

RULING

1. Particulars of Dispute

The Applicant has received an order to comply under the *Building Code Act*, *1992*, to remedy certain alleged code deficiencies at Quinte Gardens Retirement Residence at 30 College Street West, Belleville, Ontario.

The Quinte Gardens Retirement Residence is a seven storey non-combustible high-rise building containing a Group B Division 3 care occupancy on the second storey and Group C residential suites on the remaining storeys. As the floor level of the top storey of the subject building is more than 18 m above grade, the subject building is classified as a high building as per Clause 3.2.6.1.(1) (d) of the Code and is subject to the additional requirements for high buildings outlined in Subsection 3.2.6. of the Code.

The construction in dispute centers on the installation of PVC-P-traps and partial fixture drains below the sinks and lavatories within the residential suites, dining areas, pool and associated change rooms, laundry and other common areas of the subject high-rise building.

Clause 3.1.5.16.(1)(b) of the Code permits the use of combustible piping and tubing and associated adhesives provided they have a flame-spread rating of not more than 25 and, if used in a building described in Subsection 3.2.6., a smoke developed classification of not more than 50.

Article 3.1.5.2. of the Code provides a list of minor combustible components that would be permitted to be used in a building required to be of non-combustible construction.

Both the Applicant and Respondent agree that the PVC P-traps and partial fixture drains below the sinks and lavatories do not meet the Smoke Developed Classification required by Clause 3.1.15.16.(1)(b) of Division B of the Building Code. However, it is the Applicant's view that the proposed PVC P-traps and partial fixture drains are minor combustible components that are permitted by Clause 3.1.5.2.(1)(h) of Division B of the Building Code. The Respondent is not in agreement with this position.

2. Provisions of the Building Code in Dispute

3.1.5.16. Combustible Piping Materials

(1) Except as permitted by Clause 3.1.5.2.(1)(d) , Sentences (2) and (3), and Article 3.1.5.22., *combustible* piping and tubing and associated adhesives are permitted to be used in a *building* required to be of *noncombustible construction* provided that, except when concealed in a wall or concrete floor slab, they,

(a) have a *flame-spread rating* not more than 25, and

(b) if used in a *building* described in Subsection 3.2.6., have a smoke developed classification not more than 50.

3.1.5.2. Minor Combustible Components

(1) The following minor *combustible* components are permitted in a *building* required to be of *noncombustible construction*:

(a) paint,

(b) mastics and caulking materials applied to provide flexible seals between the major components of exterior wall construction,

(c) fire stop materials conforming to Sentence 3.1.9.1.(1) and Article 3.1.11.7.,

(d) tubing for pneumatic controls provided it has an outside diameter not more than 10 mm,

(e) adhesives, *vapour barriers* and sheathing papers,

(f) electrical outlet and junction boxes,

(g) wood blocking within wall assemblies intended for the attachment of handrails, fixtures, and similar items mounted on the surface of the wall, and

(h) similar minor components.

3. Applicant's Position

The Agent for the Applicant submitted that the building's waste and vent piping is non-combustible being comprised of cast iron and copper with the exception of the PVC P-Traps and partial fixture drains installed below the sinks and lavatories within the residential suites, dining areas, pool and associated change rooms, laundry and other common areas of the subject building.

The Agent argued that the Code allows combustible fixtures in a bathroom such as a vanity comprised of compressed wood, which would contribute more significantly to fire spread than the installed PVC P-Traps and partial fixture drains. The Agent maintained that the subject components could be considered "minor" as they could be deemed to insignificantly contribute to fire growth and spread, when considering other combustible materials in residential rooms and bathrooms, thus meeting the intent of the Code. Further, the Agent stated that the subject PVC components met the required flame spread rating. He conceded that the PVC P-Traps and partial fixture drains exceeded the smoke developed classification of 50 required by Article 3.1.5.16. of the Code but submitted that the classification was close to 50.

The Agent stated that the installed PVC P-Traps and partial fixture drains could be considered to be minor combustible components as per Clause 3.1.5.2.(1)(h) of the Building Code. The Agent argued that since the building was fire stopped at each floor and since the combustible components were contained within the residential suites, which are both sprinklered and separated from each other by one hour fire rated separations and do not penetrate through any unit or space to any other unit or space, the subject combustible components do not present a hazard and thus sufficiently comply with Sentence 3.1.5.16.(1) when considering Article 3.1.5.2 of the Code.

4. Respondent's Position

The Designate for the Respondent submitted that the PVC P-traps and partial fixture drains installed in all areas of the building do not meet the required smoke developed classification required by Clause 3.1.5.16.(1)(b) of Division B of the Code and that they have a smoke developed classification that is more than 50.

In addition, the Designate disputed the Applicant's position that the PVC P-traps and fixture drains could be considered "minor combustible components" as per Clause 3.1.5.2.(1)(h). The Designate maintained that Clause 3.1.5.2.(1)(h) is not contained in the list of exceptions to the general rule for non-combustible materials required by 3.1.5.16.(1).

The Designate also pointed out that other combustible piping, which conforms to Sentence 3.1.5.16.(1) of the Code is available from the same piping manufacturer.

5. Commission Ruling

It is the Decision of the Building Code Commission that the installation of PVC P-traps and fixture drains installed in a high-rise building containing a Group B3 care occupancy and Group C residential occupancy do not provide sufficiency of compliance with Clause 3.1.5.16.(1)(b) when considering Clause 3.1.5.2.(1)(h) of the 2006 Building Code at Quinte Gardens Retirement Residence, 30 College St West Belleville, Ontario.

6. Reasons

i) Sentence 3.1.5.16.(1) of the Building Code permits the use of combustible piping and tubing to be used in a building required to be of noncombustible construction provided that they have a flame-spread rating not more than 25 and, if used in a building described in Subsection 3.2.6., have a smoke developed classification not more than 50. Both the Applicant and Respondent agree that Clause 3.1.5.16.(1)(b) is applicable in this case and further, both parties agree that the PVC P-traps and fixture drains have a smoke developed classification that is more than 50, and therefore, does not comply with this Code requirement.

ii) Sentence 3.1.5.2.(1) of the Building Code lists minor combustible components which are permitted in a building that is required to be of noncombustible construction. Clause 3.1.5.2.(1)(h) permits minor combustible components similar to those listed elsewhere in Sentence 3.1.5.2.(1). It is the Commission's opinion that the subject PVC P-traps and fixture drains were not demonstrated to be similar to those listed in Sentence 3.1.5.2.(1) of the Code and, as such, the subject components are not considered to be minor combustible components.

iii) The Commission was advised that noncombustible and combustible piping materials, suitable for traps and fixture drains, which meet the minimum flame spread and smoke development classification prescribed by the Code are available.

iv) The Building Code is a minimum set of construction requirements. The Commission was not presented with any alternative measures that could compensate for non-compliance with the Building Code.

Sentence 3.3.1.17.(4) the Building Code	08-21-1195	10-Jul-08	Determine whether the as-installed guard, serving a truck loading ramp retaining wall, consisting of pipe railing with openings greater than 100 mm, provides sufficiency of compliance with Sentences 3.3.1.17.(4) and 3.3.1.17.(5) of Division B of the Building Code	Sufficiency of Compliance found
Sentence 3.3.1.17.(5) the Building Code	08-21-1195	10-Jul-08	Determine whether the as-installed guard, serving the east exit stairs located at the vehicular ramp, consisting of pipe railing with openings greater than 100 mm, provides sufficiency of compliance with Sentences 3.3.1.17.(4) and 3.3.1.17.(5) of Division B of the Building Code	Sufficiency of Compliance not found
Sentence 3.3.1.3.(8) the Building Code	08-03-1177	24-Jan-08	Determine whether the omission of the fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system provides sufficiency of compliance with Articles 3.4.4.1., 3.4.4.3., Sentences 3.3.1.3.(8), 3.3.1.3.(9), 3.3.1.4.(1), 3.3.1.14.(1) and 3.3.4.4.(7) of the Building Code	Sufficiency of Compliance found with condition(s)
Sentence 3.3.1.3.(9) the Building Code	09-03-1215	19-Mar-09	Determine whether the proposed egress system for the ground floor level of a four storey building containing Group B, Division 3 and Group C major occupancies, where one of the required means of egress from the suites passes through a public corridor into a "corridor used by the public" or “common area” leading to an exit, provides sufficiency of compliance with Division B, Sentence 3.3.1.3.(9) and 3.3.1.4.(1) of the 2006 Building Code	Sufficiency of Compliance found
Sentence 3.3.1.3.(9) the Building Code	08-03-1177	24-Jan-08	Determine whether the omission of the fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system provides sufficiency of compliance with Articles 3.4.4.1., 3.4.4.3., Sentences 3.3.1.3.(8), 3.3.1.3.(9), 3.3.1.4.(1), 3.3.1.14.(1) and 3.3.4.4.(7) of the Building Code	Sufficiency of Compliance found with condition(s)

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Sentence 3.3.1.4.(1) the Building Code	09-03-1215	19-Mar-09	Determine whether the proposed egress system for the ground floor level of a four storey building containing Group B, Division 3 and Group C major occupancies, where one of the required means of egress from the suites passes through a public corridor into a "corridor used by the public" or “common area” leading to an exit, provides sufficiency of compliance with Division B, Sentence 3.3.1.3.(9) and 3.3.1.4.(1) of the 2006 Building Code	Sufficiency of Compliance found
Sentence 3.3.1.4.(1) the Building Code	08-03-1177	24-Jan-08	Determine whether the omission of the fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system provides sufficiency of compliance with Articles 3.4.4.1., 3.4.4.3., Sentences 3.3.1.3.(8), 3.3.1.3.(9), 3.3.1.4.(1), 3.3.1.14.(1) and 3.3.4.4.(7) of the Building Code	Sufficiency of Compliance found with condition(s)
Sentence 3.3.2.2.(8)(b) the Building Code	08-31-1205	9-Oct-08	Determine whether the proposal to include the administrative offices and library spaces within the same fire compartment as the cafetorium, which has an occupant load greater than 200 persons, provides sufficiency of compliance with Clause 3.3.2.2.(8)(b) of Division B of the 2006 Building Code	Sufficiency of Compliance not found
Sentence 3.3.2.3.(10) the 1997 Building Code	07-36-1165	18-Oct-07	Determine whether the installation of the Von Duprin less bottom rod fire exit devices on doors which are required to be fire-protected provide sufficiency of compliance with Sentences 3.1.8.5.(2), 3.1.8.13.(1), 3.3.2.3.(10), Articles 3.3.1.12., and 3.4.6.15. of the 1997 Building Code	Sufficiency of Compliance found with condition(s)

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Sentence 3.3.4.2.(4) the Building Code	07-23-1152	7-Jun-07	Determine whether the, combustible eave projections will extend to within 1.2 m from the property line and where the fire separation does not extend to the underside of the roof deck, provides sufficiency of compliance with Article 3.3.4.2.(4) of the Building Code	Sufficiency of Compliance not found
Sentence 3.3.4.4.(7) the Building Code	08-03-1177	24-Jan-08	Determine whether the omission of the fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system provides sufficiency of compliance with Articles 3.4.4.1., 3.4.4.3., Sentences 3.3.1.3.(8), 3.3.1.3.(9), 3.3.1.4.(1), 3.3.1.14.(1) and 3.3.4.4.(7) of the Building Code	Sufficiency of Compliance found with condition(s)
Article 3.3.5.6. the Building Code	07-23-1152	7-Jun-07	Determine whether the proposed construction of a Group B, Division 3 care occupancy, where the proximity of the nearest fire hydrant is approximately 90 m from the building, the fire resistance rating of the fire separation between the single car storage garage and the remainder of the building is less than 1. 5 h, provides sufficiency of compliance with Articles 3.1.8.3., 3.2.3.6., 3.3.5.6., Sentences 3.2.5.16.(2) and 3.3.4.2.(4) of the Building Code	Sufficiency of Compliance found
Article 3.4.4.1. the Building Code	08-03-1177	24-Jan-08	Determine whether the omission of the fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system provides sufficiency of compliance with Articles 3.4.4.1., 3.4.4.3., Sentences 3.3.1.3.(8), 3.3.1.3.(9), 3.3.1.4.(1), 3.3.1.14.(1) and 3.3.4.4.(7) of the Building Code	Sufficiency of Compliance found with condition(s)

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Article 3.4.4.3. the Building Code	08-03-1177	24-Jan-08	Determine whether the omission of the fire rated shutter between the tenant balconies and the exterior passageway in the design of the exit and egress system provides sufficiency of compliance with Articles 3.4.4.1., 3.4.4.3., Sentences 3.3.1.3.(8), 3.3.1.3.(9), 3.3.1.4.(1), 3.3.1.14.(1) and 3.3.4.4.(7) of the Building Code	Sufficiency of Compliance found with condition(s)
Article 3.4.6.15. the 1997 Building Code	07-36-1165	18-Oct-07	Determine whether the installation of the Von Duprin less bottom rod fire exit devices on doors which are required to be fire-protected provide sufficiency of compliance with Sentences 3.1.8.5.(2), 3.1.8.13.(1), 3.3.2.3.(10), Articles 3.3.1.12., and 3.4.6.15. of the 1997 Building Code	Sufficiency of Compliance found with condition(s)
Sentence 3.4.6.5.(8) the Building Code	07-42-1171	22-Nov-07	Determine whether the proposed guard, serving exterior exit stairs in a Group F, Division 2 industrial occupancy building and having been designed with horizontal members which will be located between 140 mm and 900 mm above the level being protected, provides sufficiency of compliance with Sentence 3.4.6.5.(8) of the Building Code	Sufficiency of Compliance found with condition(s)
Sentence 3.6.3.1.(1) the Building Code	07-34-1163	20-Sep-07	Determine whether the vertical and horizontal piping for the proposed standpipe system which would not be protected with a two-hour fire rated separation provides sufficiency of compliance with Sentence 3.2.9.2.(1) and Clause 3.2.9.2.(9)(b) when considering Sentence 3.6.3.1.(1) of the Building Code	Sufficiency of Compliance found with condition(s)
Sentence 3.6.3.1.(1) the Building Code	07-33-1162	20-Sep-07	Determine whether the vertical and horizontal piping for the proposed standpipe system which would not be protected with a two-hour fire rated separation provides sufficiency of compliance with Sentence 3.2.9.2.(1) and Clause 3.2.9.2.(9)(b) when considering Sentence 3.6.3.1.(1) of the Building Code	Sufficiency of Compliance found with condition(s)
Sentence 3.6.3.1.(2) the 1997 Building Code	08-11-1185	20-Mar-08	Determine whether the proposal to terminate the fire separation for the vertical service space at the underside of the fourth storey roof, in an addition to a Group B, Division 2 care and treatment occupancy, provides sufficiency of compliance with Sentence 3.6.3.1.(2) of the 1997 Building Code	Sufficiency of Compliance found

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Sentence 3.7.4.2.(2) the 1997 Building Code	08-38-1212	11-Dec-08	Determine whether the proposed revised design of a multi-use building with Group C and Group A Division 2 occupancies, where the Group A Division 2 occupancy will be served by one barrier-free washroom and one additional washroom and where both washrooms are intended to serve both sexes, provides sufficiency of compliance with Sentence 3.7.4.2.(2) and Table 3.7.4.3. A. of the 1997 Building Code	Sufficiency of Compliance found with condition(s)
Table 3.7.4.3. A. the 1997 Building Code	08-38-1212	11-Dec-08	Determine whether the proposed revised design of a multi-use building with Group C and Group A Division 2 occupancies, where the Group A Division 2 occupancy will be served by one barrier-free washroom and one additional washroom and where both washrooms are intended to serve both sexes, provides sufficiency of compliance with Sentence 3.7.4.2.(2) and Table 3.7.4.3. A. of the 1997 Building Code	Sufficiency of Compliance found with condition(s)
Article 6.2.1.4. the 1997 Building Code	08-05-1179	7-Feb-08	Determine whether the as-installed ground source heat pump/geothermal system provides sufficiency of compliance with Article 6.2.1.4. of the Building Code	Sufficiency of Compliance found with condition(s)
Article 7.1.5.4. the Building Code	08-29-1203	13-Nov-08	Determine whether the proposed system of piping to be built in conformance with Article 7.1.5.5. of the Building Code, which includes connections to multiple buildings on a single property that will be serviced by a single connection between the private sewer and the public sanitary sewer and two connections between the private water supply and the public water supply, sufficiently complies with Article 7.1.5.4. of the 2006 Building Code	Sufficiency of Compliance found
Article 7.2.5.9. the 1997 Building Code	08-27-1201	7-Aug-08	Determine whether the as-installed CPVC SCH 80 distribution piping, used in a drainage application in a food processing plant, as an alternative to ABS and PVC piping, provides sufficiency of compliance with Article 7.2.5.9. of the 1997 Building Code	Sufficiency of Compliance not found

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Sentence 7.3.3.11.(1) the Building Code	08-06-1180	7-Feb-08	Determine whether the plumbing system which has been installed to provide service to an additional washroom on the second floor of a two storey, Group C, residential dwelling provides sufficiency of compliance with Article 7.4.8.2., Sentences 7.3.3.11.(1), 7.3.6.1.(1), 7.3.7.1.(1), 7.4.7.1.(2), Clause 7.5.7.1.(1)(a), Subclauses 7.5.5.3.(1)(a)(ii), 7.5.7.1.(1)(d)(iii), and Table 7.4.10.3.A. of the Building Code	Sufficiency of Compliance not found
Sentence 7.3.6.1.(1) the Building Code	08-06-1180	7-Feb-08	Determine whether the plumbing system which has been installed to provide service to an additional washroom on the second floor of a two storey, Group C, residential dwelling provides sufficiency of compliance with Article 7.4.8.2., Sentences 7.3.3.11.(1), 7.3.6.1.(1), 7.3.7.1.(1), 7.4.7.1.(2), Clause 7.5.7.1.(1)(a), Subclauses 7.5.5.3.(1)(a)(ii), 7.5.7.1.(1)(d)(iii), and Table 7.4.10.3.A. of the Building Code	Sufficiency of Compliance not found
Sentence 7.3.7.1.(1) the Building Code	08-06-1180	7-Feb-08	Determine whether the plumbing system which has been installed to provide service to an additional washroom on the second floor of a two storey, Group C, residential dwelling provides sufficiency of compliance with Article 7.4.8.2., Sentences 7.3.3.11.(1), 7.3.6.1.(1), 7.3.7.1.(1), 7.4.7.1.(2), Clause 7.5.7.1.(1)(a), Subclauses 7.5.5.3.(1)(a)(ii), 7.5.7.1.(1)(d)(iii), and Table 7.4.10.3.A. of the Building Code	Sufficiency of Compliance not found

Sentence 8.9.1.2.(1) (c) of the Building Code	07-38-1167	13-Dec-07	Determine whether the proposed construction of seven (7) individual Class 4 sewage systems to service seven (7) individual residential dwellings provides sufficiency of compliance with Sentences 8.2.1.2.(1), 8.2.1.2.(3), Clauses 8.7.3.2.(2)(e), 8.7.4.2.(1)(b), 8.9.1.2.(1)(c) and Subclause 8.7.2.1.(1)(b)(i) of the Building Code	No Jurisdiction
Sentence 9.1.1.1. of the Building Code	07-35-1164	18-Oct-07	Determine whether the proposed construction of a Group C residential townhouse block provides sufficiency of compliance with Subsection 2.1.1. as a three storey building when considering the definition of “grade” as outlined in Article 1.1.3.2., Article 3.2.2.45. and 9.1.1.1. of the Building Code	Sufficiency of Compliance not found

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Sentence 9.8.4.1.(1) of the Building Code	07-29-1158	23-Aug-07	Determine whether the as-installed interior stair, where the structural post for the handrail projects more than 100 mm into the required width of the stairway and similarly projects into the width of the landing at the bottom of the stair, provide sufficiency of compliance with Sentences 9.8.4.1.(1) and 9.8.7.6.(1) of the Building Code and further whether the door that swings outward over a 325 mm exterior step serving a second storey balcony provides sufficiency of compliance with Sentences 9.8.4.1.(1) and 9.8.4.2.(2) of the Building Code	Sufficiency of Compliance found
Sentence 9.8.4.2.(2) of the Building Code	07-29-1158	23-Aug-07	Determine whether the as-installed interior stair, where the structural post for the handrail projects more than 100 mm into the required width of the stairway and similarly projects into the width of the landing at the bottom of the stair, provide sufficiency of compliance with Sentences 9.8.4.1.(1) and 9.8.7.6.(1) of the Building Code and further whether the door that swings outward over a 325 mm exterior step serving a second storey balcony provides sufficiency of compliance with Sentences 9.8.4.1.(1) and 9.8.4.2.(2) of the Building Code	Sufficiency of Compliance not found
Sentence 9.8.4.4. of the Building Code	09-05-1217	9-Apr-09	Determine whether that the as-installed prefabricated steel spiral staircase serving a mezzanine of a residential dwelling provides sufficiency of compliance with Articles 3.3.1.15. and 9.8.4.4. of the 2006 Building Code	Sufficiency of Compliance not found
Sentence 9.8.8.3 (2) of the Building Code	08-37-1211	11-Dec-08	Determine whether the as installed guards, having been constructed to a height of 754 mm, serving two sets of stairs in a two storey, seasonal residential dwelling, provide sufficiency of compliance with Sentences 9.8.8.3 (2) and 9.8.8.3 (4) of the 2006 Building Code	Sufficiency of Compliance found
Sentence 9.8.8.3 (4) of the Building Code	08-37-1211	11-Dec-08	Determine whether the as installed guards, having been constructed to a height of 754 mm, serving two sets of stairs in a two storey, seasonal residential dwelling, provide sufficiency of compliance with Sentences 9.8.8.3 (2) and 9.8.8.3 (4) of the 2006 Building Code	Sufficiency of Compliance found

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Sentence 9.8.8.5. of the 1997 Building Code	08-32-1206	9-Oct-08	Determine whether the guards installed to serve the newly constructed rear deck and front entrance landing of a residential building, where the new guards have been designed to replicate the existing guards provide sufficiency of compliance with Articles 9.8.8.5. of the 1997 Building Code or Article 9.8.8.6. of the 2006 Building Code	Sufficiency of Compliance not found
Sentence 9.8.8.6. of the 1997 Building Code	08-32-1206	9-Oct-08	Determine whether the guards installed to serve the newly constructed rear deck and front entrance landing of a residential building, where the new guards have been designed to replicate the existing guards provide sufficiency of compliance with Articles 9.8.8.5. of the 1997 Building Code or Article 9.8.8.6. of the 2006 Building Code	Sufficiency of Compliance not found
Sentence 9.8.8.6. of the Building Code	09-22-1234	22-Oct-09	Determine whether the as-installed guard, serving the flight of steps from the main floor to the lower level of a residential dwelling provides sufficiency of compliance with Article 9.8.8.6. of Division B of the Building Code	Sufficiency of Compliance found
Sentence 9.9.4.4.(1) of the Building Code	07-41-1170	8-Nov-07	Determine whether the proposed relocation and subsequent renovation of the exterior, unenclosed exit stair, with adjacent unprotected openings, in an existing building with mixed-use occupancy, provides sufficiency of compliance with Sentence 9.9.4.4.(1) when considering Part 11 of the Building Code	Sufficiency of Compliance found
Sentence 9.10.12.3. of the Building Code	07-39-1168	8-Nov-07	Determine whether the proposal to include unprotected openings in the exposing building faces in multiple units of a two storey townhouse building, where there are limiting distances of less than 1.2 m between fire compartments of the same property, provides sufficiency of compliance with Articles 9.10.12.3. and 9.10.15.4. of the Building Code	No Jurisdiction

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Sentence 9.10.15.4. of the Building Code	07-39-1168	8-Nov-07	Determine whether the proposal to include unprotected openings in the exposing building faces in multiple units of a two storey townhouse building, where there are limiting distances of less than 1.2 m between fire compartments of the same property, provides sufficiency of compliance with Articles 9.10.12.3. and 9.10.15.4. of the Building Code	No Jurisdiction
Sentence 9.10.18.1. of the Building Code	07-25-1154	5-Jul-07	Determine whether the as-installed 12 volt alarm system, consisting of smoke alarms and carbon monoxide detectors, where the smoke alarms, conforming to CAN/ULC-S553-02 and NFPA 72, are connected to a 30 watt siren located in the basement of a Group C residential dwelling, provides sufficiency of compliance with Articles 9.10.18.1., 9.10.18.3., 9.10.18.4., and 9.33.4.3. of the Building Code	Sufficiency of Compliance not found
Sentence 9.10.18.3. of the Building Code	07-25-1154	5-Jul-07	Determine whether the as-installed 12 volt alarm system, consisting of smoke alarms and carbon monoxide detectors, where the smoke alarms, conforming to CAN/ULC-S553-02 and NFPA 72, are connected to a 30 watt siren located in the basement of a Group C residential dwelling, provides sufficiency of compliance with Articles 9.10.18.1., 9.10.18.3., 9.10.18.4., and 9.33.4.3. of the Building Code	Sufficiency of Compliance found
Sentence 9.10.18.4. of the Building Code	07-25-1154	5-Jul-07	Determine whether the as-installed 12 volt alarm system, consisting of smoke alarms and carbon monoxide detectors, where the smoke alarms, conforming to CAN/ULC-S553-02 and NFPA 72, are connected to a 30 watt siren located in the basement of a Group C residential dwelling, provides sufficiency of compliance with Articles 9.10.18.1., 9.10.18.3., 9.10.18.4., and 9.33.4.3. of the Building Code	Sufficiency of Compliance found
Sentence 9.19.1.1.(1) of the Building Code	08-24-1198	24-Jul-08	Determine whether the proposal to install a roof assembly, where medium density, closed-cell spray polyurethane foam will be installed to insulate the roof, and where no vents will be installed in the roof assembly, provides sufficiency of compliance with Sentence 9.19.1.1.(1) of Division B of the 2006 Building Code	Sufficiency of Compliance found with condition(s)

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
Sentence 9.23.10.4.(1) of the Building Code	08-28-1202	13-Aug-08	Determine whether the as-installed wood stud walls, where butt jointed studs have been used in a non-load bearing wall on the 2nd and 3rd storey public corridors of a 3 storey residential building, provide sufficiency of compliance with Sentence 9.23.10.4.(1) of Division B of the 2006 Building Code	Sufficiency of Compliance found
Sentence 9.30.6.3. of the 1997 Building Code	08-23-1197	24-Jul-08	Determine whether the as- installed ceramic tile flooring, where the ceramic tile has been applied directly to the subfloor with a scratch coat adhesive mortar (thin-set method), on a subfloor of 15.5 mm softwood plywood conforming to CSA 0151 or 15 mm OSB subfloor conforming to CSA 0325 with a reduced joist spacing of 300 mm (12 in.) on centre below the tiled areas, sufficiently complies with Article 9.30.6.3. of the 1997 Ontario Building Code	Sufficiency of Compliance found
Sentence 9.33.4.3 of the 1997 Building Code	07-25-1154	5-Jul-07	Determine whether the as-installed 12 volt alarm system, consisting of smoke alarms and carbon monoxide detectors, where the smoke alarms, conforming to CAN/ULC-S553-02 and NFPA 72, are connected to a 30 watt siren located in the basement of a Group C residential dwelling, provides sufficiency of compliance with Articles 9.10.18.1., 9.10.18.3., 9.10.18.4., and 9.33.4.3. of the Building Code	Sufficiency of Compliance not found
Sentence 11.4.2.5 (3) of the Building Code	08-16-1190	8-May-08	Determine whether the proposal to construct an addition to a one storey, two bedroom, seasonal cottage, which will increase the size of the existing cottage by 29.5%, and that will be served by the existing Class 5 sewage system with a 9000L capacity, provides sufficiency of compliance with Sentence 11.4.2.5 (3) of Division B of the 2006 Building Code	Sufficiency of Compliance found

BUILDING CODE COMMISSION
DECISIONS BY REFERENCE TO SECTIONS OF THE BUILDING CODE ACT
2007-2009

EDITORS NOTE: The references in column 1 are to references or numbered sections in the Building Code Act at the time of the decision.

BUILDING CODE ACT REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
"Building" of the Act	08-26-1200	19-Jun-08	Determine whether the as-constructed "fishing deck" can be considered a "building" that provides sufficiency of compliance with the definition of "building" as outlined in the *Building Code Act*,	No Jurisdiction
8(2.2) of the Act	09-08-1220	19-May-09	Determine whether the Chief Building Official complied with the requirements of Subsections 8(2.2) and 8(2.3) of the *Building Code Act, 1992* and Division C, Sentence 1.3.1.3.(1) of the Building Code to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal within the time period set out in Table 1.3.1.3. of the Building Code	Chief Building Official complied
8(2.2) of the Act	08-33-1207	17-Oct-08	Whether the Chief Building Official complied with the requirements of Subsections 8(2.2) and 8(2.3) of the *Building Code Act, 1992* and Division C, Sentence 1.3.1.3.(1) of the Building Code to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal within the time period set out in Table 1.3.1.3. of the Building Code	Chief Building Official did not comply

BUILDING CODE REFERENCE	BCC RULING NO.	DATE OF RULING	SHORT DESCRIPTION	DISPOSITION
8(2.2) of the Act	07-21-1150	1-Jun-07	Whether the Chief Building Official complied with the requirements under Subsections 8(2.2) and 8(2.3) of the Act and Division C, Sentence 1.3.1.3.(1) of the Building Code to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal within the time period set out in Table 1.3.1.3. of the Building Code	Chief Building Official complied
8(2.3)	09-08-1220	19-May-09	Determine whether the Chief Building Official complied with the requirements of Subsections 8(2.2) and 8(2.3) of the *Building Code Act, 1992* and Division C, Sentence 1.3.1.3.(1) of the Building Code to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal within the time period set out in Table 1.3.1.3. of the Building Code	Chief Building Official complied
8(2.3)	07-21-1150	1-Jun-07	Whether the Chief Building Official complied with the requirements under Subsections 8(2.2) and 8(2.3) of the Act and Division C, Sentence 1.3.1.3.(1) of the Building Code to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal within the time period set out in Table 1.3.1.3. of the Building Code	Chief Building Official complied
8(2.3)	08-33-1207	17-Oct-08	Whether the Chief Building Official complied with the requirements of Subsections 8(2.2) and 8(2.3) of the Building Code Act, 1992 and Division C, Sentence 1.3.1.3.(1) of the Building Code to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal within the time period set out in Table 1.3.1.3. of the Building Code	Chief Building Official did not comply

BUILDING CODE COMMISSION
DECISIONS BY STATUTORY REFERENCE
UNDER THE 1997-2006 & 2007 BUILDING CODES (REGULATIONS 403/97 & 350/06)

EDITORS NOTE: The statutory references in column 1 are to the so-numbered article/section in the building regulation at the time of the decision (O. reg. 403/97). The statutory references in column 1A are to the comparable article/section in the 2007 Building Code (O. reg. 350/06, as amended).

PART 1

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
1.1.3.1.	Div. A 1.4.1.1	01-53-846	2001	25-Oct-01	Determine whether the ground floor amenity space (exercise room, swimming pool, change room and lounge), that is not proposed to be sprinklered, in a building containing a Group C major occupancy, provides sufficiency of compliance with s 3.2.2.6., 3.2.2.23. and s 3.2.2.7.(1) and 3.2.2.8.(1)	283/01
1.1.3.1.(1)	Div. A 1.4.1.1.	05-01-1015		13-Jan-05	Determine whether the storage structure, referred to by the Applicant as a tent, provides sufficiency of compliance with Sentences 1.1.3.1.(1) and 2.1.1.3.(1), Subsection 3.13.1. and Sentence 9.1.1.4.(1)	
1.1.3.2.	Div. A. 1.4.1.2.	05-15-1029		21-Apr-05	Determine whether the installation of a septic field remediation technology known as the White KnightTM into an existing septic tank provides sufficiency of compliance with the Building Code when considering Part 11 and the definition of “septic tank” as outlined in Article 1.1.3.2.	
1.1.3.2.	Div. A. 1.4.1.2	01-53-846	2001	25-Oct-01	Determine whether the ground floor amenity space (exercise room, swimming pool, change room and lounge), that is not proposed to be sprinklered, in a building containing a Group C major occupancy, provides sufficiency of compliance with s 3.2.2.6., 3.2.2.23. and s 3.2.2.7.(1) and 3.2.2.8.(1)	283/01

1.1.3.2.	Div. A. 1.4.1.2	03-52-950	2003	1-Mar-04	Determine whether the proposed replacement of a Class 4 sewage system that is located on a “lot or parcel of land” that is serviced by additional Class 4 systems complies with the definition of sewage system in 1.1.3.2. of the Ontario Building Code, when considering that the lot is located adjacent to two lots that are all under the same ownership	220/02
1.1.3.2.(1)	Div. A. 1.4.1.2.	06-02-1072		12-Jan-06	Determine whether the 4th level “loft” design in a residential townhouse development provides sufficiency of compliance with the definition of “mezzanine” contained in Sentence 1.1.3.2.(1) and with the provisions of Sentence 9.10.4.1.(2)	
1.1.3.2.	Div. A. 1.4.1.2.	05-06-1020		17-Feb-05	Determine whether the lower floor of the subject building qualifies as a ground floor when considering the definitions for “grade” and “first storey” as specified in Article 1.1.3.2.	
1.1.3.2.(1)	Div. A. 1.4.1.2.	04-34-989		5-Aug-4	Determine whether the existing outdoor portable metal containers that are used for public storage are considered to be “buildings” under Section 1.-(1) of the *Building Code Act, 1992*	220/02
1.1.3.2.	Div. A. 1.4.1.2	99-74-730	1999	9-Dec-99	Determine whether the proposed live/work units measuring 146.7 m2 in area, excluding stairs and unfinished basements, comply with the definition of live/work units provided in 1.1.3.2	278/99
1.1.3.2.	Div. A. 1.4.1.2	00-23-755	2000	25-May-00	Determine whether the intended use of the proposed building, as a home for ambulatory individuals with disabilities, complies with the definition of "Residential Occupancy" as set out in 1.1.3.2	205/00
1.1.3.2.	Div. A. 1.4.1.2	99-60-716	1999	23-Sep-99	Determine whether the proposed new arena built adjoining to the existing retail mall as one, albeit expanded, building constructed on two properties complies with 3.2.3.4. of the Ontario Building Code (OBC), and if so, whether the proposed design, without the provision of a fire separation with a two hour fire resistance rating complete with closures or special interconnected floor space fire safety measures, provides sufficiency of compliance with 3.2.8.1.(1)	278/99
1.1.3.2.	Div. A. 1.4.1.2	99-62-718	1999	21-Oct-99	Determine whether the definition of "exit" as set out in 1.1.3.2. and 3.4.4.1.(1)	278/99
1.1.3.2.	Div. A. 1.4.1.2	00-38-770	2000	10-Aug-00	Determine whether the proposed elevated platform should be considered a stage and must therefore comply with 3.3.2.12.	205/00

PART 2

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
Part 2	Div. B Part 3	02-12-867	2002	21-Mar-02	Determine whether the proposed renovation and repair of an existing residential structure provide sufficiency of compliance with the relevant provisions of Parts 2 and 11	283/01
2.1.1.7.	Div. B 1.2.2.1	00-27-759	2000	21-Sep-00	Determine whether the subject commercially-used log house, which was disassembled, rebuilt at another location and provided with a barrier-free path of travel, is required to provide barrier-free accessibility in the proposed new washroom when considering 2.1.1.7.(2) and 9.5.2.1	205/00
2.1.1.11		00-31-763	2000	29-Jun-00	Determine whether the proposed fabric material roof, which is not considered as a Class A, B or C roof covering, provides sufficiency of compliance with 3.1.15.2.(1)	205/00
2.4.1.1.(5)	Div. C. 1.3.1.1.(5)	04-09-964		4-Mar-04	Determine whether the existing enclosed canopy, intended for use as an indoor and outdoor patio, which is attached to the wall of an existing Group A, Division 2 occupancy, provides sufficiency of compliance with Sentence 2.4.1.1.(5)	
2.4.1.1B.(1), Table 2.4.4.1B.	Div C. 1.3.1.3 Table 1.3.1.3.	06-48-1118		21-Nov-06	Whether the Chief Building Official complied with the requirements under Subsections 8(2.2) and 8(2.3) of the Act and Sentence 2.4.1.1B.(1) of the Building Code to issue or refuse to issue the permit and, in the case of a refusal to issue the permit, to provide in writing all of the reasons for the refusal within the time period set out in Table 2.4.4.1B.	
2.6.2.1.		00-28-760	2000	14-Jun-00	Determine whether the proposed installation of a single fan unit providing 24 L/s exhaust on a continuous basis to serve a bathroom with two fixtures requiring ventilation provides sufficiency of compliance with 6.2.3.9.(12)	205/00
2.7.2.1.		02-30-885	2002	3-Oct-02	Determine whether the proposed drip irrigation leaching bed sewage system provides sufficiency of compliance with Part 8 when considering s 2.7.2.1. and 2.7.2.2.	283/01
2.7.2.2.		02-30-885	2002	3-Oct-02	Determine whether the proposed drip irrigation leaching bed sewage system provides sufficiency of compliance with Part 8 when considering s 2.7.2.1. and 2.7.2.2.	02-30-885

PART 3

1		2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
3.1.2.1.	Div. B 3.1.2.1.	00-48-780	2000	7-Sep-00	Determine whether, due to the consideration of the building as an existing structure and proposed construction of two additions, the classification of the entire structure as per 3.1.2.1.	205/00
3.1.2.1.	Div. B 3.1.2.1.	00-52-784	2000	19-Oct-00	Determine whether the restaurant and fixed seat grandstand areas of the proposed new racetrack facility can be considered as sharing the same major occupancy in accordance with s 3.1.2.1. and 3.1.3.1.	205/00
3.1.2.5.	Div. B 3.1.2.5.	00-23-755	2000	25-May-00	Determine whether the intended use of the proposed building, as a home for ambulatory individuals with disabilities, complies with the definition of “Residential Occupancy” as set out in 1.1.3.2	205/00
3.1.3.1.	Div. B 3.1.3.1.	00-52-784	2000	19-Oct-00	Determine whether the restaurant and fixed seat grandstand areas of the proposed new racetrack facility can be considered as sharing the same major occupancy in accordance with s 3.1.2.1. and 3.1.3.1.	205/00
3.1.3.2.(2) 3.1.3.2.(4)	Div. B 3.1.3.2.(2) 3.1.3.2.(4)	05-13-1027		14-Apr-05	Determine whether the proposed public use self-storage facility, having a Group F, Division 2, medium hazard industrial occupancy can be located in the basement level of a building currently designated for Group C, residential occupancy and Group E, retail purposes, provides sufficiency of compliance with Sentences 3.1.3.2.(2) and 3.1.3.2.(4)	

3.1.5.1.	Div. B 3.1.5.1.(1)	00-24-756	2000	25-May-00	Determine whether the proposed roof assembly, which is to be constructed with fibreglass reinforced polymer panels, provides sufficiency of compliance with 3.1.5.1.(1)	205/00

3.1.5.3.	Div. B 3.1.5.3.	99-57-713	1999	26-Aug-99	Determine whether the proposed roof assembly that includes fireretardant plywood sheathing on Z-girts with a 25 mm air space and R19 fibreglass batt insulation mounted on a 38 mm metal decking provides sufficiency of compliance with 3.1.5.3.(1) and (20)	278/99
3.1.5.3.	Div. B 3.1.5.3.	00-05-737	2000	3-Feb-00	Determine whether the proposed roof assembly that includes fireretardant plywood sheathing on Z-girts with a 25 mm air space and RSI 3.25 mineral fibre insulation mounted on a 38 mm decking provides sufficiency of compliance with 3.1.5.3.(2)	597/99
3.1.5.3.	Div. B 3.1.5.3.	02-22-877	2002	1-Aug-02	Determine whether the proposed natural gas fireplaces to be located in the Fireplace Lounges, which constitute extensions of public corridors leading to exits in sites 1 and 3, provide sufficiency of compliance with 3.3.1.2.(3), and whether the proposed use of glued-laminated heavy timber beams and purlins as well as plywood sheathing for attachment of copper roofing in the construction of the roof assembly of the fireplace lounge in site 3, provides sufficiency of compliance with s 3.2.2.43.(2), 3.2.2.16.(1) and 3.1.5.3.(2)	283/01

3.1.5.5.	Div. B 3.1.5.5.	02-11-866	2002	14-Mar-02	Determine whether the combustible wood screen cladding proposed on the exterior of the north, east and south faces of a parking structure provides sufficiency of compliance with 3.1.5.5.(1), (2) and (3)	283/01
3.1.5.5.	Div. B 3.1.5.5.	02-11-866	2002	14-Mar-02	Determine whether the combustible wood screen cladding proposed on the exterior of the north, east and south faces of a parking structure provides sufficiency of compliance with 3.1.5.5.(1), (2) and (3)	283/01

3.1.5.7.	Div. B 3.1.5.7.	03-28-926	2003	3-Jul-03	Determine whether the proposed manufactured mouldings intended for use in a building required to be of non-combustible construction provide sufficiency of compliance with 3.1.5.7.	220/02

3.1.5.11.(3)	Div. B. 3.1.5.12.(3)	04-51-1006		17-Jan-05	Determine whether the proposed exterior wall system that incorporates foamed plastic insulation and exterior cladding in an exterior wall of a Group C (Part 3) major occupancy building provides sufficiency of compliance with Sentences 3.2.3.7.(1) and 3.1.5.11.(3)	

3.1.5.12.	Div. B 3.1.5.11	00-56-788	2000	16-Nov-00	Determine whether the proposed partition walls and corridor configuration provide sufficiency of compliance with s 3.1.5.12.(3), 3.2.2.24.(2), 3.3.1.1.(1), and 3.3.1.4.(3)	205/00

3.1.5.16.	Div. B 3.1.5.13	00-35-767	2000	27-Jul-00	Determine whether the proposed sprinklering of certain bathrooms, offered as a compensating measure in lieu of meeting the required flame-spread rating and smoke developed classification with respect to the as-installed whirlpool bathtubs, provides sufficiency of compliance with s 3.1.5.16., 3.1.13.3. and 3.1.13.7.(1)	205/00

3.1.5.22.	Div. B 3.1.5.23	99-30-686	1999	13-May-99	Determine whether the proposed vinyl fabric roof on an aluminium frame to serve as a cover for the garden centre provides sufficiency of compliance with 3.1.5.22	278/99
3.1.5.22.	Div. B 3.1.5.23	00-39-771	2000	10-Aug-00	Determine whether the as-constructed building, which does not provide protection on a floor area with a barrier-free path of travel, which has a combustible canopy and which does not offer a separate heat detection system, provides sufficiency of compliance with 3.3.1.7., 3.1.5.22.(2) and 3.2.4.11.(2)(b) respectively	205/00

3.1.7.3.	Div. B 3.1.7.3.	02-10-865	2002	14-Mar-02	Determine whether the two hour fire separation between proposed A2 and existing F3 occupancies, that is penetrated by roof trusses (supported by the structural members of the separation), provides sufficiency of compliance with 3.1.7.3.(2) and s 3.1.8.1.(1)(a) and (b)	283/01

3.1.8.1.	Div. B 3.1.8.1.	02-10-865	2002	14-Mar-02	Determine whether the two hour fire separation between proposed A2 and existing F3 occupancies, that is penetrated by roof trusses (supported by the structural members of the separation), provides sufficiency of compliance with 3.1.7.3.(2) and s 3.1.8.1.(1)(a) and (b)	283/01
3.1.8.1	Div. B 3.1.8.1	00-61-793	2000	14-Dec-00	Determine whether the main arena seating bowl, in particular the number of seats, row widths, vomitory and aisle width, exits and access to exits and the smoke protection system, designed based on NFPA 101, "Life Safety Code" and NFPA 92B "Smoke Management Systems in malls atria, and large areas," provides sufficiency of compliance with s 3.3.2.3, 3.3.2.4, 3.4.3.4, 3.1.8.1, and 3.2.5.13(1)	205/00

3.1.8.7	Div. B 3.1.8.7	01-52-845	2001	25-Oct-01	Determine whether the compensating measures offered in a multi-tenant building containing Group F, Division 2 and Group D occupancies where the dedicated fume hood ductwork traversesthe2-hour fire separations between floors ,will provide sufficiency of compliance with s 3.1.8.7. and 3.1.8.8.	283/01

3.1.8.8.	Div. B 3.1.8.8.	01-52-845	2001	25-Oct-01	Determine whether the compensating measures offered in a multi-tenant building containing Group F, Division 2 and Group D occupancies where the dedicated fume hood ductwork traversesthe2-hour fire separations between floors ,will provide sufficiency of compliance with s 3.1.8.7. and 3.1.8.8.	283/01

3.1.8.12.	Div. B 3.1.8.12.	99-29-685	1999	29-Apr-99	Determine whether the proposed sprinkler system to be installed throughout the North Infill portion of the subject building compensates for the lack of a rated roof assembly provided for the North Infill area thereby providing sufficiency of compliance with 3.2.2.17., and whether the proposed hold-open devices at the eight doors between the North Infill, the North Wing and the Link area comply with 3.1.8.12.	122/98
3.1.8.12.	Div. B	01-44-837	2001	27-Sep-01	Determine whether the distance from the rear of the dressing room area to an exit (in excess of 45 m) and the doors to the ice resurfacing room, that are not equipped with self-closing devices activated by a smoke detector, provide sufficiency of compliance with 3.4.2.5.(1)(c) and 3.1.8.12.(3)	205/00

3.1.8.13.	Div. B 3.1.8.13.	99-05-661	1999	27-Jan-99	Determine whether the entrance doors, as installed, provides sufficiency of compliance with 3.1.8.13.	395/96

3.1.8.16.	Div. B 3.1.8.16.	99-61-717	1999	23-Sep-99	Determine whether the proposed four wired glass panels, none of which exceed 0.8 m2 ,but which have an aggregate area of 1.9 m2 , as part of a wall assembly providing a 3/4 hour fire-resistance rating complies with 3.1.8.16	395/96
3.1.8.16.	Div. B 3.1.8.16.	99-48-704	1999	8-Jul-99	Determine whether the recently constructed upgraded, noncombustible, one hour rated, pressed steel frame with wired glass panels and a 45 minute rated hollow metal door designed to match the existing exit stairwell enclosure provides sufficiency of compliance with 3.1.8.16	395/96

3.1.9.1.	Div. B 3.1.9.1.	98-47-652	1998	3-Dec-98	Determine whether the proposed installation of combustible piping penetrations through fire separations, with a modified system of fire stopping, in a sprinklered building complies with s 3.1.9.1. and 3.1.9.4	122/98
3.1.9.4.	Div. B 3.1.9.4.	98-47-652	1998	3-Dec-98	Determine whether the proposed installation of combustible piping penetrations through fire separations, with a modified system of fire stopping, in a sprinklered building complies with s 3.1.9.1. and 3.1.9.4	122/98
3.1.10.	Div. B 3.1.10.	00-15-747	2000	29-Mar-00	Determine the applicability and/or compliance with s 3.2.8.1.(3) and 3.2.8.2.(6) of the Ontario Building Code (OBC) regarding the proposed main floor interconnected floor space, whether the proposed design of the second floor corridor complies with OBC 3.3.3.3.(1), and whether the proposed connection to the adjacent existing building provides sufficiency of compliance with OBC Subsection 3.1.10. or 3.2.3.1.(1)(b) and 3.2.3.7.(1)	597/99
3.1.10.5.	3.1.10.5.	05-03-1017		19-Jan-05	Determine whether the size and positioning of openings in the as-constructed firewalls provide sufficiency of compliance with Article 3.1.10.5.	
3.1.11.7.	Div. B 3.1.11.7.	02-04-859	2002	16-Jul-02	Determine whether the proposed foam plastic insulation and metal cladding system provides sufficiency of compliance with s 3.2.3.7.(7) and (8) when considering s 3.1.11.7. (1) and (2)	283/01
3.1.13.7.	Div. B 3.1.13.7.	00-35-767	2000	27-Jul-00	Determine whether the proposed sprinklering of certain bathrooms, offered as a compensating measure in lieu of meeting the required flame-spread rating and smoke developed classification with respect to the as-installed whirlpool bathtubs, provides sufficiency of compliance with s 3.1.5.16., 3.1.13.3. and 3.1.13.7.(1)	205/00
3.1.15.	Div. B 3.1.15	02-18-873	2002	20-Jun-02	Determine whether the proposed fabric material roof which is not considered as a Class A, B or C roof covering, provides sufficiency of compliance with Section 3.1.15.	283/01
3.1.15.2.	Div. B 3.1.15.2.	00-31-763	2000	29-Jun-00	Determine whether the proposed fabric material roof, which is not considered as a Class A, B or C roof covering, provides sufficiency of compliance with 3.1.15.2.(1)	205/00
3.2.1.1.	Div. B 3.2.1.1.	02-28-883	2002	26-Sep-02	Determine whether the elevated floor assembly having an area of 563.5 m2 in a Group F, Division 2 building is considered to be a mezzanine which must comply with the provisions of s 3.2.2.67.(2)(c) and (d) or whether it can be considered a service platform in conformance with the provisions of 3.2.1.1.(8)	283/01

3.2.1.1.	Div. B 3.2.1.1.	99-60-716	1999	23-Sep-99	Determine whether the proposed new arena built adjoining to the existing retail mall as one, albeit expanded, building constructed on two properties complies with 3.2.3.4. of the Ontario Building Code (OBC), and if so, whether the proposed design, without the provision of a fire separation with a two hour fire resistance rating complete with closures or special interconnected floor space fire safety measures, provides sufficiency of compliance with 3.2.8.1.(1)	278/99
3.2.1.1.	Div. B 3.2.1.1.	01-04-797	2001	8-Feb-01	Determine whether the proposed mezzanine, upper mezzanine and grid iron areas intended for a live performance teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with 3.2.2.24., s 3.2.1.1.(3),(4) and (5), 3.2.8.2.(1), 3.4.2.2. and 3.4.2.5.(1)(c)	205/00
3.2.1.1.	Div. B 3.2.1.1.	02-43-898	2002	12-Dec-02	Determine whether the viewing walkway, having an area of 207 m2, is a mezzanine which provides sufficiency of compliance with s 3.2.1.1.(4), 3.3.1.5.(2), (3) and (4) of the Ontario Building Code or whether it is considered to be a storey which must be meet the construction requirements for a storey in a building having a Group F, Division 3 occupancy classification	283/01

3.2.2.4.	Div. B 3.2.2.4.	01-59-852	2001	6-Dec-01	Determine whether the proposed 56.6 m2 addition to an existing multiple occupancy (A2 and C) building, which is intended to be unsprinklered and constructed using combustible construction, provides sufficiency of compliance with s 3.2.2.4.(2), 3.2.2.5.(1), 3.2.2.6.(1), 3.2.2.24. and 11.2.1.2.(1)	283/01

3.2.2.5.	Div. B 3.2.2.5.	01-59-852	2001	6-Dec-01	Determine whether the proposed 56.6 m2 addition to an existing multiple occupancy (A2 and C) building, which is intended to be unsprinklered and constructed using combustible construction, provides sufficiency of compliance with s 3.2.2.4.(2), 3.2.2.5.(1), 3.2.2.6.(1), 3.2.2.24. and 11.2.1.2.(1)	283/01

3.2.2.6.	Div. B 3.2.2.6.	01-59-852	2001	6-Dec-01	Determine whether the proposed 56.6 m2 addition to an existing multiple occupancy (A2 and C) building, which is intended to be unsprinklered and constructed using combustible construction, provides sufficiency of compliance with s 3.2.2.4.(2), 3.2.2.5.(1), 3.2.2.6.(1), 3.2.2.24. and 11.2.1.2.(1)	283/01

3.2.2.6.	Div. B 3.2.2.6.	01-53-846	2001	25-Oct-01	Determine whether the ground floor amenity space (exercise room, swimming pool, change room and lounge), that is not proposed to be sprinklered, in a building containing a Group C major occupancy, provides sufficiency of compliance with s 3.2.2.6., 3.2.2.23. and s 3.2.2.7.(1) and 3.2.2.8.(1)	283/01

3.2.2.7.	Div. B 3.2.2.7.	01-53-846	2001	25-Oct-01	Determine whether the ground floor amenity space (exercise room, swimming pool, change room and lounge), that is not proposed to be sprinklered, in a building containing a Group C major occupancy, provides sufficiency of compliance with s 3.2.2.6., 3.2.2.23. and s 3.2.2.7.(1) and 3.2.2.8.(1)	283/01

3.2.2.8.	Div. B 3.2.2.8.	01-53-846	2001	25-Oct-01	Determine whether the ground floor amenity space (exercise room, swimming pool, change room and lounge), that is not proposed to be sprinklered, in a building containing a Group C major occupancy, provides sufficiency of compliance with s 3.2.2.6., 3.2.2.23. and s 3.2.2.7.(1) and 3.2.2.8.(1)	283/01

3.2.2.9.	Div. B 3.2.2.9.	02-13-868	2002	23-May-02	Determine whether the proposed additions that include crawl space areas which contain mechanical rooms housing HVAC equipment venting to the exterior is permitted to be governed by the construction requirements of 3.2.2.28.	283/01
3.2.2.9.	Div. B 3.2.2.9.	02-26-881	2002	12-Sep-02	Determine whether the subsurface (future basement) level of a proposed research facility, which will be unoccupied, unsprinklered and provided with limited access until such time as a use for the area has been determined, provides sufficiency of compliance with s 3.2.2.9.(1) and 3.4.2.1.(1) and s 3.2.2.52. and 3.2.2.77	283/01

3.2.2.10.	Div. B 3.2.2.10.	00-36-768	2000	27-Jul-00	Determine whether the new sprinklered facility separated from an existing building by a firewall, but which is proposed to be constructed without facing a street for fire fighting purposes or a fire access route, provides sufficiency of compliance with s 3.2.2.10.(1) and (2), 3.2.5.4.(1), and 3.2.5.5.	205/00

3.2.2.16.	Div. B 3.2.2.16.	02-22-877	2002	1-Aug-02	Determine whether the proposed natural gas fireplaces to be located in the Fireplace Lounges, which constitute extensions of public corridors leading to exits in sites 1 and 3, provide sufficiency of compliance with 3.3.1.2.(3), and whether the proposed use of glued-laminated heavy timber beams and purlins as well as plywood sheathing for attachment of copper roofing in the construction of the roof assembly of the fireplace lounge in site 3, provides sufficiency of compliance with s 3.2.2.43.(2), 3.2.2.16.(1) and 3.1.5.3.(2)	283/01

3.2.2.17.	Div. B 3.2.2.17.	99-29-685	1999	29-Apr-99	Determine whether the proposed sprinkler system to be installed throughout the North Infill portion of the subject building compensates for the lack of a rated roof assembly provided for the North Infill area thereby providing sufficiency of compliance with 3.2.2.17., and whether the proposed hold-open devices at the eight doors between the North Infill, the North Wing and the Link area comply with 3.1.8.12.	122/98

3.2.2.23	Div. B 3.2.2.23	01-53-846	2001	25-Oct-01	Determine whether the ground floor amenity space (exercise room, swimming pool, change room and lounge), that is not proposed to be sprinklered, in a building containing a Group C major occupancy, provides sufficiency of compliance with s 3.2.2.6., 3.2.2.23. and s 3.2.2.7.(1) and 3.2.2.8.(1)	283/01

3.2.2.24.	Div. B 3.2.2.23	01-59-852	2001	6-Dec-01	Determine whether the proposed 56.6 m2 addition to an existing multiple occupancy (A2 and C) building, which is intended to be unsprinklered and constructed using combustible construction, provides sufficiency of compliance with s 3.2.2.4.(2), 3.2.2.5.(1), 3.2.2.6.(1), 3.2.2.24. and 11.2.1.2.(1)	283/01
3.2.2.24.	Div. B 3.2.2.23	01-04-797	2001	8-Feb-01	Determine whether the proposed mezzanine, upper mezzanine and grid iron areas intended for a live performance teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with 3.2.2.24., s 3.2.1.1.(3),(4) and (5), 3.2.8.2.(1), 3.4.2.2. and 3.4.2.5.(1)(c)	205/00
3.2.2.24	Div. B 3.2.2.23	00-56-788	2000	16-Nov-00	Determine whether the proposed partition walls and corridor configuration provide sufficiency of compliance with s 3.1.5.12.(3), 3.2.2.24.(2), 3.3.1.1.(1), and 3.3.1.4.(3)	205/00
3.2.2.24.	Div. B 3.2.2.23	02-21-876	2002	1-Aug-02	Determine whether the proposed compensating measures offered in a building containing A2 and D occupancies and having exposing building faces with unprotected openings less than 10% of the exposing building face and which includes elements of combustible construction, provides sufficiency of compliance with 3.2.2.24. and 3.2.3.7.(1)	283/01

3.2.2.26.	Div. B 3.2.2.26	03-50-948	2003	20-Nov-03	Determine whether the proposed temporary air-supported structure, which has a Group A, Division 2 occupancy, that is not equipped with a sprinkler system or a standpipe and hose system, provides sufficiency of compliance with s 3.2.2.26. and 3.2.9.1., when considering 3.13.2.2.(3)	220/02

3.2.2.28.	Div. B 3.2.2.28.	02-13-868	2002	23-May-02	Determine whether the proposed additions that include crawl space areas which contain mechanical rooms housing HVAC equipment venting to the exterior is permitted to be governed by the construction requirements of 3.2.2.28.	283/01

3.2.2.35.	Div. B 3.2.2.35	03-07-905	2003	23-Jan-03	Determine whether the two proposed, unsprinklered grandstand buildings, which will include Group D and Group A, Division 2 occupancies beneath a Group A, Division 4 major occupancy, provide sufficiency of compliance with 3.2.2.35.(4)	283/01
3.2.2.35.	Div. B 3.2.2.35.	99-75-731	1999	9-Dec-99	Determine whether the noncombustible bleachers, with a calculated minimum fire-resistance rating of 1.36 hours, offered in lieu of sprinklering the spaces below, provides sufficiency of compliance with 3.2.2.35.(4)	278/99

3.2.2.37	Div. B 3.2.2.37	01-37-830	2001	16-Aug-01	Determine whether the proposed 82.15 m2 , unsprinklered classroom addition to the existing unsprinklered detention occupancy, provides sufficiency of compliance with 3.2.2.37	205/00

3.2.2.40.	Div. B 3.2.2.40.	01-23-816	2001	10-May-01	Determine whether the 72 m2 (775 ft2) addition to the existing unsprinklered care and treatment occupancy that is also proposed to be unsprinklered provides sufficiency of compliance with 3.2.2.40	205/00
3.2.2.40.	Div. B 3.2.2.40.	99-67-723	1999	4-Nov-99	Determine whether the proposed sprinkler system, designed according to NFPA 13R, and intended for use in a Group B, Division 3 occupancy provides sufficiency of compliance with 3.2.2.40. and 3.2.5.13.(1)	278/99
3.2.2.41	Div. B 3.2.2.40.	99-71-727	1999	2-Dec-99	Determine whether the proposed sprinkler system, designed according to NFPA 13R, provides sufficiency of compliance with 3.2.2.41. and s 3.2.5.13.(1) and (2)	278/99
3.2.2.41	Div. B 3.2.2.40.	99-52-708	1999	5-Aug-99	Determine whether the proposed sprinkler system, designed according to NFPA 13R, provides sufficiency of compliance with 3.2.2.41. and s 3.2.5.13.(1) and (2)	278/99
3.2.2.41	Div. B 3.2.2.40.	99-07-663	1999	27-Jan-99	Determine whether a sprinkler system constructed to the NFPA 13R standard achieves sufficiency of compliance with 3.2.2.41 and s 3.2.5.13.(1) and (2)	395/96
3.2.2.41	Div. B 3.2.2.40.	99-51-707	1999	5-Aug-99	Determine whether the proposed sprinkler system, designed according to NFPA 13R, provides sufficiency of compliance with 3.2.2.41. and s 3.2.5.13.(1) and (2)	278/99
3.2.2.41	Div. B 3.2.2.40.	99-06-662	1999	27-Jan-99	Determine whether a sprinkler system constructed to the NFPA 13R standard achieves sufficiency of compliance with 3.2.2.41 and s 3.2.5.13.(1) and (2)	395/96
3.2.2.41	Div. B 3.2.2.40.	98-41-646	1998	5-Nov-98	Determine whether a sprinkler system constructed to the NFPA 13R standard achieves sufficiency of compliance with 3.2.2.41 and s 3.2.5.13.(1) and 3.2.5.13.(2)	122/98

3.2.2.28.	Div. B 3.2.2.28.	02-13-868	2002	23-May-02	Determine whether the proposed additions that include crawl space areas which contain mechanical rooms housing HVAC equipment venting to the exterior is permitted to be governed by the construction requirements of 3.2.2.28.	283/01

3.2.2.43	Div. B 3.2.2.43	02-22-877	2002	1-Aug-02	Determine whether the proposed natural gas fireplaces to be located in the Fireplace Lounges, which constitute extensions of public corridors leading to exits in sites 1 and 3, provide sufficiency of compliance with 3.3.1.2.(3), and whether the proposed use of glued-laminated heavy timber beams and purlins as well as plywood sheathing for attachment of copper roofing in the construction of the roof assembly of the fireplace lounge in site 3, provides sufficiency of compliance with s 3.2.2.43.(2), 3.2.2.16.(1) and 3.1.5.3.(2)	283/01

3.2.2.45.	Div. B. 3.2.2.45.	06-05-1075		19-Jan-06	Whether the existing Group C residential condominium building consisting of a below grade parking garage and four levels of residential suites, where a close proximity sprinkler system is proposed to compensate for the deficient fire resistance rating of the exterior load bearing walls, provides sufficiency of compliance with Section 3.2.2.45.	

3.2.2.52.	Div. B 3.2.2.52.	02-26-881	2002	12-Sep-02	Determine whether the subsurface (future basement) level of a proposed research facility, which will be unoccupied, unsprinklered and provided with limited access until such time as a use for the area has been determined, provides sufficiency of compliance with s 3.2.2.9.(1) and 3.4.2.1.(1) and s 3.2.2.52. and 3.2.2.77	283/01

3.2.2.59	Div. B 3.2.2.59	99-19-675	1999	24-Mar-99	Determine whether the structure, with a proposed total building area of 1,508 m2, that is not equipped with a sprinkler system, provides sufficiency of compliance with 3.2.2.59	122/98

3.2.2.67	3.2.2.67.	05-07-1021		3-Feb-05	Determine whether the proposed automated storage and retrieval system that serves as structural support for the building in addition to support for the racking system components provides sufficiency of compliance with Article 3.2.2.67., Clause 3.4.2.5.(1)(c) and Sentence 3.4.4.1.(1)	220/02
3.2.2.67.	Div. B 3.2.2.67.	02-28-883	2002	26-Sep-02	Determine whether the elevated floor assembly having an area of 563.5 m2 in a Group F, Division 2 building is considered to be a mezzanine which must comply with the provisions of s 3.2.2.67.(2)(c) and (d) or whether it can be considered a service platform in conformance with the provisions of 3.2.1.1.(8)	283/01

3.2.2.75.	Div. B 3.2.2.75.	99-63-720	1999	21-Oct-99	Determine whether the proposed addition, currently being constructed with fire separations having a 45 minute fire-resistance rating and that will result in a completed structure with a total building area of 5,198.9 m2, provides sufficiency of compliance with 3.2.2.75.	278/99

3.2.2.77.	Div. B 3.2.2.77.	02-26-881	2002	12-Sep-02	Determine whether the subsurface (future basement) level of a proposed research facility, which will be unoccupied, unsprinklered and provided with limited access until such time as a use for the area has been determined, provides sufficiency of compliance with s 3.2.2.9.(1) and 3.4.2.1.(1) and s 3.2.2.52. and 3.2.2.77	283/01

3.2.3.1.	Div. B 3.2.3.1.	00-15-747	2000	29-Mar-00	Determine the applicability and/or compliance with s 3.2.8.1.(3) and 3.2.8.2.(6) of the Ontario Building Code (OBC) regarding the proposed main floor interconnected floor space, whether the proposed design of the second floor corridor complies with OBC 3.3.3.3.(1), and whether the proposed connection to the adjacent existing building provides sufficiency of compliance with OBC Subsection 3.1.10. or 3.2.3.1.(1)(b) and 3.2.3.7.(1)	597/99

3.2.3.	Div. B 3.2.3.	00-21-753	2000	11-May-00	Determine whether the new supermarket, proposed to be constructed adjoining to an existing retail mall as one enlarged building built on two properties complies with s 3.2.3.1.(8), 3.2.3.7.(4), 3.2.3.12.(1), 3.2.3.12.(3), 3.2.3.13.(3) and 3.3.1.4.(4)	205/00

3.2.3.4.		99-60-716	1999	23-Sep-99	Determine whether the proposed new arena built adjoining to the existing retail mall as one, albeit expanded, building constructed on two properties complies with 3.2.3.4. of the Ontario Building Code (OBC), and if so, whether the proposed design, without the provision of a fire separation with a two hour fire resistance rating complete with closures or special interconnected floor space fire safety measures, provides sufficiency of compliance with 3.2.8.1.(1)	278/99

3.2.3.7.(1)	Div. B 3.2.3.7.(1)	04-51-1006		17-Jan-05	Determine whether the proposed exterior wall system that incorporates foamed plastic insulation and exterior cladding in an exterior wall of a Group C (Part 3) major occupancy building provides sufficiency of compliance with Sentences 3.2.3.7.(1) and 3.1.5.11.(3)	
3.2.3.7.	Div. B 3.2.3.7.	02-21-876	2002	1-Aug-02	Determine whether the proposed compensating measures offered in a building containing A2 and D occupancies and having exposing building faces with unprotected openings less than 10% of the exposing building face and which includes elements of combustible construction, provides sufficiency of compliance with 3.2.2.24. and 3.2.3.7.(1)	283/01
3.2.3.7.	Div. B 3.2.3.7.	02-04-859	2002	16-Jul-02	Determine whether the proposed foam plastic insulation and metal cladding system provides sufficiency of compliance with s 3.2.3.7.(7) and (8) when considering s 3.1.11.7. (1) and (2)	283/01
3.2.3.7.	Div. B 3.2.3.7.	00-15-747	2000	29-Mar-00	Determine the applicability and/or compliance with s 3.2.8.1.(3) and 3.2.8.2.(6) of the Ontario Building Code (OBC) regarding the proposed main floor interconnected floor space, whether the proposed design of the second floor corridor complies with OBC 3.3.3.3.(1), and whether the proposed connection to the adjacent existing building provides sufficiency of compliance with OBC Subsection 3.1.10. or 3.2.3.1.(1)(b) and 3.2.3.7.(1)	597/99

3.2.3.12.	Div. B 3.2.3.13.	99-62-718	1999	21-Oct-99	Determine whether the definition of "exit" as set out in 1.1.3.2. and 3.4.4.1.(1)	99-62-718

3.2.3.13.	Div. B 3.2.3.14.	00-13-745	2000	5-Oct-00	Determine whether the proposed construction of exterior walls and location of windows provides sufficiency of compliance with 3.2.3.13	205/00

3.2.3.18.	Div. B 3.2.3.19	00-15-747	2000	29-Mar-00	Determine the applicability and/or compliance with s 3.2.8.1.(3) and 3.2.8.2.(6) of the Ontario Building Code (OBC) regarding the proposed main floor interconnected floor space, whether the proposed design of the second floor corridor complies with OBC 3.3.3.3.(1), and whether the proposed connection to the adjacent existing building provides sufficiency of compliance with OBC Subsection 3.1.10. or 3.2.3.1.(1)(b) and 3.2.3.7.(1)	597/99

3.2.4.3.	Div. B 3.2.4.3.	01-18-811	2001	12-Apr-01	Determine whether the four storey building, that is to contain a Group B, Division 3 occupancy on the first and second floors and a Group C occupancy on the third and fourth floors and that is proposed to be equipped with a single stage fire alarm system, complies with s 3.2.4.3.(1)(b), (c) and (e)	205/00
3.2.4.5.	Div. B 3.2.4.3.	99-16-672	1999	11-Mar-99	Determine whether the fire alarm pull stations, installed at a height of 900 mm in accordance with 3.7.1.5., provides sufficiency of compliance with 3.2.4.5.(1)	395/96
3.2.4.8.	Div. B 3.2.4.3.	00-39-771	2000	10-Aug-00	Determine whether the as-constructed building, which does not provide protection on a floor area with a barrier-free path of travel, which has a combustible canopy and which does not offer a separate heat detection system, provides sufficiency of compliance with 3.3.1.7., 3.1.5.22.(2) and 3.2.4.11.(2)(b) respectively	205/00
3.2.4.11.	Div. B 3.2.4.3.	00-39-771	2000	10-Aug-00	Determine whether the as-constructed building, which does not provide protection on a floor area with a barrier-free path of travel, which has a combustible canopy and which does not offer a separate heat detection system, provides sufficiency of compliance with 3.3.1.7., 3.1.5.22.(2) and 3.2.4.11.(2)(b) respectively	205/00
3.2.4.16.	Div. B 3.2.4.3.	00-39-771	2000	10-Aug-00	Determine whether the as-constructed building, which does not provide protection on a floor area with a barrier-free path of travel, which has a combustible canopy and which does not offer a separate heat detection system, provides sufficiency of compliance with 3.3.1.7., 3.1.5.22.(2) and 3.2.4.11.(2)(b) respectively	205/00
3.2.4.19	Div. B 3.2.4.3.	01-43-836	2001	28-Feb-01	Determine whether the direct supervision of patients at all times in lieu of providing visual signal devices where sound booths will be used provides sufficiency of compliance with s 3.2.4.19.(7) and 3.2.4.20.(1)	283/01
3.2.4.19.	Div. B 3.2.4.3.	02-34-889	2002	17-Oct-02	Determine whether the proposed use of Class B wiring for line isolator modules located inside a residential suite and designed to isolate a signal circuit during an alarm condition only, complies with 3.2.4.19.(10)	283/01

3.2.4.20.	Div. B 3.2.4.20.	02-16-871	2002	20-Jun-02	Determine whether the use of unlisted, alpha-numeric display devices forming part of the call station located in the nursing stations provides sufficiency of compliance with 3.2.4.20.(2)	283/01
3.2.4.20.	Div. B 3.2.4.20.	01-43-836	2001	28-Feb-01	Determine whether the direct supervision of patients at all times in lieu of providing visual signal devices where sound booths will be used provides sufficiency of compliance with s 3.2.4.19.(7) and 3.2.4.20.(1)	283/01
3.2.5.4.	Div. B 3.2.5.4.	00-36-768	2000	27-Jul-00	Determine whether the new sprinklered facility separated from an existing building by a firewall, but which is proposed to be constructed without facing a street for fire fighting purposes or a fire access route, provides sufficiency of compliance with s 3.2.2.10.(1) and (2), 3.2.5.4.(1), and 3.2.5.5.	205/00
3.2.5.5.	Div. B 3.2.5.5.	00-36-768	2000	27-Jul-00	Determine whether the new sprinklered facility separated from an existing building by a firewall, but which is proposed to be constructed without facing a street for fire fighting purposes or a fire access route, provides sufficiency of compliance with s 3.2.2.10.(1) and (2), 3.2.5.4.(1), and 3.2.5.5.	205/00
3.2.5.5.	Div. B 3.2.5.5.	01-01-794	2001	11-Jan-01	Determine whether the location of the existing hydrant proposed to serve the needs of the expanded school facility provides sufficiency of compliance with s 3.2.5.5.(2)(b) and (c)	205/00
3.2.5.7.(1) and 3.2.5.7.(2)	Div. B 3.2.5.7.(1) and (2)	04-55-1010		2-Dec-04	Determine whether the proposed location of a dry hydrant will provide sufficiency of compliance with Sentences 3.2.5.7.(1) and 3.2.5.7.(2) of the Ontario Building Code for a 929 m2 one storey sawmill	220/02
3.2.5.13.	Div. B 3.2.5.13.	99-71-727	1999	2-Dec-99	Determine whether the proposed sprinkler system, designed according to NFPA 13R, provides sufficiency of compliance with 3.2.2.41. and s 3.2.5.13.(1) and (2)	278/99
3.2.5.13	Div. B 3.2.5.13.	00-61-793	2000	14-Dec-00	Determine whether the main arena seating bowl, in particular the number of seats, row widths, vomitory and aisle width, exits and access to exits and the smoke protection system, designed based on NFPA 101, "Life Safety Code" and NFPA 92B "Smoke Management Systems in malls atria, and large areas," provides sufficiency of compliance with s 3.3.2.3, 3.3.2.4, 3.4.3.4, 3.1.8.1, and 3.2.5.13(1)	205/00
3.2.5.13.	Div. B 3.2.5.13.	99-52-708	1999	5-Aug-99	Determine whether the proposed sprinkler system, designed according to NFPA 13R, provides sufficiency of compliance with 3.2.2.41. and s 3.2.5.13.(1) and (2)	278/99
3.2.5.13.	Div. B 3.2.5.13.	99-07-663	1999	27-Jan-99	Determine whether a sprinkler system constructed to the NFPA 13R standard achieves sufficiency of compliance with 3.2.2.41 and s 3.2.5.13.(1) and (2)	395/96

3.2.5.13.	Div. B 3.2.5.13.	99-06-662	1999	27-Jan-99	Determine whether a sprinkler system constructed to the NFPA 13R standard achieves sufficiency of compliance with 3.2.2.41 and s 3.2.5.13.(1) and (2)	395/96
3.2.5.13.	Div. B 3.2.5.13.	01-36-829	2001	2-Aug-01	Determine whether the proposed sprinkler system, designed in conformance with NFPA 13, with the exception of the attic area which would conform to NFPA 13R (exempt from sprinklering), provides sufficiency of compliance with 3.2.5.13.(1)	205/00
3.2.5.13.	Div. B 3.2.5.13.	00-06-738	2000	17-Feb-00	Determine whether the proposed sprinklering of the residential portion of the new fire station (a facility not required to be sprinklered) with a sprinkler system designed in accordance with NFPA 13R provides sufficiency of compliance with 3.2.5.13.(1)	597/99
3.2.5.13.	Div. B 3.2.5.13.	99-63-719	1999	21-Oct-99	Determine whether the 1.4 m exterior canopy, which has not been provided with sprinkler protection for the area beneath the canopy, provides sufficiency of compliance with 3.2.5.13.(1)	395/96
3.2.5.13.	Div. B 3.2.5.13.	99-47-703	1999	8-Jul-99	Determine whether the bank vault interior, as constructed, without sprinkler protection in a building required to be sprinklered, provides sufficiency of compliance with 3.2.5.13.(1)	278/99
3.2.5.13.	Div. B 3.2.5.13.	00-02-734	2000	13-Jan-00	Determine whether the proposed sprinkler system, designed according to NFPA 13R, and intended for use in a Group B, Division 3 occupancy provides sufficiency of compliance with 3.2.2.40. and 3.2.5.13.(1	597/99
3.2.5.13	Div. B 3.2.5.13.	99-67-723	1999	4-Nov-99	Determine whether the proposed sprinkler system, designed according to NFPA 13R, and intended for use in a Group B, Division 3 occupancy provides sufficiency of compliance with 3.2.2.40. and 3.2.5.13.(1)	278/99
3.2.5.13.	Div. B 3.2.5.13.	99-51-707	1999	5-Aug-99	Determine whether the proposed sprinkler system, designed according to NFPA 13R, provides sufficiency of compliance with 3.2.2.41. and s 3.2.5.13.(1) and (2)	278/99
3.2.5.13.	Div. B 3.2.5.13.	98-41-646	1998	5-Nov-98	Determine whether a sprinkler system constructed to the NFPA 13R standard achieves sufficiency of compliance with 3.2.2.41 and s 3.2.5.13.(1) and 3.2.5.13.(2)	122/98

3.2.5.13.	Div. B 3.2.5.13.	01-14-807	2001	29-Mar-01	Determine whether the building's proposed power system, that includes two independent supply connections to two separate street substations and one on-site co-generation plant, offered in lieu of a power supply system conforming with 3.2.7.5. of the Ontario Building Code (OBC) provides sufficiency of compliance with s 3.2.7.4.(1) and 3.2.7.9.(4)	205/00
3.2.5.13.	Div. B 3.2.5.13.	01-16-809	2001	29-Mar-01	Determine whether the building's proposed power system, that includes two independent supply connections to two power supply system conforming with 3.2.7.5. of the Ontario Building Code (OBC) provides sufficiency of compliance with s 3.2.7.4.(1) and 3.2.7.9.(4)	205/00
3.2.7.1.	Div. B 3.2.7.1..	03-01-899	2003	16-Jan-03	Determine whether the egress lighting, which is not proposed to be illuminated for 24 hours of each day, complies with 3.2.7.1.(1)	283/01
3.2.7.3.	Div. B 3.2.7.3.	99-22-678	1999	8-Apr-99	Determine whether the proposed location of a fuel fired appliance and the proposed level of illumination of exit signage complies with s 3.6.2.1.(2) and 3.6.2.2.(3) and s 3.2.7.3.(1)(i) and (j) and 3.2.7.3.(3) respectively	122/98
3.2.7.4.	Div. B 3.2.7.4..	01-16-809	2001	29-Mar-01	Determine whether the building's proposed power system, that includes two independent supply connections to two power supply system conforming with 3.2.7.5. of the Ontario Building Code (OBC) provides sufficiency of compliance with s 3.2.7.4.(1) and 3.2.7.9.(4)	205/00
3.2.7.4.	Div. B 3.2.7.4.	01-14-807	2001	29-Mar-01	Determine whether the building's proposed power system, that includes two independent supply connections to two separate street substations and one on-site co-generation plant, offered in lieu of a power supply system conforming with 3.2.7.5. of the Ontario Building Code (OBC) provides sufficiency of compliance with s 3.2.7.4.(1) and 3.2.7.9.(4)	205/00
3.2.7.5.	Div. B 3.2.7.5.	01-16-809	2001	29-Mar-01	Determine whether the building's proposed power system, that includes two independent supply connections to two power supply system conforming with 3.2.7.5. of the Ontario Building Code (OBC) provides sufficiency of compliance with s 3.2.7.4.(1) and 3.2.7.9.(4)	205/00

3.2.7.5.	Div. B 3.2.7.5.	01-14-807	2001	29-Mar-01	Determine whether the building's proposed power system, that includes two independent supply connections to two separate street substations and one on-site co-generation plant, offered in lieu of a power supply system conforming with 3.2.7.5. of the Ontario Building Code (OBC) provides sufficiency of compliance with s 3.2.7.4.(1) and 3.2.7.9.(4)	205/00

3.2.7.9.	Div. B 3.2.7.9.	01-16-809	2001	29-Mar-01	Determine whether the building's proposed power system, that includes two independent supply connections to two power supply system conforming with 3.2.7.5. of the Ontario Building Code (OBC) provides sufficiency of compliance with s 3.2.7.4.(1) and 3.2.7.9.(4)	205/00
3.2.7.9.	Div. B 3.2.7.9.	01-14-807	2001	29-Mar-01	Determine whether the building's proposed power system, that includes two independent supply connections to two separate street substations and one on-site co-generation plant, offered in lieu of a power supply system conforming with 3.2.7.5. of the Ontario Building Code (OBC) provides sufficiency of compliance with s 3.2.7.4.(1) and 3.2.7.9.(4)	205/00

3.2.8.1.	Div. B 3.2.8.1.	00-19-751	2000	27-Apr-00	to determine; (1) whether the proposed second storey partitions located in the interconnected floor space between the first and second floors complies with 3.2.8.1.(5) of the Ontario Building Code (OBC), (2) whether the proposed second and third floor travel distances provide sufficiency of compliance with 3.4.2.5.(1)(c) and 3.3.2.5.(4), (3) whether the building should be considered as having one or two suites and thereby provide either a 30 minute or one hour separation as per s 3.3.2.2.(8) or 3.3.1.1.(1), (4) whether the proposed close-spaced sprinklers on both sides of the unrated fire separations on the first floor provide sufficiency of compliance with either s 3.3.2.2.(8) or 3.3.1.1.(1), and (5) whether the proposed installation of a sprinkler activated mechanical exhaust system in lieu of roof mounted gravity vents provides sufficiency of compliance with 3.3.2.12.(5)	597/99
3.2.8.1.	Div. B 3.2.8.1.	99-60-716	1999	23-Sep-99	Determine whether the proposed new arena built adjoining to the existing retail mall as one, albeit expanded, building constructed on two properties complies with 3.2.3.4. of the Ontario Building Code (OBC), and if so, whether the proposed design, without the provision of a fire separation with a two hour fire resistance rating complete with closures or special interconnected floor space fire safety measures, provides sufficiency of compliance with 3.2.8.1.(1)	278/99

3.2.8.2.	Div. B 3.2.8.2.	02-15-870	2002	6-Jun-02	Determine whether the 6.75 m2 light well opening interconnecting Levels 3, 4 and 5 and which does not include a stairway, escalator or moving walkway, but will be equipped with additional fire safety features, provides sufficiency of compliance with s 3.2.8.2.(5) and (6)	283/01
3.2.8.2.	Div. B 3.2.8.2.	01-04-797	2001	8-Feb-01	Determine whether the proposed mezzanine, upper mezzanine and grid iron areas intended for a live performance teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with 3.2.2.24., s 3.2.1.1.(3),(4) and (5), 3.2.8.2.(1), 3.4.2.2. and 3.4.2.5.(1)(c)	205/00
3.2.8.2.	Div. B 3.2.8.2.	00-15-747	2000	29-Mar-00	Determine the applicability and/or compliance with s 3.2.8.1.(3) and 3.2.8.2.(6) of the Ontario Building Code (OBC) regarding the proposed main floor interconnected floor space, whether the proposed design of the second floor corridor complies with OBC 3.3.3.3.(1), and whether the proposed connection to the adjacent existing building provides sufficiency of compliance with OBC Subsection 3.1.10. or 3.2.3.1.(1)(b) and 3.2.3.7.(1)	597/99

3.2.8.4.	Div. B 3.2.8.4.	00-22-754	2000	18-May-00	Determine whether the 45 m travel distances in the existing portions of the building, which are not to be protected by a 2 hour rated wall at the proposed atrium, provide sufficiency of compliance with 3.2.8.4.(4)	205/00
3.2.8.4.	Div. B 3.2.8.4.	99-31-687	1999	13-May-99	Determine whether the travel distances on the second to fifth floors ranging from 53 to 56 m, in a structure with interconnected floor space due to the full height atrium, provides sufficiency of compliance with 3.2.8.4.(4) and 3.4.2.5.(1)(b)	122/98

3.2.9.1.	3.2.9.1.	04-53-1008		18-Nov-04	Determine whether the proposed 6,524 m2 addition to an existing 5,870 m2 steel shearing and warehouse facility that has been designed without a standpipe and hose system provides sufficiency of compliance with Article 3.2.9.1.	220/02
3.2.9.1.	Div. B 3.2.9.1.	01-31-824	2001	5-Jul-01	Determine whether the enlarged manufacturing and warehouse facility with a total building area of 27, 221 m2 that is not equipped with a standpipe and hose system provides sufficiency of compliance with 3.2.9.1.	205/00
3.2.9.1.	Div. B 3.2.9.1.	03-50-948	2003	20-Nov-03	Determine whether the proposed temporary air-supported structure, which has a Group A, Division 2 occupancy, that is not equipped with a sprinkler system or a standpipe and hose system, provides sufficiency of compliance with s 3.2.2.26. and 3.2.9.1., when considering 3.13.2.2.(3)	220/02

3.2.9.1.	Div. B 3.2.9.1.	01-30-823	2001	5-Jun-01	Determine whether the as-constructed infill addition that joins together two previously separate structures thereby creating a building having an area of 2, 229 m2 (23,984 ft2), and that is not equipped with a standpipe and hose system, provides sufficiency of compliance with 3.2.9.1.	205/00
3.2.9.1.	Div. B 3.2.9.1.	00-41-773	2000	24-Aug-00	Determine whether the specified compensating measures, offered in lieu of a standpipe and hose system, provide sufficiency of compliance with 3.2.9.1.	205/00
3.2.9.1.	Div. B 3.2.9.1.	99-60-716a	1999	22-Apr-99	Determine whether the proposed expanded steel manufacturing facility with a total building area of 22,135 m2 (238,267 ft2), that is not equipped with a standpipe and hose system, provides sufficiency of compliance with 3.2.9.1	122/98
3.2.9.1.	Div. B 3.2.9.1.	98-50-655	1998	15-Dec-98	Determine whether the proposed steel shearing and warehouse facility, with an area of 5,870.68 m2, that is not equipped with a standpipe and hose system, provides sufficiency of compliance with 3.2.9.1.	122/98
3.2.9.1.	Div. B 3.2.9.1.	98-48-653	1998	15-Dec-98	Determine whether the natural and mechanical ventilation systems, as constructed, provide sufficiency of compliance with Subsections 9.32.2. and 9.32.3. respectively	122/98
3.2.9.1.	Div. B 3.2.9.1.	01-51-844	2001	25-Oct-01	Determine whether the compensating measures offered in lieu of standpipe and hose systems in buildings containing Group F, Division 2, Group F, Division 3 and Group D occupancies provide sufficiency of compliance with 3.2.9.1.(1)	283/01
3.2.9.1.	Div. B 3.2.9.1.	00-16-748	2000	13-Apr-00	Determine whether the various proposed compensating construction measures, offered in lieu of a standpipe and hose system, provide sufficiency of compliance with 3.2.9.1.(1	205/00
3.2.9.1.	Div. B 3.2.9.1.	00-04-736	2000	3-Feb-00	Determine whether the church, proposed without a standpipe and hose system, but with a dome measuring approximately 18.3 m in height to the ceiling, provides sufficiency of compliance with 3.2.9.1.(1)	597/99

3.3.1.1.	3.3.1.1.	05-34-1048		4-Aug-05	Determine whether the proposed metal screen storage cubicles with wire-mesh roofs in a self-service storage facility located in the basement of a multiple occupancy building provides sufficiency of compliance with Articles 3.3.1.1. and 3.3.1.4., when considering Article 3.3.4.3.	
3.3.1.1.	3.3.1.1.	05-04-1018		20-Jan-05	Determine whether the as-constructed demising walls between Unit 18 and 18A and between Unit 18/Unit 18A and Unit 15 in the one storey portion Group E retail plaza, with Group D business and personal service occupancies, provides sufficiency of compliance with Article 3.3.1.1.	220/02
3.3.1.1.	Div. B 3.3.1.1.	00-56-788	2000	16-Nov-00	Determine whether the proposed partition walls and corridor configuration provide sufficiency of compliance with s 3.1.5.12.(3), 3.2.2.24.(2), 3.3.1.1.(1), and 3.3.1.4.(3)	205/00

3.3.1.1.	Div. B 3.3.1.1.	00-19-751	2000	27-Apr-00	to determine; (1) whether the proposed second storey partitions located in the interconnected floor space between the first and second floors complies with 3.2.8.1.(5) of the Ontario Building Code (OBC), (2) whether the proposed second and third floor travel distances provide sufficiency of compliance with 3.4.2.5.(1)(c) and 3.3.2.5.(4), (3) whether the building should be considered as having one or two suites and thereby provide either a 30 minute or one hour separation as per s 3.3.2.2.(8) or 3.3.1.1.(1), (4) whether the proposed close-spaced sprinklers on both sides of the unrated fire separations on the first floor provide sufficiency of compliance with either s 3.3.2.2.(8) or 3.3.1.1.(1), and (5) whether the proposed installation of a sprinkler activated mechanical exhaust system in lieu of roof mounted gravity vents provides sufficiency of compliance with 3.3.2.12.(5)	597/99

3.3.1.2	Div. B 3.3.1.2	99-39-695	1999	3-Jun-99	Determine whether the proposed communal gas-fired fireplace located in a lounge area open to the building's internal corridor system complies with 3.3.1.2.(3)	278/99
3.3.1.2.	Div. B 3.3.1.2	02-41-896	2002	4-Dec-02	Determine whether the as-installed natural gas fireplace that is located in the main lobby of a children's learning centre provides sufficiency of compliance with 3.3.1.2.(3)	283/01
3.3.1.2.	Div. B 3.3.1.2	02-22-877	2002	1-Aug-02	Determine whether the proposed natural gas fireplaces to be located in the Fireplace Lounges, which constitute extensions of public corridors leading to exits in sites 1 and 3, provide sufficiency of compliance with 3.3.1.2.(3), and whether the proposed use of glued-laminated heavy timber beams and purlins as well as plywood sheathing for attachment of copper roofing in the construction of the roof assembly of the fireplace lounge in site 3, provides sufficiency of compliance with s 3.2.2.43.(2), 3.2.2.16.(1) and 3.1.5.3.(2)	283/01

3.3.1.3.	Div. B 3.3.1.3.	99-14-670	1999	11-Mar-99	Determine whether the proposed laboratory and office tenancies should be considered separate suites, and would therefore be required to provide a doorway into a public corridor and to provide a fire separation between the corridor and the suites, including between the second floor corridor and the atrium, in accordance with 3.3.1.3.(8) and 3.3.1.4. respectively	122/98
3.3.1.3.	Div. B 3.3.1.3.	99-13-669	1999	24-Feb-99	Determine whether the proposed single exit public corridor serving two suites, each having access to a second exit, provides sufficiency of compliance with 3.3.1.3.(9)	122/98

3.3.1.4.	3.3.1.4.	05-34-1048		4-Aug-05	Determine whether the proposed metal screen storage cubicles with wire-mesh roofs in a self-service storage facility located in the basement of a multiple occupancy building provides sufficiency of compliance with Articles 3.3.1.1. and 3.3.1.4., when considering Article 3.3.4.3.	
3.3.1.4.	Div. B 3.3.1.4.	99-14-670	1999	11-Mar-99	Determine whether the proposed laboratory and office tenancies should be considered separate suites, and would therefore be required to provide a doorway into a public corridor and to provide a fire separation between the corridor and the suites, including between the second floor corridor and the atrium, in accordance with 3.3.1.3.(8) and 3.3.1.4. respectively	122/98
3.3.1.4.	Div. B 3.3.1.4.	00-56-788	2000	16-Nov-00	Determine whether the proposed partition walls and corridor configuration provide sufficiency of compliance with s 3.1.5.12.(3), 3.2.2.24.(2), 3.3.1.1.(1), and 3.3.1.4.(3)	205/00
3.3.1.4.	Div. B 3.3.1.4.	00-56-788	2000	16-Nov-00	Determine whether the proposed partition walls and corridor configuration provide sufficiency of compliance with s 3.1.5.12.(3), 3.2.2.24.(2), 3.3.1.1.(1), and 3.3.1.4.(3)	205/00
3.3.1.5.	Div. B 3.3.1.5.	02-43-898	2002	12-Dec-02	Determine whether the viewing walkway, having an area of 207 m2, is a mezzanine which provides sufficiency of compliance with s 3.2.1.1.(4), 3.3.1.5.(2), (3) and (4) of the Ontario Building Code or whether it is considered to be a storey which must be meet the construction requirements for a storey in a building having a Group F, Division 3 occupancy classification	3.3.1.5.
3.3.1.5.	Div. B 3.3.1.5.	99-66-722	1999	4-Nov-99	Determine whether the second storey sound and lighting booth, as constructed, with a pull-down ladder and a lockable access hatch provides sufficiency of compliance with 3.4.1.1. and 3.3.1.5	278/99
3.3.1.7	Div. B 3.3.1.7	00-39-771	2000	10-Aug-00	Determine whether the as-constructed building, which does not provide protection on a floor area with a barrier-free path of travel, which has a combustible canopy and which does not offer a separate heat detection system, provides sufficiency of compliance with 3.3.1.7., 3.1.5.22.(2) and 3.2.4.11.(2)(b) respectively	205/00
3.3.1.8.	Div. B 3.3.1.8.	01-22-815	2001	10-May-01	Determine whether the proposed construction of a new mezzanine (in an existing building), that is to have a minimum headroom clearance of 1,975 mm (6', 6") under the open web steel joists located at 1,975 mm (6', 6") on centre, provides sufficiency of compliance with s 3.3.1.8. and 3.4.3.6.	205/00
3.3.1.10.	Div. B 3.3.1.10.	00-09-741	2000	2-Mar-00	Determine whether the as-installed roll down security door that is closed only during non-business hours provides sufficiency of compliance with s 3.3.1.10.(1) and 3.3.1.12.(2	597/99

3.3.1.10.	Div. B 3.3.1.10.	00-09-741	2000	2-Mar-00	Determine whether the as-installed roll down security door that is closed only during non-business hours provides sufficiency of compliance with s 3.3.1.10.(1) and 3.3.1.12.(2	597/99
3.3.1.10.	Div. B 3.3.1.10.	02-07-862	2002	14-Feb-02	Determine whether the proposed inward swinging double doors would provide sufficiency of compliance with 3.3.1.10.(2)(a) when considering Subsection 3.1.16.	283/01
3.3.1.11.	Div. B 3.3.1.11.	99-04-660	1999	14-Jan-99	Determine whether the movable wall partitions installed as store fronts in numerous business occupancies, and located in their only means of egress, provides sufficiency of compliance with 3.3.1.11.(3)	122/98
3.3.1.12.	Div. B 3.3.1.12.	00-09-741	2000	2-Mar-00	Determine whether the as-installed roll down security door that is closed only during non-business hours provides sufficiency of compliance with s 3.3.1.10.(1) and 3.3.1.12.(2	597/99
3.3.1.15.	Div. B 3.3.1.15.	00-25-757	2000	25-May-00	Determine whether the eighteen sets of as-built spiral stairs, which are not required exit stairs and are measured at 780 mm in width and 50 mm and 160 mm in minimum and average tread depth respectively, are required to comply with 9.8.3.3.(2) and s 3.3.1.15 and 9.8.5.2	205/00
3.3.1.17.	Div. B 3.3.1.17.	01-38-831	2001	30-Aug-01	Determine whether the as-installed guard, surrounding a 3rd floor opening, and being 15 to 30 mm lower in height than the required 1,070 mm, provides sufficiency of compliance with 3.3.1.17.(1)	205/00
3.3.1.17.	Div. B 3.3.1.17.	00-29-761	2000	14-Jun-00	Determine whether the as-built handrail that projects 100 mm into the required 750 mm minimum width of a landing where a door swings into an exit stair complies with 3.4.3.5.(3	205/00
3.3.1.17.	Div. B 3.3.1.17.	00-01-733	2000	13-Jan-00	Determine whether the operation of the building compensates for the as-built guards constructed mainly with panels consisting of 50 by 50 mm welded wire mesh and thereby provides sufficiency of compliance with 3.3.1.17.(5)	597/99
3.3.1.17.	Div. B 3.3.1.17.	00-20-752	2000	11-May-00	Determine whether the as-built guards constructed mainly with panels consisting of 50 by 50 mm wire mesh provides sufficiency of compliance with s 3.3.1.17.(5) and 3.4.6.5.(8)	205/00

3.3.2.2.	Div. B 3.3.2.2.	00-19-751	2000	27-Apr-00	to determine; (1) whether the proposed second storey partitions located in the interconnected floor space between the first and second floors complies with 3.2.8.1.(5) of the Ontario Building Code (OBC), (2) whether the proposed second and third floor travel distances provide sufficiency of compliance with 3.4.2.5.(1)(c) and 3.3.2.5.(4), (3) whether the building should be considered as having one or two suites and thereby provide either a 30 minute or one hour separation as per s 3.3.2.2.(8) or 3.3.1.1.(1), (4) whether the proposed close-spaced sprinklers on both sides of the unrated fire separations on the first floor provide sufficiency of compliance with either s 3.3.2.2.(8) or 3.3.1.1.(1), and (5) whether the proposed installation of a sprinkler activated mechanical exhaust system in lieu of roof mounted gravity vents provides sufficiency of compliance with 3.3.2.12.(5)	597/99

3.3.2.3	Div. B 3.3.2.3.	05-23-1037		7-Jun-05	Determine whether the proposed main arena seating bowl, in particular the seat configuration, row width, vomitory and aisle widths, exit capacity/width, fire separation of main entry/exit “open stair”, designed in accordance with NFPA 101-2000, “Life Safety Code” and NFPA 92B, “Smoke Management Systems in Malls, Atria and Large Areas”, provides sufficiency of compliance with Articles 3.3.2.3., 3.3.2.4.. 3.4.3.4. and 3.4.4.1.	
3.3.2.3.	Div. B 3.3.2.3	00-61-793	2000	14-Dec-00	Determine whether the main arena seating bowl, in particular the number of seats, row widths, vomitory and aisle width, exits and access to exits and the smoke protection system, designed based on NFPA 101, "Life Safety Code" and NFPA 92B "Smoke Management Systems in malls atria, and large areas," provides sufficiency of compliance with s 3.3.2.3, 3.3.2.4, 3.4.3.4, 3.1.8.1, and 3.2.5.13(1)	205/00

3.3.2.4.	Div. B 3.3.2.4.	05-23-1037		7-Jun-05	Determine whether the proposed main arena seating bowl, in particular the seat configuration, row width, vomitory and aisle widths, exit capacity/width, fire separation of main entry/exit “open stair”, designed in accordance with NFPA 101-2000, “Life Safety Code” and NFPA 92B, “Smoke Management Systems in Malls, Atria and Large Areas”, provides sufficiency of compliance with Articles 3.3.2.3., 3.3.2.4.. 3.4.3.4. and 3.4.4.1.	
3.3.2.4	Div. B 3.3.2.4	00-61-793	2000	14-Dec-00	Determine whether the main arena seating bowl, in particular the number of seats, row widths, vomitory and aisle width, exits and access to exits and the smoke protection system, designed based on NFPA 101, "Life Safety Code" and NFPA 92B "Smoke Management Systems in malls atria, and large areas," provides sufficiency of compliance with s 3.3.2.3, 3.3.2.4, 3.4.3.4, 3.1.8.1, and 3.2.5.13(1)	205/00

3.3.2.5.	Div. B 3.3.2.5.	00-19-751	2000	27-Apr-00	to determine; (1) whether the proposed second storey partitions located in the interconnected floor space between the first and second floors complies with 3.2.8.1.(5) of the Ontario Building Code (OBC), (2) whether the proposed second and third floor travel distances provide sufficiency of compliance with 3.4.2.5.(1)(c) and 3.3.2.5.(4), (3) whether the building should be considered as having one or two suites and thereby provide either a 30 minute or one hour separation as per s 3.3.2.2.(8) or 3.3.1.1.(1), (4) whether the proposed close-spaced sprinklers on both sides of the unrated fire separations on the first floor provide sufficiency of compliance with either s 3.3.2.2.(8) or 3.3.1.1.(1), and (5) whether the proposed installation of a sprinkler activated mechanical exhaust system in lieu of roof mounted gravity vents provides sufficiency of compliance with 3.3.2.12.(5)	597/99

3.3.2.8.(1)(c)	Div. B 3.3.2.8.(1)(c)	04-32-987		22-Ju-04	Determine whether the omission of continuous guards between constructed rows of successive fixed seating provides sufficiency of compliance with Clause 3.3.2.8.(1)(c)	

3.3.2.12	Div. B 3.3.2.12	00-38-770	2000	10-Aug-00	Determine whether the proposed elevated platform should be considered a stage and must therefore comply with 3.3.2.12.	205/00
3.3.2.12.	Div. B 3.3.2.12	00-19-751	2000	27-Apr-00	to determine; (1) whether the proposed second storey partitions located in the interconnected floor space between the first and second floors complies with 3.2.8.1.(5) of the Ontario Building Code (OBC), (2) whether the proposed second and third floor travel distances provide sufficiency of compliance with 3.4.2.5.(1)(c) and 3.3.2.5.(4), (3) whether the building should be considered as having one or two suites and thereby provide either a 30 minute or one hour separation as per s 3.3.2.2.(8) or 3.3.1.1.(1), (4) whether the proposed close-spaced sprinklers on both sides of the unrated fire separations on the first floor provide sufficiency of compliance with either s 3.3.2.2.(8) or 3.3.1.1.(1), and (5) whether the proposed installation of a sprinkler activated mechanical exhaust system in lieu of roof mounted gravity vents provides sufficiency of compliance with 3.3.2.12.(5)	597/99
3.3.2.12	Div. B 3.3.2.12	00-38-770	2000	10-Aug-00	Determine whether the proposed elevated platform should be considered a stage and must therefore comply with 3.3.2.12.	205/00

3.3.2.13	. Div. B 3.3.2.13	99-46-702	1999	17-Jul-99	Determine whether the raised dining platform, as constructed, should be required to conform with s 3.3.2.13.(1) and 3.4.6.4.(7)	278/99

3.3.3.2.	Div. B 3.3.3.2.	00–47-779	2000	7-Sep-00	Determine whether the proposed renovation and conversion of an existing, detached building containing a Group C occupancy to a Group B, Division 3 care facility is required to comply with s 3.3.3.3.(3) and 3.3.3.4.(1), s 3.4.3.1.(2)(d), (c) and 3.8.3.3.(5)(b) and 3.3.3.2.(2)	205/00

3.3.3.3.	Div. B 3.3.3.3.	01-32-825	2001	5-Jul-01	Determine whether the proposed corridor design provides sufficiency of compliance with 3.3.3.3.(1)	205/00
3.3.3.3.	Div. B 3.3.3.3.	00-15-747	2000	29-Mar-00	Determine the applicability and/or compliance with s 3.2.8.1.(3) and 3.2.8.2.(6) of the Ontario Building Code (OBC) regarding the proposed main floor interconnected floor space, whether the proposed design of the second floor corridor complies with OBC 3.3.3.3.(1), and whether the proposed connection to the adjacent existing building provides sufficiency of compliance with OBC Subsection 3.1.10. or 3.2.3.1.(1)(b) and 3.2.3.7.(1)	597/99

3.3.3.3.	Div. B 3.3.3.3.	00–47-779	2000	7-Sep-00	Determine whether the proposed renovation and conversion of an existing, detached building containing a Group C occupancy to a Group B, Division 3 care facility is required to comply with s 3.3.3.3.(3) and 3.3.3.4.(1), s 3.4.3.1.(2)(d), (c) and 3.8.3.3.(5)(b) and 3.3.3.2.(2)	205/00
3.3.3.3.	Div. B 3.3.3.3.	99-40-696	1999	3-Jun-99	Determine whether the proposed residential-type ventilation system in the subject B 3 occupancy complies with 6.2.3.10.(5) of the Ontario Building Code (OBC) and whether the proposed 825 mm (2 ft 8 in) width of corridor doors intended for ambulatory users complies with 3.3.3.3.(4)	278/99
3.3.3.4.	Div. B 3.3.3.4.	00–47-779	2000	7-Sep-00	Determine whether the proposed renovation and conversion of an existing, detached building containing a Group C occupancy to a Group B, Division 3 care facility is required to comply with s 3.3.3.3.(3) and 3.3.3.4.(1), s 3.4.3.1.(2)(d), (c) and 3.8.3.3.(5)(b) and 3.3.3.2.(2)	205/00
3.3.5.6	Div. B 3.3.5.6.	04-04-1000		20-Dec-04	Determine whether the proposed compactor and scrap bin area in the basement level (former Eaton=s basement retail area) provides sufficiency of compliance with Articles 3.3.5.6 and 3.6.2.6	
3.3.5.6.	Div. B 3.3.5.6.	01-57-850	2001	8-Nov-01	Determine whether the “trucking area”(used for loading/unloading) in an industrial building is considered as a “storage garage” and therefore required to be separated from the adjacent warehouse area by a fire separation having a fire-resistance rating of 1.5 hours in accordance with 3.3.5.6	283/01
3.4.2.1.	Div. B 3.4.2.1.	99-50-706	1999	5-Aug-99	Determine whether the proposed fire alarm system for the entire building, offered in lieu of a required second exit from certain second storey units, provides sufficiency of compliance with 3.4.2.1.	278/99
3.4.2.2.	Div. B 3.4.2.2.	01-04-797	2001	8-Feb-01	Determine whether the proposed mezzanine, upper mezzanine and grid iron areas intended for a live performance teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with 3.2.2.24., s 3.2.1.1.(3),(4) and (5), 3.2.8.2.(1), 3.4.2.2. and 3.4.2.5.(1)(c)	205/00
3.4.2.2.	Div. B 3.4.2.2.	01-04-797	2001	8-Feb-01	Determine whether the proposed mezzanine, upper mezzanine and grid iron areas intended for a live performance teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with 3.2.2.24., s 3.2.1.1.(3),(4) and (5), 3.2.8.2.(1), 3.4.2.2. and 3.4.2.5.(1)(c)	205/00

3.4.2.5.	Div. B 3.4.2.5.	01-04-797	2001	8-Feb-01	Determine whether the proposed mezzanine, upper mezzanine and grid iron areas intended for a live performance teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with 3.2.2.24., s 3.2.1.1.(3),(4) and (5), 3.2.8.2.(1), 3.4.2.2. and 3.4.2.5.(1)(c)	205/00
3.4.2.5.	Div. B 3.4.2.5.	01-04-797	2001	8-Feb-01	Determine whether the proposed mezzanine, upper mezzanine and grid iron areas intended for a live performance teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with 3.2.2.24., s 3.2.1.1.(3),(4) and (5), 3.2.8.2.(1), 3.4.2.2. and 3.4.2.5.(1)(c)	205/00
3.4.2.5.	Div. B 3.4.2.5.	01-44-837	2001	27-Sep-01	Determine whether the distance from the rear of the dressing room area to an exit (in excess of 45 m) and the doors to the ice resurfacing room, that are not equipped with self-closing devices activated by a smoke detector, provide sufficiency of compliance with 3.4.2.5.(1)(c) and 3.1.8.12.(3)	205/00
3.4.2.5.	Div. B 3.4.2.5.	01-10-803	2001	15-Mar-01	Determine whether the proposed access to exit corridor, designed using a combination of the parameters outlined in 3.4.2.5.(1)(d) and 3.4.2.5.(2)	205/00
3.4.2.5.	Div. B 3.4.2.5.	00-19-751	2000	27-Apr-00	to determine; (1) whether the proposed second storey partitions located in the interconnected floor space between the first and second floors complies with 3.2.8.1.(5) of the Ontario Building Code (OBC), (2) whether the proposed second and third floor travel distances provide sufficiency of compliance with 3.4.2.5.(1)(c) and 3.3.2.5.(4), (3) whether the building should be considered as having one or two suites and thereby provide either a 30 minute or one hour separation as per s 3.3.2.2.(8) or 3.3.1.1.(1), (4) whether the proposed close-spaced sprinklers on both sides of the unrated fire separations on the first floor provide sufficiency of compliance with either s 3.3.2.2.(8) or 3.3.1.1.(1), and (5) whether the proposed installation of a sprinkler activated mechanical exhaust system in lieu of roof mounted gravity vents provides sufficiency of compliance with 3.3.2.12.(5)	597/99
3.4.2.5.	Div. B 3.4.2.5.	99-31-687	1999	13-May-99	Determine whether the travel distances on the second to fifth floors ranging from 53 to 56 m, in a structure with interconnected floor space due to the full height atrium, provides sufficiency of compliance with 3.2.8.4.(4) and 3.4.2.5.(1)(b)	122/98
3.4.2.5.	Div. B 3.4.2.5.	99-11-667	1999	24-Feb-99	Determine whether the intended smoke management system compensates for the proposed increase in travel distance and the elimination of a second exit to certain stores, thereby providing sufficiency of compliance with 3.4.2.5.(1)(d) and Sub 3.4.2.5.(1)(d)(iv) respectively	122/98

3.4.2.5.	Div. B 3.4.2.5.	01-45-838	2001	27-Sep-01	Determine whether the proposed main aisles in a Group F, Division 2 industrial building, which include several direction changes, lead through doors in interior partitions, and which lead to the exit doors located at 60 metre intervals around the perimeter of the building, provide sufficiency of compliance with 3.4.2.5.(2)	283/01
3.4.2.5.(1)(c)	Div. B 3.4.2.5.(1)(c)	05-07-1021		3-Feb-05	Determine whether the proposed automated storage and retrieval system that serves as structural support for the building in addition to support for the racking system components provides sufficiency of compliance with Article 3.2.2.67., Clause 3.4.2.5.(1)(c) and Sentence 3.4.4.1.(1)	

3.4.3.1.	Div. B 3.4.3.2	99-65-721	1999	4-Nov-99	Determine whether the stair lift, with a width of 1,220 mm when in operation, proposed to be located in an existing exit stair that is 1,675 mm wide provides sufficiency of compliance with 3.4.3.5.(1) and 3.4.3.1.(2)(b)	278/99
3.4.3.1.	Div. B 3.4.3.1. 3.4.3.2	00–47-779	2000	7-Sep-00	Determine whether the proposed renovation and conversion of an existing, detached building containing a Group C occupancy to a Group B, Division 3 care facility is required to comply with s 3.3.3.3.(3) and 3.3.3.4.(1), s 3.4.3.1.(2)(d), (c) and 3.8.3.3.(5)(b) and 3.3.3.2.(2)	205/00

3.4.3.4.	Div. B 3.4.3.2	05-23-1037		7-Ju-05	Determine whether the proposed main arena seating bowl, in particular the seat configuration, row width, vomitory and aisle widths, exit capacity/width, fire separation of main entry/exit “open stair”, designed in accordance with NFPA 101-2000, “Life Safety Code” and NFPA 92B, “Smoke Management Systems in Malls, Atria and Large Areas”, provides sufficiency of compliance with Articles 3.3.2.3., 3.3.2.4.. 3.4.3.4. and 3.4.4.1.	

3.4.3.4	Div. B 3.4.3.2	00-61-793	2000	14-Dec-00	Determine whether the main arena seating bowl, in particular the number of seats, row widths, vomitory and aisle width, exits and access to exits and the smoke protection system, designed based on NFPA 101, "Life Safety Code" and NFPA 92B "Smoke Management Systems in malls atria, and large areas," provides sufficiency of compliance with s 3.3.2.3, 3.3.2.4, 3.4.3.4, 3.1.8.1, and 3.2.5.13(1)	205/00

3.4.3.5.	Div. B 3.4.3.4	99-65-721	1999	4-Nov-99	Determine whether the stair lift, with a width of 1,220 mm when in operation, proposed to be located in an existing exit stair that is 1,675 mm wide provides sufficiency of compliance with 3.4.3.5.(1) and 3.4.3.1.(2)(b)	278/99
3.4.3.5.	Div. B 3.4.3.4	00-29-761	2000	14-Jun-00	Determine whether the as-built handrail that projects 100 mm into the required 750 mm minimum width of a landing where a door swings into an exit stair complies with 3.4.3.5.(3)	205/00

3.4.3.6.	Div. B 3.4.3.5.	01-22-815	2001	10-May-01	Determine whether the proposed construction of a new mezzanine (in an existing building), that is to have a minimum headroom clearance of 1,975 mm (6', 6") under the open web steel joists located at 1,975 mm (6', 6") on centre, provides sufficiency of compliance with s 3.3.1.8. and 3.4.3.6.	205/00

3.4.4.1.	Div. B 3.4.4.1.	05-23-1037		7-Jun-05	Determine whether the proposed main arena seating bowl, in particular the seat configuration, row width, vomitory and aisle widths, exit capacity/width, fire separation of main entry/exit “open stair”, designed in accordance with NFPA 101-2000, “Life Safety Code” and NFPA 92B, “Smoke Management Systems in Malls, Atria and Large Areas”, provides sufficiency of compliance with Articles 3.3.2.3., 3.3.2.4.. 3.4.3.4. and 3.4.4.1.	
3.4.4.1.	Div. B 3.4.4.1.	99-62-718	1999	21-Oct-99	Determine whether the definition of "exit" as set out in 1.1.3.2. and 3.4.4.1.(1)	99-62-718
3.4.4.1.(1)	Div. B 3.4.4.1.(1)	05-07-1021		3-Feb-05	Determine whether the proposed automated storage and retrieval system that serves as structural support for the building in addition to support for the racking system components provides sufficiency of compliance with Article 3.2.2.67., Clause 3.4.2.5.(1)(c) and Sentence 3.4.4.1.(1)	220/02
3.4.1.1.	Div. B 3.4.1.1.	99-66-722	1999	4-Nov-99	Determine whether the second storey sound and lighting booth, as constructed, with a pull-down ladder and a lockable access hatch provides sufficiency of compliance with 3.4.1.1. and 3.3.1.5	278/99

3.4.4.3.	Div. B 3.4.4.3.	99-62-718	1999	21-Oct-99	Determine whether the definition of "exit" as set out in 1.1.3.2. and 3.4.4.1.(1)	99-62-718

3.4.4.4.	Div. B 3.4.4.4.	01-35-828	2001	2-Aug-01	Determine whether the exit stair, which contains an opening for an elevator that is proposed to have a pressurized elevator shaft, provides sufficiency of compliance with 3.4.4.4.	205/00
3.4.4.4.	Div. B 3.4.4.4.	01-29-822	2001	21-Jun-01	Determine whether the retrofit elevator, installed to permit barrier-free accessibility throughout the existing two storey building, and proposed without separation in a lobby containing an exit stair, provides sufficiency of compliance with 3.4.4.4.(6)	205/00
3.4.4.4.	Div. B 3.4.4.4.	98-51-656	1998	15-Dec-98	Determine whether the proposed installation of a securitydesk in a lobby area leading to an exit provides sufficiency of compliance with 3.4.4.4.(6)	122/98

3.4.6.3.(2)	Div. B 3.4.6.3.(2)	04-33-988		5-Aug-04	Determine whether the as-constructed landing serving a flight of stairs in a Group A, Division 2 occupancy provides sufficiency of compliance with Sentence 3.4.6.3.(2)	

3.4.6.5.	Div. B 3.4.6.5.	00-20-752	2000	11-May-00	Determine whether the as-built guards constructed mainly with panels consisting of 50 by 50 mm wire mesh provides sufficiency of compliance with s 3.3.1.17.(5) and 3.4.6.5.(8)	205/00

3.4.6.7.	Div. B 3.4.6.7.	01-55-848	2001	8-Nov-01	Determine whether the as-constructed stairs that provide access to a mezzanine level in an industrial occupancy and having a minimum run of 229 mm (9 in), provide sufficiency of compliance with 3.4.6.7.(1)	283/01
3.4.6.15.	Div. B 3.4.6.15.	98-46-651	1998	3-Dec-98	Determine whether the proposed installation of Electroguard delayed access devices on certain exit doors provides sufficiency of compliance with 3.4.6.15.(4)	122/98
3.6.2.2.	Div. B 3.6.2.1 (9) & (10)	99-22-678	1999	8-Apr-99	Determine whether the proposed location of a fuel fired appliance and the proposed level of illumination of exit signage complies with s 3.6.2.1.(2) and 3.6.2.2.(3) and s 3.2.7.3.(1)(i) and (j) and 3.2.7.3.(3) respectively	122/98
3.6.2.6	Div. B 3.6.2.4.	04-04-1000		20-Dec-04	Determine whether the proposed compactor and scrap bin area in the basement level (former Eaton=s basement retail area) provides sufficiency of compliance with Articles 3.3.5.6 and 3.6.2.6	
3.6.3.1.	Div. B 3.6.3.1.	99-18-674	1999	24-Mar-99	Determine whether the fire separations not required to have a fire-resistance rating proposed to surround the vertical service shafts and to be constructed of 92 mm steel studs and 12.7 mm gypsum board and sealed at the perimeter and at all penetrations provides sufficiency of compliance with 3.6.3.1.(1)	122/98
3.6.3.3.	Div. B 3.6.3.3.	00-49-781	2000	21-Sep-00	Determine whether the linen chute, which is proposed to extend from the basement to the second floor only and not up and through the roof, provides sufficiency of compliance with 3.6.3.3.(3)	205/00
		99-16-672	1999	11-Mar-99	Determine whether the fire alarm pull stations, installed at a height of 900 mm in accordance with 3.7.1.5., provides sufficiency of compliance with 3.2.4.5.(1)	395/96
3.7.2.1.	Div. B 3.7.2.1.	01-11-804	2001	15-Mar-01	Determine whether the proposed design of the original Verona Suite plan, that includes a windowless, enclosed “study” room, complies with s 3.7.2.1.(1) and 9.7.1.2.(1	205/00
3.7.4.1.	Div. B 3.7.4.1.	00-44-776	2000	24-Aug-00	Determine whether the proposed substitution of two water closets with a proprietary composting toilet system to serve a one-classroom portable school with an adequate water supply provides sufficiency of compliance with 3.7.4.1.(2) and Part 8	205/00

3.7.4.1.	Div. B 3.7.4.1.	03-34-932	2003	28-Aug-03	Determine whether the proposed addition to a Group F, Division 3 occupancy that will not be equipped with water closets, but is located 250 metres away from an adjacent building on the same property that contains water closets, provides sufficiency of compliance with 3.7.4.1.(3)	220/02
3.7.4.3.	Div. B 3.7.4.3.	99-20-676	1999	8-Apr-99	Determine whether the proposed 83 m2 Pizza Nova Take Out franchise should be considered a mercantile occupancy and is therefore adequately served by a single unisex, barrier-free accessible washroom in accordance with 3.7.4.8.(3).	122/98
3.8.	Div. B 3.8.	02-27-882	2002	12-Sep-02	Determine whether the proposed retail kiosk, located in a mall corridor, is required to provide barrier-free accessibility in accordance with the provisions of s 3.8.1.3.(1) and 3.8.2.1.(1)	283/01
3.8.	Div. B 3.8.	02-20-875	2002	1-Aug-02	Determine whether the conversion of a century home into a six room inn, where no renovation to the existing entranceways is contemplated, is required to provide barrier-free access in accordance with 9.5.2.1.(1) and Section 3.8. when considering Part 11 and s 11.4.2.3.(1) and 11.4.3.4.(2)	283/01
3.8.1.1.	Div. B 3.8.1.1.	04-04-959		22-Jan-04	Determine whether the as-constructed Group C occupancy that is constructed as a three-storey residential house that includes a total of four separate suites, and which does not provide barrier-free access to the Ground Floor, complies with Article 3.8.1.1.	
3.8.1.1.	Div. B 3.8.1.1.	01-40-833	2001	30-Aug-01	Determine whether the proposed security gate house, that has not been designed for barrier-free access, provides sufficiency of compliance with s 9.5.2.1., 3.8.1.1., 3.8.1.2. and 3.8.2.3.	205/00
3.8.1.1.	Div. B 3.8.1.1.	01-20-813	2001	26-Apr-01	Determine whether the proposed seasonal-use sleeping cabins are required to be barrier-free accessible, when considering 9.5.2.1. and 3.8.1.1.(1)(c)	205/00
3.8.1.2.	Div. B 3.8.1.2.	01-40-833	2001	30-Aug-01	Determine whether the proposed security gate house, that has not been designed for barrier-free access, provides sufficiency of compliance with s 9.5.2.1., 3.8.1.1., 3.8.1.2. and 3.8.2.3.	205/00
3.8.1.3.	Div. B 3.8.1.3.	00-10-742	2000	2-Mar-00	Determine whether the proposed 3 m by 4.5 m kiosk structure, located in a 9 m wide public corridor, is required to provide barrier-free accessibility in accordance with s 3.8.1.3.(1) and 3.8.2.1.(1)	597/99

3.8.1.3.	Div. B 3.8.1.3.	99-32-688	1999	13-May-99	Determine whether the existing gravel floor is required to comply with s 4.1.1.3.(1) and 4.1.1.7.(1), 3.8.1.3., and s 3.8.2.1.(1) and 9.9.5.5.(2)	278/99

3.8.2.1.	Div. B 3.8.2.1.	99-32-688	1999	13-May-99	Determine whether the existing gravel floor is required to comply with s 4.1.1.3.(1) and 4.1.1.7.(1), 3.8.1.3., and s 3.8.2.1.(1) and 9.9.5.5.(2)	278/99
3.8.2.1.	Div. B 3.8.2.1.	00-10-742	2000	2-Mar-00	Determine whether the proposed 3 m by 4.5 m kiosk structure, located in a 9 m wide public corridor, is required to provide barrier-free accessibility in accordance with s 3.8.1.3.(1) and 3.8.2.1.(1)	597/99
3.8.2.1.	Div. B 3.8.2.1.	00-37-769	2000	27-Jul-00	Determine whether 3.8.2.1.(2)(k) of the Ontario Building Code, which permits an exemption from the requirement to provide barrier-free accessibility "within" residential suites, also applies to the design of the interior side of the egress doorways proposed for the units in the Sheraton Fallsview Hotel, Stanley Avenue and Livingstone Street, Niagara Falls, Ontario.	205/00
3.8.2.1.	Div. B 3.8.2.1.	00-17-749	2000	13-Apr-00	an application by Mr. Emanuel Vommero, owner, Vommero Enterprises, Niagara Falls, Ontario, for the resolution of a dispute with Mr. Mel Brown, Chief Building Official, City of Niagara Falls, Ontario, to interpret whether 3.8.2.1.(2)(k)	597/99
3.8.2.1.	Div. B 3.8.2.1.	99-02-658	1999	12-Jan-99	Determine whether the proposed dwelling unit balconies, which are not intended as areas of refuge, are required to be barrier-free when considering 3.8.2.1.(3)	122/98
3.8.2.1.	Div. B 3.8.2.1.	99-01-657	1999	12-Jan-99	Determine whether the proposed dwelling unit balconies, which are not intended as areas of refuge, are required to be barrier-free when considering 3.8.2.1.(3) of	122/98

3.8.2.3.	Div. B 3.8.2.3.	01-40-833	2001	30-Aug-01	Determine whether the proposed security gate house, that has not been designed for barrier-free access, provides sufficiency of compliance with s 9.5.2.1., 3.8.1.1., 3.8.1.2. and 3.8.2.3.	205/00
3.8.2.3.	Div. B 3.8.2.3.	99-59-715	1999	23-Sep-99	Determine whether the proposed change of use to a Group A, Division 2 (restaurant) occupancy, that is not provided with barrier-free a accessible washroom nor a separate washroom shared between employees only, is required to comply with s 3.8.2.3.(1) and 3.7.4.3.(7) respectively	278/99

3.8.3.3.	Div. B 3.8.3.3.	01-25-818	2001	10-Jun-01	Determine whether the as-installed paired corridor doors containing vision panels and which form part of the fire separation, are held open by magnetic hold open devices and are considered part of the barrier-free path of travel, provide sufficiency of compliance with 3.8.3.3.(14)	205/00
3.8.3.3.	Div. B 3.8.3.3.	03-22-920	2003	15-May-03	Determine whether 24 hour per day staffing at the subject group homes offered in lieu of automatic door openers provides sufficiency of compliance with 3.8.3.3.(5)	283/01
3.8.3.3.	Div. B 3.8.3.3.	00–47-779	2000	7-Sep-00	Determine whether the proposed renovation and conversion of an existing, detached building containing a Group C occupancy to a Group B, Division 3 care facility is required to comply with s 3.3.3.3.(3) and 3.3.3.4.(1), s 3.4.3.1.(2)(d), (c) and 3.8.3.3.(5)(b) and 3.3.3.2.(2)	205/00
3.8.3.3.	Div. B 3.8.3.3.	00-17-749	2000	13-Apr-00	an application by Mr. Emanuel Vommero, owner, Vommero Enterprises, Niagara Falls, Ontario, for the resolution of a dispute with Mr. Mel Brown, Chief Building Official, City of Niagara Falls, Ontario, to interpret whether 3.8.2.1.(2)(k)	597/99

3.8.3.4.	Div. B 3.8.3.4.	99-72-728	1999	2-Dec-99	Determine whether the as built guard, installed on the exterior barrier-free ramp with a maximum height of 865 mm and which includes a lower, parallel rail 660 mm above the ramp surface, provides sufficiency of compliance with Sub s 3.8.3.4.(1)(f)(i) and (ii) respectively	278/99

3.11.3.1.	Div. B	02-37-892	2002	7-Nov-02	Determine whether the compensating measures offered where the slope of the bottom of the pool exceeds 8% at a water depth of 1,350 mm or less, provide sufficiency of compliance with 3.11.3.1.(6)(a) and 3.11.3.1. (7)	283/01
3.11.3.1.	3.11.3.1.	02-37-892	2002	7-Nov-02	Determine whether the compensating measures offered where the slope of the bottom of the pool exceeds 8% at a water depth of 1,350 mm or less, provide sufficiency of compliance with 3.11.3.1.(6)(a) and 3.11.3.1. (7)	283/01

3.11.3.1.	Div. B 3.11.3.1.	02-02-857	2002	17-Jan-02	Determine whether the removal of the interior and exterior bridges, which form part of the continuous pool deck and facilitate the crossing of a 1752.6 mm (5 ft 9 in) portion of a seasonally divided pool, provides sufficiency of compliance with 3.11.3.1.(9)(a)	283/01
3.11.3.1.	Div. B 3.11.3.1.	99-38-694	1999	3-Jun-99	Determine whether the proposed pool deck width of 1,675 mm (5 ft 6 in) provides sufficiency of compliance with 3.11.3.1.(9)(a)	122/98

3.13.1.	Div. B 3.14.1.	05-01-1015		13-Jan-05	Determine whether the storage structure, referred to by the Applicant as a tent, provides sufficiency of compliance with Sentences 1.1.3.1.(1) and 2.1.1.3.(1), Subsection 3.13.1. and Sentence 9.1.1.4.(1)	220/02
3.13.2.2.	Div. B 3.14.2.2.	03-50-948	2003	20-Nov-03	Determine whether the proposed temporary air-supported structure, which has a Group A, Division 2 occupancy, that is not equipped with a sprinkler system or a standpipe and hose system, provides sufficiency of compliance with s 3.2.2.26. and 3.2.9.1., when considering 3.13.2.2.(3)	220/02
3.13.2.2.	Div. B 3.14.2.2.	03-50-948	2003	20-Nov-03	Determine whether the proposed temporary air-supported structure, which has a Group A, Division 2 occupancy, that is not equipped with a sprinkler system or a standpipe and hose system, provides sufficiency of compliance with s 3.2.2.26. and 3.2.9.1., when considering 3.13.2.2.(3)	220/02

PART 4

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
Part 4	Div. B Part 4	06-13-1083		23-Mar-06	Determine whether the proposed use of a composite lumber product, referred to as Life Long Decking System, for the exterior walking surface of the proposed deck serving a residential dwelling provides sufficiency of compliance with Parts 4 and 9	
4.1.1.3.(1)	Div. B 4.1.3.1.(1)	05-26-1040		7-Ju-05	Determine whether the proposed use of "Panelcraft™ Honeycomb Roof System" honeycomb sandwich panels in a sunroom provides sufficiency of compliance with Sentence 4.1.1.3.(1)	4.1.1.3.(1)
4.1.1.3.		99-32-688	1999	13-May-99	Determine whether the existing gravel floor is required to comply with s 4.1.1.3.(1) and 4.1.1.7.(1), 3.8.1.3., and s 3.8.2.1.(1) and 9.9.5.5.(2)	278/99
4.1.1.7.		99-32-688	1999	13-May-99	Determine whether the existing gravel floor is required to comply with s 4.1.1.3.(1) and 4.1.1.7.(1), 3.8.1.3., and s 3.8.2.1.(1) and 9.9.5.5.(2)	278/99
4.1.6.2.		99-42-698	1999	17-Jun-99	Determine whether the structural support system of the first floor of the temporary sales pavilion built to accommodate a live load of 2.4 kPa complies with 4.1.6.2.	278/99
4.1.7.3.		00-03-735	2000	1-Feb-00	Determine whether the proposed roof, designed to delay the run off of rainwater but which is engineered to support either snow or rain load but not both, complies with 4.1.7.3.(3)	597/99
4.1.10.1.	Div. B 4.1.5.15.	04-27-982		17-Jun-04	Determine whether the as-constructed exterior deck serving a Group C occupancy, which is comprised of a composite material referred to as "Life-Long Decking" that is manufactured by Brite Manufacturing Inc., will provide sufficiency of compliance with Articles 9.8.8.8. and 4.1.10.1.	220/02
4.1.10.1.	Div. B 4.1.5.15.	00-54-786	2000	2-Nov-00	Determine whether the proposed guard comprised mainly of 35 mm diameter acrylic rods complies with s 9.8.8.8. and 4.1.10.1. and whether the irregular curved stair provides sufficiency of compliance with 9.8.2.1.(1)	205/00

4.1.10.8.	Div. B 4.4.4.1.	02-05-860	2002	24-Jan-02	Determine whether the omission of a roof anchoring system, where window washing and maintenance is intended to be carried out from ladders with grade level access and where equipment is positioned to permit rooftop maintenance without approaching the parapet, provides sufficiency of compliance with 4.1.10.8	283/01

PART 6

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
6.2.3.2.	Div. B 6.2.3.2.	03-54-952	2003	4-Dec-03	Determine whether the as installed vertical exhaust shafts serving a residential high rise building which extend three storeys in height, and which are constructed using paper-lined gypsum shaftboard liners, comply with the intent of 6.2.3.2.(1) of the Ontario Building Code (OBC) or, in the alternative, whether these same shafts provide sufficiency of compliance with 6.2.3.2.(2)	220/02
6.2.3.2.	Div. B 6.2.3.2.	01-07-800	2001	15-Feb-01	Determine whether the proposed air distribution system that is comprised of under-slab combustible duct piping provides sufficiency of compliance with 6.2.3.2.	205/00
6.2.3.9.	Div. B 6.2.3.8.	00-28-760	2000	14-Jun-00	Determine whether the proposed installation of a single fan unit providing 24 L/s exhaust on a continuous basis to serve a bathroom with two fixtures requiring ventilation provides sufficiency of compliance with 6.2.3.9.(12)	205/00
6.2.3.10.	Div. B 6.2.3.9.	00–46-778	2000	7-Sep-00	Determine whether the ventilation and exhaust system that proposes to provide supply air from the corridors to the resident rooms and to exhaust from the resident washrooms provides sufficiency of compliance with 6.2.3.10.(3)	205/00
6.2.3.10.	Div. B 6.2.3.11.	99-40-696	1999	3-Jun-99	Determine whether the proposed residential-type ventilation system in the subject B 3 occupancy complies with 6.2.3.10.(5) of the Ontario Building Code (OBC) and whether the proposed 825 mm (2 ft 8 in) width of corridor doors intended for ambulatory users complies with 3.3.3.3.(4)	278/99

6.2.4.3.	Div. B 6.2.4.3.	02-36-891	2002	7-Nov-02	Determine whether the insulation used to wrap the attic duct work provides sufficiency of compliance with s 9.25.2.3.(1), 9.33.1.1.(1) and 6.2.4.3.(1) and whether the as-constructed wall assembly complies with the air barrier and vapour barrier requirements of 9.25.3.1.(1), 9.25.3.2.(1), 9.25.3.3.(1) and 9.25.4.1.(1) when considering s 5.4.1.1.(2) and 5.5.1.1.(2).	283/01

6.2.5.2.	Div. B 6.2.5.2.	01-08-801	2001	22-Feb-01	Determine whether the as-installed fuel fired appliances, a portion of each having been situated within 3 m of exterior walls of the same building which contain openings, provide sufficiency of compliance with 6.2.5.2.(1)(c)	205/00

PART 7

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
7.1.6.1.	Div. B 7.1.5.1.	00-26-758	2000	1-Jun-00	Determine whether proposed Class 1 (composting and incinerating toilet) and Class 2 (greywater system) systems in lieu of a Class 4 septic system to serve a newly built seasonal dwelling, complies with 8.1.2.1.(1) when considering s 7.1.6.1.(1) and 9.31.4.1.(1), and a subsequent proposal to include a different type of a Class 1 system (flush unit/composting toilet), a Class 2 system and a Class 3 system provides sufficiency of compliance with s 8.2.1.5.(1) and 8.2.1.4.(2)	205/00
7.1.6.4.	Div. B 7.1.5.4.	03-26-924	2003	19-Jun-03	Determine whether the proposed combined water main and combined sanitary main serving the two subject buildings provides sufficiency of compliance with 7.1.6.4.	220/02
7.1.6.4.	Div. B 7.1.5.4.	01-06-799	2001	15-Feb-01	Determine whether the proposed stacked townhouse units, with property lines occurring on both horizontal and vertical planes between them, comply with the requirements of s 9.10.11.1.(1), 7.1.6.4.(1) and 7.1.7.2.(1)	205/00
7.1.7.1.	Div. B 7.1.6.1.	99-10-666	1999	8-Apr-99	Determine whether the existing washroom ventilation and the fire stopping in the subject farm building provide comply with 7.1.7.1.(1) of the Ontario Building Code and 3.1.3.1.(1)	395/96
7.1.7.2.	Div. B 7.1.6.2.	01-06-799	2001	15-Feb-01	Determine whether the proposed stacked townhouse units, with property lines occurring on both horizontal and vertical planes between them, comply with the requirements of s 9.10.11.1.(1), 7.1.6.4.(1) and 7.1.7.2.(1)	205/00
7.2.2.5.	Div. B 7.2.2.6.	03-33-931	2003	28-Aug-03	Determine whether the as-installed fixture drainage outlets in the lavatories of a Group C occupancy comply with 7.2.2.5.(1)	220/02

7.2.5.1.	Div. B 7.2.5.1.	99-28-684	1999	29-Apr-99	Determine whether the fabricated asbestos cement pipe fittings comply with 7.2.5.1.	122/98
7.2.5.9.(1)	Div. B 7.2.5.10.	05-09-1023		19-Apr-05	Determine whether the proposed use of high density polyethylene pipe to convey sanitary sewage from a Group B, Division 2 care facility to the municipal sewer main provides sufficiency of compliance with Sentence 7.2.5.9.(1)	
7.4.6.3.	Div. B 7.4.6.3.	00-42-774	2000	24-Aug-00	Determine whether the asinstalled sanitary drainage system that includes a sump pit and pumps provides sufficiency of compliance with 7.4.6.3.	205/00
7.5.4.4.	Div. B 7.5.5.3.	00-07-739	2000	17-Feb-00	Determine whether the as-constructed acid vents serving plumbing fixtures of more than one laboratory room comply with 7.5.4.4.(1)	597/99
7.6.4.2.	Div. B 7.6.4.2.	01-09-802	2001	15-Mar-01	Determine whether the 13.25 litre water closets, proposed to be installed in the washrooms of the new hotel addition, provide sufficiency of compliance with 7.6.4.2.(3)	205/00

PART 8

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
Part 8	Part 8	05-45-1059		6-Oct-05	Determine whether the proposed home effluent pasteurization system provides sufficiency of compliance with Part 8 of	
8.1.2.1.	Div. B 8.1.2.1.	02-29-884	2002	3-Oct-02	Determine whether the as-installed Class 1 (composting toilet) and Class 2 (greywater pit) systems which serve a seasonal dwelling in lieu of a Class 4 system provide sufficiency of compliance with 8.1.2.1.(1)	283/01
8.1.2.1.	Div. B 8.1.2.1.	00-26-758	2000	1-Jun-00	Determine whether proposed Class 1 (composting and incinerating toilet) and Class 2 (greywater system) systems in lieu of a Class 4 septic system to serve a newly built seasonal dwelling, complies with 8.1.2.1.(1) when considering s 7.1.6.1.(1) and 9.31.4.1.(1), and a subsequent proposal to include a different type of a Class 1 system (flush unit/composting toilet), a Class 2 system and a Class 3 system provides sufficiency of compliance with s 8.2.1.5.(1) and 8.2.1.4.(2)	205/00
8.2.1.3.	Div. B 8.2.1.3.	99-34-690	1999	27-May-99	Determine whether the proposed expansion of the Class 4 sewage system based on current measured daily design sewage flow rates to serve an enlarged nursing home provides sufficiency of compliance with 8.2.1.3	278/99
8.2.1.3.	Div. B 8.2.1.3.	98-29-634	1998	29-Jul-98	Determine whether the existing sewage system with a working capacity of 6,819 Litres/day serving the proposed renovated house with a total finished area of 819.9 m2 provides sufficiency of compliance with s 8.2.1.3. and 8.2.2.3.	122/98
8.2.1.3.	Div. B 8.2.1.3.	02-31-886	2002	3-Oct-02	Determine whether the enlargement of the existing septic system to accommodate a proposed daily design flow rate of 8,000 L/day to service a warehouse addition provides sufficiency of compliance with 8.2.1.3.(2) and Table 8.2.1.3.B.	283/01
8.2.1.3.	Div. B 8.2.1.3.	01-17-810	2001	12-Apr-01	Determine whether the proposed self-service gas bar with a drive-through window, at 6783 Guelph Line, Part Lot 10, Concession 4 N.S., R.R. # 2, Milton, Ontario, should be considered as a "service station" in accordance with 8.2.1.3.(2) and Table 8.2.1.3.B.	205/00

8.2.1.3.	Div. B 8.2.1.3.	99-76-732	1999	16-Dec-99	Determine whether the type of occupancy, proposed as a drive through restaurant, is permitted to comply with 8.2.1.3.(4)	597/99
8.2.1.3.	Div. B 8.2.1.3.	01-19-812	2001	12-Apr-01	Determine whether the proposed Sobeys IGA supermarket that is to contain a delicatessen, a bakery, and a meat department is a listed occupancy under Table 8.2.1.3.B. (forming part of 8.2.1.3.(2)), or whether it is permitted to comply with 8.2.1.3.(4)	205/00

8.2.1.4.	Div. B 8.2.1.4.	05-10-1024		10-Mar-05	Determine whether the proposed Class 4 sewage system will provide sufficiency of compliance with Article 8.2.1.4., Sentences 8.2.1.6.(2), 8.7.4.2.(9) and Table 8.2.1.6.B	
8.2.1.4.	Div. B 8.2.1.4.	00-59-791	2000	7-Dec-00	Determine whether the construction of a deck, extending 2.13 m over a portion of an existing septic tank and the stairs serving the deck situated within 1.06 m of the existing filter bed, provide sufficiency of compliance with s 8.2.1.6.(1) and (2)	205/00

8.2.1.6. Table 8.2.1.6.B	Div. B 8.2.1.6. and Table 8.2.1.6. B	05-10-1024		10-Mar-05	Determine whether the proposed Class 4 sewage system will provide sufficiency of compliance with Article 8.2.1.4., Sentences 8.2.1.6.(2), 8.7.4.2.(9) and Table 8.2.1.6.B	
8.2.1.6.	Div. B 8.2.1.6.	00-59-791	2000	7-Dec-00	Determine whether the construction of a deck, extending 2.13 m over a portion of an existing septic tank and the stairs serving the deck situated within 1.06 m of the existing filter bed, provide sufficiency of compliance with s 8.2.1.6.(1) and (2)	205/00
8.2.1.6.	Div. B 8.2.1.6.	99-43-699	1999	24-Jun-99	Determine whether the deck, as constructed, with less than 1.5 m setback from the septic tank provides sufficiency of compliance with 8.2.1.6. and whether the proposed screened porch situated on the subject deck provides sufficiency of compliance with the same of the Ontario Building Code at 128 Greystone Drive, Carp, Ontario	278/99
8.2.1.6.	Div. B 8.2.1.6.	99-36-692	1999	27-May-99	Determine whether the new garage, proposed to be situated with a set back of 150mm from the holding tank, provides sufficiency of compliance with 8.2.1.6	122/98
8.2.1.6.	Div. B 8.2.1.6.	00-11-743	2000	16-Mar-00	Determine whether the as-constructed sewage system, with a clearance of only 0.76 m between the nearest point of the septic tank and the foundation wall of the building, provides sufficiency of compliance with 8.2.1.6.(1)	597/99
8.2.1.6.	Div. B 8.2.1.6.	01-42-835	2001	13-Sep-01	Determine whether the proposed sewage system with a portion of the distribution pipes located approximately 1 m to 2.2 m from the support posts of a proposed deck, provides sufficiency of compliance with 8.2.1.6.(2)	283/01
8.2.1.6.	Div. B 8.2.1.6.	99-49-705	1999	22-Jul-99	Determine whether the subject piers supporting a second storey balcony as constructed and first storey deck as proposed, with less than 5 m clearance distance to the sewage system distribution pipes, provides sufficiency of compliance with 8.2.1.6.(2)	122/98

8.2.1.6.	Div. B 8.2.1.6.	99-45-701	1999	24-Jun-99	Determine whether the proposed replacement of a failed Class 4 sewage system to be sited near the existing location with less than 30 m to two dug wells is required to comply with 8.2.1.6.(2)	278/99
8.2.1.6.	Div. B 8.2.1.6.	01-41-834	2001	13-Sep-01	Determine whether the as-installed holding tank, located approximately 7 m (20 ft) from an existing well, provides sufficiency of compliance with 8.2.1.6.(3) and Table 8.2.1.6.C.	205/00

8.2.2.3.	Div. B 8.2.2.3.	00-34-766	2000	13-Jul-00	Determine whether the working capacity of an existing gravity fed septic tank provides sufficiency of compliance with 8.2.2.3.(1)(a)	205/00
8.2.2.3.	Div. B 8.2.2.3.	98-29-634	1998	29-Jul-98	Determine whether the existing sewage system with a working capacity of 6,819 Litres/day serving the proposed renovated house with a total finished area of 819.9 m2 provides sufficiency of compliance with s 8.2.1.3. and 8.2.2.3.	122/98

8.4.1.2.	Div. B 8.4.1.2.	99-25-681	1999	15-Apr-99	Determine whether a pressurized water system used in conjunction with a Class 2 sewage system provides sufficiency of compliance with 8.4.1.2.(2)	122/98

8.4.2.2.	Div. B 8.4.2.2.	99-54-710	1999	19-Aug-99	Determine whether the proposed Class 1 and 2 sewage systems to serve a residential dwelling equipped with certain water conservation devices but with an estimated daily sanitary sewage flow of 2,700 litres per day provides sufficiency of compliance with 8.4.2.2.(1	278/99
8.6.2.2.	Div. B 8.4.2.2.	00-32-764	2000	13-Jun-00	Determine whether the as-built sewage system consisting of two consecutive 4,500 L septic tanks equipped with an effluent filter (and offered as primary and secondary treatment units) and an in-ground disposal bed at R.R. # 1 Petrolia, 5072 Petrolia Line, Petrolia, Ontario provides sufficiency of compliance with 8.6.2.2.	205/00
8.6.2.2.	Div. B 8.4.2.2.	00-33-765	2000	13-Jul-00	Determine whether the proposed Whitewater treatment system discharging to the proposed shallow buried trench sewage system designed to be buried in shallow sand fill provides sufficiency of compliance with 8.6.2.2.(2) and Table 8.6.2.2.A.	205/00

8.7.2.1.	Div. B 8.7.2.1.	00-60-792	2000	7-Dec-00	Determine whether the proposed sewage system, which includes terraced distribution pipe runs, provides sufficiency of compliance with 8.7.2.1.(1)(a)	205/00

8.7.3.2.	Div. B 8.7.3.2.	99-23-679	1999	15-Apr-99	Determine whether the proposed leaching bed with absorption trenches having only a vertical separation of 300 mm and soil with a percolation rate of 125 minutes per cm provides sufficiency of compliance with 8.7.3.2.(2)(e)	122/98

8.7.4.1. 8.7.4.2	Div. B 8.7.4.1. 8.7.4.2	05-14-1028		21-Apr-05	Determine whether the existing Class 4 sewage system fails to comply with Articles 8.7.4.1., 8.7.4.2. and Clause 8.9.1.2.(1)(c)	
8.7.4.2.(9)	Div. B 8.7.4.2.(11)	05-10-1024		10-Mar-05	Determine whether the proposed Class 4 sewage system will provide sufficiency of compliance with Article 8.2.1.4., Sentences 8.2.1.6.(2), 8.7.4.2.(9) and Table 8.2.1.6.B	
8.7.4.2.	Div. B 8.7.4.2.	99-35-691	1999	27-May-99	Determine whether, when considering an adequate daily loading rate, the Class 4 sewage system proposed without a 15 m mantle provides sufficiency of compliance with 8.7.4.2.(1)(b)	122/98
8.7.4.2.	Div. B 8.7.4.2.	99-55-711	1999	19-Aug-99	Determine whether the Class 4 sewage system filter bed and mantle proposed to be sited in an area with 1:3 slope provides sufficiency of compliance with 8.7.4.2.(8)	278/99
8.7.4.2.	Div. B 8.7.4.2.	99-44-700	1999	24-Jun-99	Determine whether a partially raised Class 4 sewage system, expanded as a result of an addition to the existing seasonal residence, with reduced setbacks and an undersized leaching bed provides sufficiency of compliance with s 8.7.4.2.(9) and 8.7.5.2.(3)	99-44-700

8.7.5.2.	Div. B 8.7.5.2.	99-44-700	1999	24-Jun-99	Determine whether a partially raised Class 4 sewage system, expanded as a result of an addition to the existing seasonal residence, with reduced setbacks and an undersized leaching bed provides sufficiency of compliance with s 8.7.4.2.(9) and 8.7.5.2.(3)	278/99

8.8.1.2.	Div. B 8.8.1.2.	05-11-1025		10-Mar-05	Determine whether the proposed installation of a Class 5 sewage system (holding tank) provides sufficiency of compliance with Article 8.8.1.2.	
8.8.1.2.	Div. B 8.8.1.2.	99-55-711	1999	19-Aug-99	Determine whether the Class 4 sewage system filter bed and mantle proposed to be sited in an area with 1:3 slope provides sufficiency of compliance with 8.7.4.2.(8)	278/99
8.8.1.2.	Div. B 8.8.1.2.	99-24-680	1999	15-Apr-99	Determine whether the two proposed 5,000 litre holding tanks to serve a 110 m2 cottage containing 6 bedrooms situated on a 1,538 m2 island provide sufficiency of compliance with 8.8.1.2. and 8.8.2.2.(1)	122/98
8.8.1.2.	Div. B 8.8.1.2.	02-14-869	2002	6-Jun-02	Determine whether the proposed installation of a Class 5 sewage system (holding tank) to serve a new cottage where the installation of a Code compliant Class 4 system is not possible, provides sufficiency of compliance with 8.8.1.2.(1)	283/01

8.8.2.2.	Div. B 8.8.2.2.	99-24-680	1999	15-Apr-99	Determine whether the two proposed 5,000 litre holding tanks to serve a 110 m2 cottage containing 6 bedrooms situated on a 1,538 m2 island provide sufficiency of compliance with 8.8.1.2. and 8.8.2.2.(1)	122/98

8.9.1.2.(1)(c)	Div. B 8.9.1.2.(1)(c)	05-14-1028		21-Apr-05	Determine whether the existing Class 4 sewage system fails to comply with Articles 8.7.4.1., 8.7.4.2. and Clause 8.9.1.2.(1)(c)	

PART 9

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
Part 9	Div. B Part 9	06-13-1083		23-Mar-06	Determine whether the proposed use of a composite lumber product, referred to as Life Long Decking System, for the exterior walking surface of the proposed deck serving a residential dwelling provides sufficiency of compliance with Parts 4 and 9	
9.1.1.4.(1)	Div. B 9.1.1.4.(1)	05-01-1015		13-Jan-05	Determine whether the storage structure, referred to by the Applicant as a tent, provides sufficiency of compliance with Sentences 1.1.3.1.(1) and 2.1.1.3.(1), Subsection 3.13.1. and Sentence 9.1.1.4.(1)	
9.3.2.1.	Div. B 9.3.2.1.	01-27-820	2001	7-Jun-01	Determine whether the materials used in the construction of a rain porch addition to the building known as KYO Zen Art's Centre meet the requirements of 9.3.2.1.	205/00
9.5.2.1.	Div. B 9.5.2.1.	99-15-671	1999	11-Mar-99	Determine whether the basement level bathrooms, as constructed, with ceiling heights ranging from 1,950 mm (6 ft, 5 in) to 2,075 mm (6 ft, 10 in), provide sufficiency of compliance with 9.5.2.1. of the 1990 Ontario Building Code at 387 393 Bell Street South, 12 - 24 MacLean Street, and 395 Bell Street South (Units 1 - 13), Ottawa, Ontario.	395/96
9.5.2.1.	Div. B 9.5.2.1.	01-20-813	2001	26-Apr-01	Determine whether the proposed seasonal-use sleeping cabins are required to be barrier-free accessible, when considering 9.5.2.1. and 3.8.1.1.(1)(c)	205/00
9.5.2.1.	Div. B 9.5.2.1.	02-20-875	2002	1-Aug-02	Determine whether the conversion of a century home into a six room inn, where no renovation to the existing entranceways is contemplated, is required to provide barrier-free access in accordance with 9.5.2.1.(1) and Section 3.8. when considering Part 11 and s 11.4.2.3.(1) and 11.4.3.4.(2)	283/01
9.5.2.1.	Div. B 9.5.2.1.	02-20-875	2002	1-Aug-02	Determine whether the conversion of a century home into a six room inn, where no renovation to the existing entranceways is contemplated, is required to provide barrier-free access in accordance with 9.5.2.1.(1) and Section 3.8. when considering Part 11 and s 11.4.2.3.(1) and 11.4.3.4.(2)	283/01
9.5.2.1.	Div. B 9.5.2.1.	01-40-833	2001	30-Aug-01	Determine whether the proposed security gate house, that has not been designed for barrier-free access, provides sufficiency of compliance with s 9.5.2.1., 3.8.1.1., 3.8.1.2. and 3.8.2.3.	205/00

9.5.2.1.	Div. B 9.5.2.1.	00-27-759	2000	21-Sep-00	Determine whether the subject commercially-used log house, which was disassembled, rebuilt at another location and provided with a barrier-free path of travel, is required to provide barrier-free accessibility in the proposed new washroom when considering 2.1.1.7.(2) and 9.5.2.1	00-27-759

9.7.1.2.	Div. B 9.7.1.2.	01-11-804	2001	15-Mar-01	Determine whether the proposed design of the original Verona Suite plan, that includes a windowless, enclosed “study” room, complies with s 3.7.2.1.(1) and 9.7.1.2.(1	205/00

9.7.1.3.	Div. B 9.7.1.3.	99-37-693	1999	3-Jun-99	Determine whether the unobstructed open width portion of the casement windows complies with 9.7.1.3.(1)(b)	122/98

9.8.2.1.	Div. B 9.8.4.1.	00-12-744	2000	29-Mar-00	Determine whether the as-constructed three separate and irregular stairs provide sufficiency of compliance with s 9.8.2.1.(1) and 9.8.3.1.(1) and 9.8.5.2	395/96
9.8.2.1.	Div. B 9.8.4.1.	00-12-744	2000	29-Mar-00	Determine whether the as-constructed three separate and irregular stairs provide sufficiency of compliance with s 9.8.2.1.(1) and 9.8.3.1.(1) and 9.8.5.2	395/96
9.8.2.1.	Div. B 9.8.4.1.	00-54-786	2000	2-Nov-00	Determine whether the proposed guard comprised mainly of 35 mm diameter acrylic rods complies with s 9.8.8.8. and 4.1.10.1. and whether the irregular curved stair provides sufficiency of compliance with 9.8.2.1.(1)	205/00
9.8.2.1.	Div. B 9.8.4.1.	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91

9.8.3.1.	Div. B 9.8.4.2. &.5	00-12-744	2000	29-Mar-00	Determine whether the as-constructed three separate and irregular stairs provide sufficiency of compliance with s 9.8.2.1.(1) and 9.8.3.1.(1) and 9.8.5.2	395/96
9.8.3.1.	Div. B 9.8.4.2. &.5	00-12-744	2000	29-Mar-00	Determine whether the as-constructed three separate and irregular stairs provide sufficiency of compliance with s 9.8.2.1.(1) and 9.8.3.1.(1) and 9.8.5.2	395/96

9.8.3.1.	Div. B 9.8.4.2. &.5	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91

9.8.3.3.	Div. B 9.8.2.1.	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91
9.8.3.3.	Div. B 9.8.2.1.	99-68-724	1999	18-Nov-99	Determine whether the as constructed single stair serving a second storey loft measuring 813 mm in width between wall faces provides sufficiency of compliance with 9.8.3.3.(2)	278/99
9.8.3.3.	Div. B 9.8.2.1.	00-25-757	2000	25-May-00	Determine whether the eighteen sets of as-built spiral stairs, which are not required exit stairs and are measured at 780 mm in width and 50 mm and 160 mm in minimum and average tread depth respectively, are required to comply with 9.8.3.3.(2) and s 3.3.1.15 and 9.8.5.2	205/00
9.8.3.3.	Div. B 9.8.2.1.	00-58-790	2000	30-Nov-00	Determine whether the as-built exterior concrete stairs and landings, having widths ranging from 814 mm to 850 mm, provide sufficiency of compliance with s 9.8.3.3., 9.8.4.1. and 9.9.3.2.	205/00

9.8.4.1.	Div. B 9.8.6.3.	00-58-790	2000	30-Nov-00	Determine whether the as-built exterior concrete stairs and landings, having widths ranging from 814 mm to 850 mm, provide sufficiency of compliance with s 9.8.3.3., 9.8.4.1. and 9.9.3.2.	205/00
9.8.4.1.	Div. B 9.8.6.3.	00-18-750	2000	14-Jun-00	Determine whether the as-built landings that are not as long as the width of the stairs they serve provide sufficiency of compliance with 9.8.4.1.(1)	205/00
9.8.4.1.	Div. B 9.8.6.3.	00-14-746	2000	29-Mar-00	Determine whether the as-built stair landing that measures 1093 by 915 mm and serves a stair 1093 mm in width, the lack of a second handrail in a 1093 mm wide stair and the absence of a railing at the lower flight (comprised of two risers) in the stair between the ground and second floor provide sufficiency of compliance with s 9.8.4.1.(1), 9.8.7.1.(1) and 9.8.7.2.(2) respectively	597/99

9.8.5.2.(1)	Div. B 9.8.4.4.	05-51-1065		3-Nov-05	Determine whether the as-installed spiral staircase having a minimum run of 82.5 mm provides sufficiency of compliance with Sentence 9.8.5.2.(1)	
9.8.5.2.(1)	Div. B 9.8.4.4.	05-43-1057		22-Sep-05	Determine whether the as-constructed spiral stairs having a minimum run of less than 150 mm provides sufficiency of compliance with Sentence 9.8.5.2.(1)	
9.8.5.2.	Div. B 9.8.4.4.	00-25-757	2000	25-May-00	Determine whether the eighteen sets of as-built spiral stairs, which are not required exit stairs and are measured at 780 mm in width and 50 mm and 160 mm in minimum and average tread depth respectively, are required to comply with 9.8.3.3.(2) and s 3.3.1.15 and 9.8.5.2	205/00
9.8.5.2.	Div. B 9.8.4.4.	00-12-744	2000	29-Mar-00	Determine whether the as-constructed three separate and irregular stairs provide sufficiency of compliance - 9.8.2.1.(1) and 9.8.3.1.(1) and 9.8.5.2	395/96
9.8.5.3.	Div. B 9.8.4.5.	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91
9.8.7.1.	Div. B 9.8.7.1.	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91
9.8.7.2.	Div. B 9.8.7.2.	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91
9.8.7.6.	Div. B 9.8.7.6.	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91
9.8.8.1.(1)	Div. B 9.8.8.1.(1)	06-24-1094		22-Jun-06	Determine whether the 0.6 m wide stationary platform located at the rear of the garage, within which an automated platform operates, having been constructed without guards provides sufficiency of compliance with Sentence 9.8.8.1.(1)	
9.8.8.2.	Div. B 9.8.8.3.	03-16-914	2003	1-May-03	Determine whether the as-built stair guard constructed to a height of 819.2 mm as measured vertically above the stair nosings and built in accordance with 9.8.8.2.(4) of the Ontario Building Code (OBC) complies with the intent of OBC 9.8.8.5. to reduce the likelihood of climbing, and whether the same guard with semi-circular elements measured at 698.5 mm above the stair nosings provides sufficiency of compliance with 9.8.8.5.	283/01

9.8.8.2.	Div. B 9.8.8.3.	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91

9.8.8.4.	Div. B 9.8.8.5.	00-40-772	2000	24-Aug-00	Determine whether the as-built stairs, handrails and guards provide sufficiency of compliance with s 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), 9.8.5.2., s 9.8.5.3.(1) and (2), 9.8.7.1.(1)(a), s 9.8.7.2. and 9.8.7.6., 9.8.8.2.(5) and 9.8.8.4.	400/91
9.8.8.4.	Div. B 9.8.8.5.	99-21-677	1999	8-Apr-99	Determine whether the modified guard with a total height of 915 mm, consisting of a single steel rail supported by posts located approximately every 1,200 mm constructed upon the original (610 mm in height) historic iron lattice and wood guard, provides sufficiency of compliance with 9.8.8.4.(1) and 9.8.8.5.	122/98
9.8.8.4.	Div. B 9.8.8.5.	00-08-740	2000	17-Feb-00	Determine whether the as-installed ornamental metal guards and rails, that include pickets ranging in thickness from 13 to 31 mm and sections of scroll pattern, and that have triangular openings (large enough to insert a spherical object 100 mm in diameter) formed by the stair tread and riser and the bottom cord of the railing provides sufficiency of compliance with 9.8.8.5. and 9.8.8.4.(1) respectively	597/99

9.8.8.5	Div. B .9.8.8.6.	05-22-1036		7-Jun-05	Determine whether the as-constructed guardrail, consisting of metal pickets with decorative elements at their mid-points, around the main stairs in a one storey, Group C building provides sufficiency of compliance with Sentence 9.8.8.5.(1)	
9.8.8.5	Div. B 9.8.8.6.	02-40-895	2002	21-Nov-02	Determine whether the 800 mm non-climbable zone required for guards in 9.8.8.5. of the Ontario Building Code may be measured directly from the level of the walking surface to a height of 800 mm and, if so, whether the as-installed guard, having pickets with horizontal cross members at approximately 787 mm above the walking surface, provides sufficiency of compliance with 9.8.8.5.	283/01
9.8.8.5.	Div. B 9.8.8.6.	01-62-855	2001	13-Dec-01	Determine whether the proposed interior and exterior guards to be comprised of wrought iron balusters containing sections of ornamental floral design and scroll patterns within the area between 100 mm and 900 mm above the walking surface, provide sufficiency of compliance with 9.8.8.	283/01
9.8.8.5.	Div. B 9.8.8.6.	00-51-783	2000	19-Oct-00	Determine whether the as-built guards, comprised mainly of an ornamental floral design, provide sufficiency of compliance with 9.8.8.5.	205/00
9.8.8.5.	Div. B 9.8.8.6.	02-03-858	2002	17-Jan-02	Determine whether the as-installed design of the vertical steel pickets, which includes ornamental “birdcages” and “rosettes” set at a spacing of 55.5 mm (2 3/16 in) for a guard on a horizontal surface and slightly less for a guard serving a stair, complies with the intent of 9.8.8.5.(1)	283/01

9.8.8.5.	Div. B 9.8.8.6.	01-56-849	2001	8-Nov-01	Determine whether the as-installed guard on an exterior deck having a horizontal member located at 165 mm above the walking surface, provides sufficiency of compliance with 9.8.8.5.(1)	283/01
9.8.8.5.	Div. B 9.8.8.6.	01-54-847	2001	25-Oct-01	Determine whether the as-installed guard serving these second floor balconies and having a horizontal member located at approximately 150 mm to 160 mm above the floor level, provides sufficiency of compliance with 9.8.8.5.(1)	283/01
9.8.8.5.	Div. B 9.8.8.6.	00-08-740	2000	17-Feb-00	Determine whether the as-installed ornamental metal guards and rails, that include pickets ranging in thickness from 13 to 31 mm and sections of scroll pattern, and that have triangular openings (large enough to insert a spherical object 100 mm in diameter) formed by the stair tread and riser and the bottom cord of the railing provides sufficiency of compliance with 9.8.8.5. and 9.8.8.4.(1) respectively	597/99
9.8.8.5.	Div. B 9.8.8.6.	99-73-729	1999	2-Dec-99	Determine whether a guard with a bottom rail, measured at more than 100 mm to its top, complies with requirements of 9.8.8.5.(1)	278/99
9.8.8.5.	Div. B 9.8.8.6.	99-69-725	1999	18-Nov-99	Determine whether the as constructed guard, consisting of numerous joined diagonal members, provides sufficiency of compliance with 9.8.8.5.(1)	278/99
9.8.8.5.	Div. B 9.8.8.6.	99-21-677	1999	8-Apr-99	Determine whether the modified guard with a total height of 915 mm, consisting of a single steel rail supported by posts located approximately every 1,200 mm constructed upon the original (610 mm in height) historic iron lattice and wood guard, provides sufficiency of compliance with 9.8.8.4.(1) and 9.8.8.5.	122/98

9.8.8.7	Div. B 9.8.8.7.	00-45-777	2000	7-Sep-00	Determine whether the as-built guard provides sufficiency of compliance with s 9.8.8.7. and 9.8.8.8.	115/89

9.8.8.8.	Div. B 9.8.8.2.	04-27-982		7-Jun-04	Determine whether the as-constructed exterior deck serving a Group C occupancy, which is comprised of a composite material referred to as “Life-Long Decking” that is manufactured by Brite Manufacturing Inc., will provide sufficiency of compliance with Articles 9.8.8.8. and 4.1.10.1.	220/02
9.8.8.8.	Div. B 9.8.8.2.	00-54-786	2000	2-Nov-00	Determine whether the proposed guard comprised mainly of 35 mm diameter acrylic rods complies with s 9.8.8.8. and 4.1.10.1. and whether the irregular curved stair provides sufficiency of compliance with 9.8.2.1.(1)	205/00
9.8.8.8	Div. B 9.8.8.2..	00-45-777	2000	7-Sep-00	Determine whether the as-built guard provides sufficiency of compliance with s 9.8.8.7. and 9.8.8.8.	115/89

9.8.9.1.(1)	Div. B 9.8.9.2.	03-49-947	2003	20-Nov-03	Determine whether the as-built exterior concrete front entrance stairs, which have more than two risers and two treads and are supported by concrete patio stones, provide sufficiency of compliance with 9.8.9.1.(1)	220/02
9.9.3.2.	Div. B 9.9.3.2.	00-58-790	2000	30-Nov-00	Determine whether the as-built exterior concrete stairs and landings, having widths ranging from 814 mm to 850 mm, provide sufficiency of compliance with s 9.8.3.3., 9.8.4.1. and 9.9.3.2.	205/00
9.9.5.5.	Div. B 9.9.5.5.	99-32-688	1999	13-May-99	Determine whether the existing gravel floor is required to comply with s 4.1.1.3.(1) and 4.1.1.7.(1), 3.8.1.3., and s 3.8.2.1.(1) and 9.9.5.5.(2)	278/99
9.9.7.2.(2)	Div. B 9.9.7.3.(2)	99-03-659	1999	19-Jan-99	Determine whether the proposed ground floor elevator lobby, constructed without enclosure, provides sufficiency of compliance with 9.9.7.2.(2)	122/98
9.9.9.1.(1)(a) 9.9.9.1.(2)	Div. B 9.9.9.1.	05-44-1058		22-Sep-05	Determine whether the construction of a third floor loft area, which includes open stairwells from the second floor to the third floor loft area, provides sufficiency of compliance with Clause 9.9.9.1.(1)(a) and Sentence 9.9.9.1.(2)	
9.10.4.1.(2)	Div. B 9.10.4.1.(2)	06-02-1072		12-Jan-06	Determine whether the 4th level “loft” design in a residential townhouse development provides sufficiency of compliance with the definition of “mezzanine” contained in Sentence 1.1.3.2.(1) and with the provisions of Sentence 9.10.4.1.(2)	
9.10.9.11	. Div. B 9.10.9.11	02-33-888	2002	17-Oct-02	Determine whether the existing use of the subject building would require a firewall to separate the residential occupancy from the horse stable when considering 1.2.1.2. of the National Farm Building Code or whether, in the alternative, the proposed fire separation between the two uses will provide sufficiency of compliance with 9.10.9.11.(2)	283/01
9.10.11.1.	Div. B 9.10.11.1.	01-06-799	2001	15-Feb-01	Determine whether the proposed stacked townhouse units, with property lines occurring on both horizontal and vertical planes between them, comply with the requirements of s 9.10.11.1.(1), 7.1.6.4.(1) and 7.1.7.2.(1)	205/00
9.10.14.1	Div. B 9.10.14.4.	05-08-1022		4-Apr-05	Determine whether the proposed direct vent fireplace sidewall terminations, constructed of type 304 stainless steel and located in walls having a limiting distance ranging from 0.55 m to 1.2 m provides sufficiency of compliance with Articles 9.10.14.1. and 9.10.14.5.	

9.10.14.5.	Div. B 3.2.3.5.	05-08-1022		4-Apr-05	Determine whether the proposed direct vent fireplace sidewall terminations, constructed of type 304 stainless steel and located in walls having a limiting distance ranging from 0.55 m to 1.2 m provides sufficiency of compliance with Articles 9.10.14.1. and 9.10.14.5.	

9.10.14.12.	Div. B 9.10.15.5	00-30-762	2000	29-Jun-00	Determine whether the existing exposing building face that does not offer a fire-resistance rating of 45 minutes and is clad with combustible siding, but which has been built with a zero metre limiting distance, provides sufficiency of compliance with 9.10.14.12.(5)	205/00

9.10.19.3.	Div. B 9.10.20.3.	02-01-856	2002	17-Jan-02	Determine whether the proposed fire access route, when considering the addition of a firewall between units within a residential townhouse block, creating “buildings” having an area of less than 600 m2, complies with the access route requirements of 9.10.19.3.	283/01
9.10.21.2.	Div. B 9.10.22.2.	03-04-902	2003	16-Jan-03	Determine whether the as installed upper kitchen cabinet valance, situated at the front edge of the underside of the cabinet approximately 360 mm above the counter surface and adjacent to the range/stove opening, provides sufficiency of compliance with s 9.10.21.2. and 9.10.21.3.	283/01
9.10.21.3.	Div. B 9.10.22.3.	03-04-902	2003	16-Jan-03	Determine whether the as installed upper kitchen cabinet valance, situated at the front edge of the underside of the cabinet approximately 360 mm above the counter surface and adjacent to the range/stove opening, provides sufficiency of compliance with s 9.10.21.2. and 9.10.21.3.	283/01
9.12.2.2.	Div. B 9.12.2.2.	01-33-826	2001	19-Jul-01	Determine whether the shallow (450 to 500 mm), insulated garage footings and foundations provide sufficiency of compliance with 9.12.2.2.	205/00
9.12.2.2.	Div. B 9.12.2.2.	99-17-673	1999	24-Mar-99	Determine whether a portion of a basement foundation wall and the patio retaining walls, as constructed, complies with 9.12.2.2.(1) and the structural requirements of Part 4 respectively	122/98
9.14.2.1.	Div. B 9.14.2.1.	03-27-925	2003	4-Nov-03		220/02
9.15.4.6.	Div. B 9.15.4.9.	03-27-925	2003	4-Nov-03		220/02
9.16.3.	Div. B 9.16.3.	99-41-697	1999	17-Jun-99	Determine whether a drainage system is required beneath the basement level concrete slab-on-grade as per Subsection 9.16.3.	278/99

9.16.4.4.	Div. B 9.16.4.3.	02-39-894	2002	21-Feb-03	Determine whether the as-constructed basement concrete floor slab which varies in thickness from 64 mm to 89 mm provides sufficiency of compliance with 9.16.4.4.	283/01
9.20.8.3.	Div. B 9.20.8.3.	03-27-925	2003	4-Nov-03		220/02
9.21.	Div. B 9.21.	01-34-827	2001	19-Jul-01	Determine whether the proposed radiant thermal mass brick heating unit, having a Finnish design, provides sufficiency of compliance with Sections 9.21. and 9.22.	205/00
9.22.	Div. B 9.22.	01-34-827	2001	19-Jul-01	Determine whether the proposed radiant thermal mass brick heating unit, having a Finnish design, provides sufficiency of compliance with Sections 9.21. and 9.22.	205/00
9.23	. Div. B 9.23	01-03-796	2001	8-Feb-01	Determine whether the various identified alleged deficiencies provide sufficiency of compliance with the relevant provisions of the Ontario Building Code	205/00
9.23.2.2.	Div. B 9.23.2.2.	03-27-925	2003	4-Nov-03		220/02
9.23.2.3.	Div. B 9.23.2.3.	03-27-925	2003	4-Nov-03		220/02
9.23.5.1.	Div. B 9.23.5.1.	03-27-925	2003	4-Nov-03		220/02

9.23.7.2.	Div. B 9.23.7.2.	03-27-925	2003	4-Nov-03		220/02
9.23.17.5..		03-08-906	2003	20-Feb-03	Determine whether the proposed seasonal boathouse clad with horizontally installed bevelled wood siding and mounted directly onto the framing without the use of a sheathing membrane provides sufficiency of compliance with 9.23.17.6.	283/01
9.23.17.6.	Div. B 9.27.3.6.	03-08-906	2003	20-Feb-03	Determine whether the proposed seasonal boathouse clad with horizontally installed bevelled wood siding and mounted directly onto the framing without the use of a sheathing membrane provides sufficiency of compliance with 9.23.17.6.	283/01
9.25.2.1.	Div. B 9.25.2.1.	99-56-712	1999	7-Oct-99	Determine whether the proposed insulation system and wall assembly composed of compressed, stacked straw bales enclosed by metal lath covered on both sides with 15 mm cement stucco and coated (on the outer surface of the interior only) with a waterproof finish provides sufficiency of compliance with s 9.25.2.1.(1), (2) and (4), 9.25.2.3.(1), 9.25.3.1., 9.25.4.1., 9.25.4.2.(5) and s 9.28.4.2. and 9.28.4.3.	278/99
9.25.2.3.	Div. B 9.25.2.2.	99-56-712	1999	7-Oct-99	Determine whether the proposed insulation system and wall assembly composed of compressed, stacked straw bales enclosed by metal lath covered on both sides with 15 mm cement stucco and coated (on the outer surface of the interior only) with a waterproof finish provides sufficiency of compliance with s 9.25.2.1.(1), (2) and (4), 9.25.2.3.(1), 9.25.3.1., 9.25.4.1., 9.25.4.2.(5) and s 9.28.4.2. and 9.28.4.3.	278/99
9.25.2.3.	Div. B 9.25.2.2.	02-36-891	2002	7-Nov-02	Determine whether the insulation used to wrap the attic duct work provides sufficiency of compliance with s 9.25.2.3.(1), 9.33.1.1.(1) and 6.2.4.3.(1) and whether the as-constructed wall assembly complies with the air barrier and vapour barrier requirements of 9.25.3.1.(1), 9.25.3.2.(1), 9.25.3.3.(1) and 9.25.4.1.(1) when considering s 5.4.1.1.(2) and 5.5.1.1.(2).	283/01

9.25.3.1.	Div. B 9.25.3.1.	02-36-891	2002	7-Nov-02	Determine whether the insulation used to wrap the attic duct work provides sufficiency of compliance with s 9.25.2.3.(1), 9.33.1.1.(1) and 6.2.4.3.(1) and whether the as-constructed wall assembly complies with the air barrier and vapour barrier requirements of 9.25.3.1.(1), 9.25.3.2.(1), 9.25.3.3.(1) and 9.25.4.1.(1) when considering s 5.4.1.1.(2) and 5.5.1.1.(2).	283/01
9.25.3.1.	Div. B 9.25.3.1.	99-56-712	1999	7-Oct-99	Determine whether the proposed insulation system and wall assembly composed of compressed, stacked straw bales enclosed by metal lath covered on both sides with 15 mm cement stucco and coated (on the outer surface of the interior only) with a waterproof finish provides sufficiency of compliance with s 9.25.2.1.(1), (2) and (4), 9.25.2.3.(1), 9.25.3.1., 9.25.4.1., 9.25.4.2.(5) and s 9.28.4.2. and 9.28.4.3.	278/99
9.25.3.2.	Div. B 9.25.3.2.	02-36-891	2002	7-Nov-02	Determine whether the insulation used to wrap the attic duct work provides sufficiency of compliance with s 9.25.2.3.(1), 9.33.1.1.(1) and 6.2.4.3.(1) and whether the as-constructed wall assembly complies with the air barrier and vapour barrier requirements of 9.25.3.1.(1), 9.25.3.2.(1), 9.25.3.3.(1) and 9.25.4.1.(1) when considering s 5.4.1.1.(2) and 5.5.1.1.(2).	283/01
9.25.4.1.	Div. B 9.25.4.1.	05-05-1019		20-Jan-05	Determine whether the as-constructed ICF wall system in a 167.2 m2 Group C dwelling, where no vapour barrier is provided, will provide sufficiency of compliance with Article 9.25.4.1.	
9.25.4.1	. Div. B 9.25.4.1	99-56-712	1999	7-Oct-99	Determine whether the proposed insulation system and wall assembly composed of compressed, stacked straw bales enclosed by metal lath covered on both sides with 15 mm cement stucco and coated (on the outer surface of the interior only) with a waterproof finish provides sufficiency of compliance with s 9.25.2.1.(1), (2) and (4), 9.25.2.3.(1), 9.25.3.1., 9.25.4.1., 9.25.4.2.(5) and s 9.28.4.2. and 9.28.4.3.	278/99
9.25.4.2.	Div. B 9.25.4.2.	99-56-712	1999	7-Oct-99	Determine whether the proposed insulation system and wall assembly composed of compressed, stacked straw bales enclosed by metal lath covered on both sides with 15 mm cement stucco and coated (on the outer surface of the interior only) with a waterproof finish provides sufficiency of compliance with s 9.25.2.1.(1), (2) and (4), 9.25.2.3.(1), 9.25.3.1., 9.25.4.1., 9.25.4.2.(5) and s 9.28.4.2. and 9.28.4.3.	278/99
9.26.5.1.	Div. B 9.26.5.1.	01-12-805	2001	26-Apr-01	Determine whether the as-built roofs with a slope of 7 ½/12 that was not constructed with eave protection, except one layer of 15 lb building paper, provides sufficiency of compliance with 9.26.5.2	205/00

9.26.5.2.	Div. B 9.26.5.2.	01-12-805	2001	26-Apr-01	Determine whether the as-built roofs with a slope of 7 ½/12 that was not constructed with eave protection, except one layer of 15 lb building paper, provides sufficiency of compliance with 9.26.5.2	205/00
9.27.3.2.	Div. B 9.27.3.8.	03-27-925	2003	4-Nov-03		220/02
9.28.4.3.	Div. B 9.28.4.3.	99-56-712	1999	7-Oct-99	Determine whether the proposed insulation system and wall assembly composed of compressed, stacked straw bales enclosed by metal lath covered on both sides with 15 mm cement stucco and coated (on the outer surface of the interior only) with a waterproof finish provides sufficiency of compliance with s 9.25.2.1.(1), (2) and (4), 9.25.2.3.(1), 9.25.3.1., 9.25.4.1., 9.25.4.2.(5) and s 9.28.4.2. and 9.28.4.3.	278/99
9.29.2.	Div. B 9.29.2.	98-49-654	1998	15-Dec-98	Determine whether the non-water resistant drywall, as installed, in the main bathroom and the master bedroom ensuite washroom provides sufficiency of compliance with Subsection 9.29.2	122/98
9.30.1.2	Div. B 9.30.1.2	02-25-880	2002	8-Aug-02	Determine whether the prefinished hardwood flooring proposed for the kitchen of a single detached residential building provides sufficiency of compliance with 9.30.1.2.	283/01
9.30.1.2	Div. B 9.30.1.2	02-24-879	2002	8-Aug-02	Determine whether the prefinished hardwood flooring proposed for the kitchen of a single detached residential building provides sufficiency of compliance with 9.30.1.2.	283/01
9.31.4.1.	Div. B 9.31.4.1.	02-29-884	2002	3-Oct-02	Determine whether the as-installed Class 1 (composting toilet) and Class 2 (greywater pit) systems which serve a seasonal dwelling in lieu of a Class 4 system provide sufficiency of compliance with 8.1.2.1.(1)	283/01
9.31.4.1.	Div. B 9.31.4.1.	00-26-758	2000	1-Jun-00	Determine whether proposed Class 1 (composting and incinerating toilet) and Class 2 (greywater system) systems in lieu of a Class 4 septic system to serve a newly built seasonal dwelling, complies with 8.1.2.1.(1) when considering s 7.1.6.1.(1) and 9.31.4.1.(1), and a subsequent proposal to include a different type of a Class 1 system (flush unit/composting toilet), a Class 2 system and a Class 3 system provides sufficiency of compliance with s 8.2.1.5.(1) and 8.2.1.4.(2)	205/00

9.33.1.1.	Div. B 9.33.1.1.	02-36-891	2002	7-Nov-02	Determine whether the insulation used to wrap the attic duct work provides sufficiency of compliance with s 9.25.2.3.(1), 9.33.1.1.(1) and 6.2.4.3.(1) and whether the as-constructed wall assembly complies with the air barrier and vapour barrier requirements of 9.25.3.1.(1), 9.25.3.2.(1), 9.25.3.3.(1) and 9.25.4.1.(1) when considering s 5.4.1.1.(2) and 5.5.1.1.(2).	283/01

9.36.2.1.	Div. B 9.36.2.1.	03-08-906	2003	20-Feb-03	Determine whether the proposed seasonal boathouse clad with horizontally installed bevelled wood siding and mounted directly onto the framing without the use of a sheathing membrane provides sufficiency of compliance with 9.23.17.6.	283/01

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
Part 11	Div. B Part 11	05-15-1029		21-Apr-05	Determine whether the installation of a septic field remediation technology known as the White KnightTM into an existing septic tank provides sufficiency of compliance with the Building Code when considering Part 11 and the definition of “septic tank” as outlined in Article 1.1.3.2.	
11.3.1.1.	Div. B 11.3.1.1.	02-19-874	2002	4-Sep-02	Determine whether the repair of an existing Class 4 septic system, specifically with respect to the grain size of the imported sand filter material being used, provides sufficiency of compliance with the provisions of 11.3.1.1.	283/01
11.3.1.1.	Div. B 11.3.1.1.	01-26-819	2001	7-Jun-01	Determine whether the work undertaken on ting house constitutes repair or renovation in accordance with s 11.3.1.1. and 11.3.3.1.(1)	205/00
11.3.3.1.	Div. B 11.3.3.1.	01-26-819	2001	7-Jun-01	Determine whether the work undertaken on ting house constitutes repair or renovation in accordance with s 11.3.1.1. and 11.3.3.1.(1)	205/00
11.3.3.1.	Div. B 11.3.3.1.	01-47-840	2001	27-Sep-01	Determine whether the construction of a replacement deck provides sufficiency of compliance with 11.3.3.1.(1)	283/01
11.4.1.1.	Div. B 11.4.1.1.	02-38-893	2002	21-Nov-02	Determine whether the compensating construction offered in an existing, 2 storey, 14 unit apartment building where the length of dead-end corridors exceeds the permitted maximum, provides sufficiency of compliance with 3.3.4.4.(1)(a) of the 1983 Ontario Building Code when considering 11.4.1.1.(1) and 11.5.2.1	283/01
11.4.1.1.	Div. B 11.4.1.1.	01-49-842	2001	11-Oct-01	Determine whether the use of the existing septic system on a property where the reconstruction of a single detached residential dwelling is proposed due to the destruction of existing dwelling by a house fire, provides sufficiency of compliance with s 11.4.1.1., 11.4.2.5. and 11.4.3.6.	283/01

11.4.2.3.	Div. B 11.4.2.3.	03-06-904	2003	23-Jan-03	Determine whether the existing floor assembly, which will separate a proposed bus terminal below from the existing parking garage above, will provide sufficiency of compliance with 11.4.2.3.(4)	283/01
11.4.2.3.	Div. B 11.4.2.3.	02-20-875	2002	1-Aug-02	Determine whether the conversion of a century home into a six room inn, where no renovation to the existing entranceways is contemplated, is required to provide barrier-free access in accordance with 9.5.2.1.(1) and Section 3.8. when considering Part 11 and s 11.4.2.3.(1) and 11.4.3.4.(2)	283/01

11.4.2.5.	Div. B 11.4.2.5.	01-49-842	2001	11-Oct-01	Determine whether the use of the existing septic system on a property where the reconstruction of a single detached residential dwelling is proposed due to the destruction of existing dwelling by a house fire, provides sufficiency of compliance with s 11.4.1.1., 11.4.2.5. and 11.4.3.6.	283/01

11.4.2.5.	Div. B 11.4.2.5.	98-45-650	1998	18-Nov-98	Determine whether changes to the existing tile field are required as a result of a proposed addition to an existing house in order to achieve sufficiency of compliance with Part 8 and 11.4.2.5.	122/98
11.4.2.5.	Div. B 11.4.2.5.	00-43-775	2000	24-Aug-00	Determine whether the performance level of the existing sewage system, when considering the proposed renovation that will increase the number of bedrooms and the total finished area by more than 15%, provides sufficiency of compliance with s 11.4.2.5.(3) and 11.4.3.6.(1)	205/00
11.4.2.5.	Div. B 11.4.2.5.	01-48-841	2001	11-Oct-01	Determine whether the performance level of the existing septic system, when considering a proposed second storey addition that will include a three piece ensuite bathroom, provides sufficiency of compliance with s 11.4.2.5.(3) and 11.4.3.6.(1)	283/01

11.4.3.4.	Div. B 11.4.3.4.	02-20-875	2002	1-Aug-02	Determine whether the conversion of a century home into a six room inn, where no renovation to the existing entranceways is contemplated, is required to provide barrier-free access in accordance with 9.5.2.1.(1) and Section 3.8. when considering Part 11 and s 11.4.2.3.(1) and 11.4.3.4.(2)	283/01

11.4.3.6.	Div. B 11.4.3.6.	00-43-775	2000	24-Aug-00	Determine whether the performance level of the existing sewage system, when considering the proposed renovation that will increase the number of bedrooms and the total finished area by more than 15%, provides sufficiency of compliance with s 11.4.2.5.(3) and 11.4.3.6.(1)	205/00

11.4.3.6.	Div. B 11.4.3.6.	01-49-842	2001	11-Oct-01	Determine whether the use of the existing septic system on a property where the reconstruction of a single detached residential dwelling is proposed due to the destruction of existing dwelling by a house fire, provides sufficiency of compliance with s 11.4.1.1., 11.4.2.5. and 11.4.3.6.	283/01
11.4.3.6.	Div. B 11.4.3.6.	01-48-841	2001	11-Oct-01	Determine whether the performance level of the existing septic system, when considering a proposed second storey addition that will include a three piece ensuite bathroom, provides sufficiency of compliance with s 11.4.2.5.(3) and 11.4.3.6.(1)	283/01

11.5.1.1.	Div. B 11.5.1.1.	99-45-701	1999	24-Jun-99	Determine whether the proposed replacement of a failed Class 4 sewage system to be sited near the existing location with less than 30 m to two dug wells is required to comply with 8.2.1.6.(2)	278/99

11.5.2.1	Div. B 11.5.1.1	02-38-893	2002	21-Nov-02	Determine whether the compensating construction offered in an existing, 2 storey, 14 unit apartment building where the length of dead-end corridors exceeds the permitted maximum, provides sufficiency of compliance with 3.3.4.4.(1)(a) of the 1983 Ontario Building Code when considering 11.4.1.1.(1) and 11.5.2.1	283/01

Part 11	Div. B Part 11	01-03-796	2001	8-Feb-01	Determine whether the various identified alleged deficiencies provide sufficiency of compliance with the relevant provisions of the Ontario Building Code	205/00
Part 11	Div. B Part 11	02-12-867	2002	21-Mar-02	Determine whether the proposed renovation and repair of an existing residential structure provide sufficiency of compliance with the relevant provisions of Parts 2 and 11	283/01

PART 12

1	1A	2	3	4	5	6
Statutory Reference 403/97	**Statutory Reference 350/06**	**BCC File No.**	**Year**	**Date**	**Short Description from Style**	**LAST APP. AMEND. TO 403/97**
12.1.1.1.		02-17-872	2002	20-Jun-02	Determine whether the proposed new senior's residence, when considering the date that the building permit application was substantially complete, is permitted to be built to the construction requirements of the 1990 Ontario Building Code (OBC) in accordance with 12.1.1.1.(1)(b)	283/01

AUTHORIZATION REPORT – The Romakowski System

1. Applicant

Thermoenergy Building Inc.
633 Johnson Road
Arnprior, Ontario
K7S 3G8

Tel: 613 623-8083
Fax: 613 623-7660

2. Manufacturing

Romakowski GmbH & Co. KG
Herdweg 341
D-86647 Butternwiesen
Germany

3. Description

Themoenergy Building Inc.'s, Romakowski GmbH System: Exterior Wall and Roof Systems (the "Romakowski System") are factory assembled, modular wall and roof panels consisting of a polyurethane foam core not less than 40 mm thick, faced with steel skins not less that 0.38 mm on the interior surface, and not less than 0.38 mm on the exterior surface.

The factory assembled metal panels have a polyurethane form core sandwiched between steel metal sheets. There is no air space between the insulation and the steel sheets. The steel sheets are pre-finished and are used as the exterior cladding, and interior finish of the building, and the panels have a double tongue and groove joint, or an overlapping joint that creates a labyrinth effect when connecting the panels to one another.

The Romakowski System is typically used in the construction of combustible commercial and industrial buildings.

4. Authorization Requested

The applicant sought a Building Materials Evaluation Commission ("BMEC") authorization for the use of the Romakowski System as innovative exterior walls and roofs in the construction of combustible Part 3 and Part 9 buildings.

5. Assessment

Reports and assessments provided by the Applicant show that if the Romakowski Roof and Wall Panels are designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted, and reviewed, but were not limited to:

1. German – Rosenheim, Test Results, Project 104 19357/1, dated November 25, 1997.

2. German – Rosenhiem, Test Results, Project 104 19357/3, dated November 25, 1997.

3. Quality Control Manual – Gutegemeinschaft Bauelemente aus Stahlblech e.V., "Guidelines for the implementation of monitoring inspection in accordance with the building products directives A section 1 and RAL-GZ 617 for Structural components in sheet steel", edition August 2002.

4. Manufacturer's Literature "Industrial Building Construction.

5. Manufacturer's Literature "Construction of Cooling and Deep-freeze Stores".

6. Manufacturer's Literature "Architectural Design".

7. Manufacturer's Literature "Roof Panels".

8. German Institute For Structural Engineering, Note of Authorization – Z-10.4-151 "ROMA rapid-assembly insulating panel P-ST, M-ST and D-ST, dated December 3, 2004

9. Letter Report, Hine Reichard Tomlin Inc. "Panel Characteristics", dated June 22, 2006.

10. Letter Report, Hine Reichard Tomlin Inc. "Panel Characteristics", dated July 11, 2006.

11. Manufacturer's Drawing Details: F233-7, F240-3, F014-1, F015-1, F016-1, F017-1, F018-1, F019-1, D010-5, D024-2, D103-1, D104-2, D105-2, D106-3, D107-1, D108-3.

12. Drawings:

a) Data Sheet-1 Span Table Guide
b) Data Sheet-2 Roof Panel Type D-St Characteristics and Spans
c) Data Sheet-3 Wall Panel Type M-St and P-St Characteristics.
d) Data Sheet-4 Wall Panel Type M-St-Span Table
e) Data Sheet-5 Wall Panel Type P-St Span Table
f) Detail-1, Section Thru' Floor and Wall Connection (Option 1)
g) Detail-2, Section Thru' Floor and Wall Connection (Option 2)
h) Detail-2, Section Thru' Wall and Roof Connection
i) Detail-3, Section Thru' Roof Ridge
j) Detail-4, Section Joint between Roof Panel
k) Detail-5, Section Thru' Window
l) Detail-6, Wall Corner In Plan.

6. Authorization

The Romakowski System is authorized for use as innovative exterior walls and roofs in the construction of combustible Part 3 and Part 9 buildings; all other requirements pertaining to the installation of the Romakowski System shall be subject to the requirements of the Building Code, and are subject to the following terms and conditions.

Note: If a conflict arises between the provisions of this authorization, or the manufacturer's installation instruction, then the most restrictive provision shall apply.

A. Specific Terms & Conditions

1. This authorization is valid only for Themoenergy Building Inc.'s Romakowski System.

2. The structural design and general review of the Romakowski System shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario); the Professional Engineer shall provide the chief building official with documents certifying that the design and installation conforms with Part 4 of the Building Code, and with this authorization.

3. The Romakowski System shall not be used in the construction of Group B "Care and Detention" occupancies, as they are defined in the Building Code.

4. The Romakowski System shall not be used in the construction of Group C "Residential" occupancies, as they are defined in the Building Code.

5. The Romakowski System is permitted for use in combustible construction only.

6. The Romakowski System is deemed to have met the requirements of Clauses 9.10.16.10.(1)(b) and 3.1.4.2.(1)(a) of the Building Code.

7. The Romakowski System wall panels shall not be constructed as structural elements of the building.

8. The Romakowski System shall be fastened to the supporting structure in accordance with the manufacturer's installation instructions.

9. For the purposes of spatial separations, Romakowski System shall not be used in an assembly required to be of noncombustible construction.

10. The Romakowski System, specifically the roof panels, shall be designed using a maximum allowable deflection limit of not less than L /180.

11. The Romakowski System, wall model series P-St and M-St, and Roof model series D-St are permitted for use when clad with steel having a minimum thickness of .38 mm

12. Documentation shall be submitted, as a part of the building permit application package, confirming that the design meets the requirements of Part 5 "Wind, Water and Vapour Protection" of the Building Code, where required for the specific building classification.

13. The Romakowski System shall not be used to support, or suspend appliances, fixtures, or equipment.

14. If the Romakowski Systems incorporate an opening within the panel(s), or is modified to accommodate a penetration within the panel, then additional information (e.g. testing, analysis, details…) demonstrating that the modified roof and or wall panel conforms to the Building Code shall be submitted to the chief building official for review.

B. General Conditions

1. The use of the Romakowsi Systems as described in the specific terms and conditions set out in 6.A. must comply with the *Building Code Act, 1992* (the "Act") as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6.A. above; or

(b) the occurrence of any of the events described in conditions 6.B.4.(a) and (b)(ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Act, or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 27 day of July 2006.

AUTHORIZATION REPORT – PHIX Cartridge System

1. Applicant

Green Turtle Technologies Inc.
12 Madison Avenue
Toronto, Ontario
M5R 2S6

Tel: 416 966-9400
Fax: 416 966-3449
Web: www.greenturtletech.com

2. Manufacturing

Information supplied to the BMEC, but withheld at the request of the Applicant.

3. Description

The PHIX Cartridge System (the "PHIX Cartridge") is designed for acid neutralization.

The PHIX Cartridge has four main components, the Manifold, Internal Skelton, the Treatment Chamber, and the Solid Collection Chamber, and is constructed out of 100% polypropylene.

The Manifold houses the PHIX Cartridge's three main connections: threads to the sink drainage outlet, and threads into the Treatment Chamber. The Internal Skelton directs the flow of the wastewater from the sink drainage outlet through the centre pipe into the Solid Collection Chamber for solids removal. The PHIX Media contained within the Treatment Chamber will neutralize the acidic wastewater based on the retention time required to complete the neutralization reaction. The neutralized wastewater will be channelled through a woven filter and exits the Manifold into the regular plumbing drainage system.

4. Authorization Requested

The Applicant sought a Building Materials Evaluation Commission ("BMEC") authorization for the use of the PHIX Cartridge as an engineered acidic wastewater neutralizing system that connects directly to an under the sink plumbing drainage system.

5. Assessment

Reports and assessment provided by the applicant demonstrate that if the PHIX Cartridge System is constructed, installed, operated, maintained and monitored in accordance with the limitations of the manufacturer specifications and conditions stated in this authorization, a level of performance equivalent to that required by the Building Code will be provided.

The following reports were submitted, and reviewed:

1. PHIX™ Neutralization Systems: Cartridge System "Technical Manual 2005, Version 1"

2. Material Safety Data Sheet – PHIX Media 3000, dated June 12, 2002.

3. Material Safety Data Sheet – PHIX Media 2000, dated January 12, 2005.

4. PHIX™ Neutralization Systems: Cartridge System "Owner's Manual, Green Turtle, Version 1".

5. Test Data and Test Analysis "Neutralization Testing with the PHIX Cartridge Unit".

6. Test Data and Test Analysis "Flow test of the PHIX Cartridge Unit"

7. Letter Approval: City of Chicago "PHIX Cartridge Systems and PHIX gravity System", dated February 23, 2005.

6. The PHIX Cartridge is authorized for use as an alternative means of acid neutralization in a plumbing system, as required by Articles 7.4.4.4. "Neutralization and Dilution Tanks", 7.5.4.4. "Venting of Corrosive Drain Piping", and Sentence 7.5.4.2.(6) of the Building Code; all other requirements pertaining to the installation and construction are subject to the requirements of the Building Code and are subject to the following terms and conditions

Note: If a conflict arises between this document and the provisions of the documents listed below, the most restrictive provision shall apply.

A. Specific Terms and Conditions

1. This authorization is valid only for Green Turtle Technologies.

2. This authorization is valid for the use of the PHIX Cartridge, for use with media 2000, and 3000.

3. The design of that portion of the plumbing system, pertaining to where the PHIX Cartridge is installed shall be performed by a professional engineer, as defined in the Building Code, and who is trained and experienced in the area of acid neutralization.

4. The documents associated with the PHIX Cartridge shall be stored in a safe and accessible location on-site, in the same room, and contain a minimum of the following information:

    a) The Green Turtle's contact information,
    b) Maintenance Schedule
    c) Material Safety Data Sheet,
    d) Warranty,
    e) Owners Manual,
    f) Emergency Contact Information, and
    g) A list of the chemicals, for the specific location, that the PHIX Cartridge was designed to neutralize.

5. The PHIX Cartridge shall be installed as per the manufacturer's installation instructions.

6. The PHIX Cartridge shall only be installed if a maintenance schedule, specific to the location and use, has been developed.

7. Copies of the PHIX Cartridge maintenance schedule and the on-site documents as listed in 6.A.4., shall be submitted to the chief building official, to form a part of the permit application package.

8. Documentation shall be submitted to the chief building official confirming that the wastewater from the PHIX Cartridge will comply with the local sewage by-law, and/or related applicable law listed in Article 1.1.3.3. "Applicable Law" of the Building Code.

9. The PHIX Cartridge shall be supported by a metal bracket that is fixed to the floor and raised up to the bottom of the unit, removing any loading that may be applied to the pipe, PHIX Cartridge, or the sink.

10. A trap is not permitted between the sink and the PHIX Cartridge.

11. The PHIX Cartridge shall only be used for under the sink laboratory applications.

12. The PHIX Cartridge shall only be installed where polypropylene pipes and fittings are permitted for use.

13. A vent is not permitted between the sink and the PHIX Cartridge.

14. A sticker containing the following information, posted in a conspicuous location, on a contrasting background, directly above the sinks(s) where PHIX Cartridge(s) has been installed shall include:

    a) Green Turtle's contact information,
    b) The following statement: "Warning: do not dispose of grease, organic waste, fats, oils, or any material for which the acid neutralization media was not designed in this sink", and
    c) PHIX Cartridge installed under the sink.

15. The aggregate design discharge through any PHIX Cartridge shall not exceed 21 litres per minute.

16. The PHIX Cartridge shall not be installed in connection with other appliances (e.g. dishwasher).

B. General Conditions

1. The use of the PHIX Cartridge and as described in the specific terms and conditions set out in 6.A. must comply with the *Building Code Act, 1992* (the "Act") as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6.A. above; or

    (b) the occurrence of any of the events described in conditions 6.B.4.(a) and (b)(ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

    (a) any change has been made to:

        (i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Act any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29 day of June 2006.

AUTHORIZATION REPORT – Roof and Wall Panels

1. Applicant

Four Season Solar Products, LLC
5005 Veterans Memorial Hwy
Holbrook, NY
USA, 117741

Tel: 631 563 4000
Fax: 631 218 9076
Web: www.fourseasonssunrooms.com

2. Manufacturing

Four Season Solar Products, LLC
5005 Veterans Memorial Hwy
Holbrook, NY
USA, 117741

3. Description

Four Seasons Solar Products, LLC's Structural Insulated Panel System (the "Roof and Wall Panels") may be used in the construction of unheated additions to residential occupancy buildings.

Components	**Roof Panel Size: 108 mm (4 ¼")**
Aluminum	0.6 mm
Expanded Polystyrene Foam	16 kg/m^3
OSB (interior) plus Blazeguard®1	11 mm
Aluminum	0.6 mm
Adhesive Type	Ashland or Rohm and Haas
Deflection Criteria	L / 180

Components	**Wall Panel Size: 76 mm (3")**
Aluminum	0.6 mm
Expanded Polystyrene Foam	16 kg/m^3
OSB (interior) plus Blazeguard®	11 mm
Aluminum	0.6 mm
Adhesive Type	Ashland or Rohm and Haas

Note 1: The Blazeguard® coating is applied to the interior surface of the 11 mm OSB.

4. Authorization Requested

The Applicant sought a Building Materials Evaluation Commission (the "BMEC") Authorization for the use of the Roof and Wall Panels for unheated additions, which may be an addition to a residential occupancy building that is subject to the requirements of Part 9 of the Building Code.

5. Assessment

Reports and assessments provided by the Applicant show that if the Roof and Wall Panels are designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted, and reviewed, but were not limited to:

1. Letter Report, Hannigan Engineering Limited "Structural Review for Sandwich Panels for Four Seasons Solar Products, LLC Sunroom Project Number S5228.

2. Quality Control Manual.

3. Protective Covering for Foam Plastic Test Report.

4. Blazeguard Product Specification.

5. TJC Test Report TT 50125-A "Sandwich Panel Tess Patio Roof Panels without Mullins", dated 27, 2003.

6. TJC Report TT 50125-A "Engineering Analysis of the Patio Roof without the Mullins", dated June27, 2003.

7. TJC Test Report TT 50125-B "Sandwich Panels Test Patio Roof Panels with Mullins" , dated June 27, 2003.

8. TJC Test Report TT 50125-B "Engineering Analysis of Patio Roof Panels with Mullins", dated June 27, 2003.

14. Standard Drawings for Sun and Shade Straight Eave.

15. ICC-ES Evaluation Report ER-4590P.

16. Standard Drawing for Sun and Shade Cathedral Room.

17. Tremco Tremsil 600 Product Specification.

18. Installation Manual Sun and Shade Straight Eave.

19. Installation Manual Sun and Shade Cathedral.

20. Engineering Summary Charts, July 13, 2006.

21. Die Drawings:
    a) 4” Adjustable Ridge Male
    b) 4” Roof H (Mullin)
    c) 4” Fixed Ridge
    d) 4” Ridge (Ledger)
    e) 4” Fascia
    f) 4” Adjustable Ridge Female Window Sill
    g) Sill
    h) Utility H
    i) Standard H

6. Authorization

The Roof and Wall Panels are authorized for use in unheated additions, which may be an addition to a building of residential occupancy; all other requirements pertaining to the installation of the Four Season Roof and Wall Panels shall be subject to the requirements of the Building Code, and are subject to the following terms and conditions:

Note: If a conflict arises between the provisions of this authorization, or the manufacturer’s installation instruction, then the most restrictive provision shall apply.

A. Specific Terms & Condition

1. This authorization is valid only for Four Season Solar Products, LLC

2. The structural design and general review of the Roof and Wall Panels shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario); the Professional Engineer shall provide the chief building official with documents certifying that the design and installation conforms with this authorization.

3. The structural system supporting the authorized Roof and Wall Panels shall have sufficient structural capacity as required by the Building Code.

4. The maximum allowable deflection of the Roof Panels as an expressed ratio of the clear span shall be L /180.

5. The use of the Roof and Wall Panels shall be limited to residential occupancy buildings that are subject to the requirements of Part 9 of the Building Code.

6. As the Roof and Wall Panels are used in unheated additions, the system need not meet the following Building Code requirements:

   (a) Subsection 9.25.2. “Thermal Insulation” and Section 9.38. “Thermal Design”,

   (b) Subsection 9.25.3. “Air Barrier Systems”, and

   (c) Subsection 9.25.4. “Vapour Barriers”.

7. The Roof and Wall Panels shall not be used where an assembly is required to have a fire resistance rating.

8. The Roof and Wall Panels shall be identified by a permanent stamp, sticker or mark indicating the manufacturer’s name or trademark.

9. If the Roof and Wall Panels incorporate an opening within the panel, or is modified to accommodate a penetration within the panel, then additional testing demonstrating that the modified roof and or wall panel conforms to the Building Code shall be submitted to the chief building official for review.

B. General Conditions

1. The use of the Roof and Wall Panels and as described in the specific terms and conditions set out in 6.A. must comply with the *Building Code Act, 1992* (the “Act”) as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6.A. above; or

(b) the occurrence of any of the events described in conditions 6.B.4.(a) and (b)(ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Act any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 27 day of July 2006.

Authorization Report - Camino Modular Floor System: SC Series

1. Applicant

Camino Modular Systems Inc.
89 Carlingview Drive
Toronto, Ontario
M9W 5E4

Tel: 416 675-2400
Fax: 416 675-2424
Web: www.camino-access-floors.com

2. Manufacturing Facilities

89 Carlingview Drive
Toronto, Ontario
M9W 5E4

3. Description

The Camino Modular Floor System SC Series (the "Camino SC System") used in office type occupancies consist of a 600 mm x 600 mm panel (610 mm x 610 mm), which are made up of a nominal 25 mm thick high density composite core, encased with galvanized steel sheets that are structurally bonded with a thermosetting adhesive to both faces.

The panels are supported by adjustable steel pedestals. Each panel is bolted to the pedestals by means of a screw type fastener, or alternatively, for a computer room application, the panels are supported on four sides by a bolted stringer system.

A 0.607 mm thick gauge galvanized steel channel, nominally 15 mm x 12.7 mm x 600 mm, is attached in the field to any edge that is cut, ensuring that the Camino SC System core is not exposed.

4. Authorization requested

The applicant sought a Building Materials Evaluation Commission (BMEC) authorization for the Camino SC System as an equivalent to the requirements of Sentence 3.1.5.8.(2). "Combustible Flooring Elements" of the Building Code.

5. Assessment

Reports and assessments provided by the applicant show that if the Camino SC System is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the Building Code will be provided.

The following is a list of the documents submitted, and reviewed, but not limited to:

1. Bodycoat Materials Testing Canada Inc. “CAN/ULC-S102.2 Surface Burning Characteristics of Access Flooring System”“, report number 05-02-988, December 22, 2005.

2. Camino Modular Systems Quality Assurance, Section 10270.

3. Underwriters’ Laboratories of Canada, File R16957, “Report on the Floor Panels under the Listing Program”, dated September 7, 2005.

4. BMEC Authorization File #90-17-145.

5. Camino Modular Systems, Manufacturer’s Specifications:

    (a) Bolted Stringer System for Steel Clad Access Floor Panel,
    (b) Heavy Duty Bolted Stringer Systems for Steel Clad Access Floor Panel
    (c) Low Profile Pedestal
    (d) Cornerlock System for Steel Clad Access Floor Panel
    (e) Snap on Stringer System for Steel Clad Access Floor Panel

6. Camino Modular Systems, Manufacturer’s Drawings:

    (a) Bridging Detail
    (b) Plenum Divider
    (c) Wall Mounted Handrail
    (d) Floor Mounted Handrail
    (e) Standard Ramp

7. Manufacturer’s Literature “SC Series”

8. Report prepared by Leber Rubes “Access Floor Panel: Camino Modular Systems, Inc. SC1000 / 1250 / 1300 / 1500 / 2000”, dated March 14, 2006.

9. Test Results, Bodycote Materials Testing Canada, Inc. “CAN/ULC–S102.2 Surface Burning Characteristic of “Assess Flooring System””, dated December 22, 2005.

10. Letter Report prepared by Leber Rubes, file number 2005-643, dated April 25, 2006.

6. Authorization

The Camino SC System is authorized for use in noncombustible construction, as an access floor panel system, as required by Sentence 3.1.5.8.(2). “Combustible Flooring Elements” of the Building Code; all other requirements pertaining to the design, installation and construction are subject to the regulations of the Building Code, and to the following terms and conditions:

Note: If a conflict arises between the provisions of this authorization, or the manufacturer’s installation instruction, then the most restrictive provision shall apply.

A. Specific Terms & Condition

1. This authorization is valid only for the Camino Modular Systems, Inc.,

2. This authorization is valid only for Camino SC System model numbers SC 1000, SC 1250, SC 1300, SC 1500, and SC 2000.

3. The space under the Camino SC System shall not be used for storage.

4. The Camino SC System shall not be designed to carry a uniform live load greater than 16 kPa.

5. The subfloor, in which the Camino SC System will be installed, shall be sufficiently constructed or deemed sufficient to carry the load of the Camino SC System.

6. The Camino SC System shall be installed as per “Camino Modular Systems Quality Assurance, SC Series with High Density Composite Core, Section 10270".

7. The Camino SC System shall be installed on a noncombustible, floor slab or subfloor.

8. Fibre optic cables and electrical wires located in the space under the Camino SC System shall not be considered as being protected against exposure to fire.

9. Where the Camino SC System is cut during field installations the exposed edge shall be:

    a) substantially covered by an electrical devise box protruding through the floor panel,

    b) positioned to abut interior construction surfaces and separated from the underfloor space by a continuous steel support channel, and

    c) covered by an overlapping channel, having a nominal 25 gauge cold rolled G40 steel with a galvanized coating, which substantially covers the cut edge of the panel.

10. If the space below the Camino SC Floor System is used as a plenum, then:

    a) except for optical fibre cables, electrical wires, and cables, then all materials within that space shall have a flame-spread rating of not more than 25 and a smoke developed classification of not more than 50,

    b) optical fibre cables, electrical wires, and cables shall exhibit a flame spread not more than 1.5 m, a smoke density not more than 0.5 at peak optical density and a smoke density not more than 0.15 at average optical density when tested in conformance with the Flame and Smoke Test in the Appendix to CAN/CSA C22.2 No. 0.3, "Test Methods for Electrical Wires and Cables" (i.e., FT6 Rating), and

    c) in addition to being noncombustible, all metal supports shall have a melting point not below 760 C^0.

B. General Conditions

1. The use of the Camino SC System as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

    (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

    (a) any change has been made to:

        (i) the material, system or building design that is the subject matter of this Authorization;

        (ii) the address of the applicant specified in Part 1 of this Authorization; or,

        (iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system BMEC may, after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29 day of June 2006.

    (b) Plenum Divider
    (c) Wall Mounted Handrail
    (d) Floor Mounted Handrail
    (e) Standard Ramp

7. Manufacturer’s Literature “C Series”

8. Report prepared by Leber Rubes “Access Floor Panel: Camino Modular Systems, Inc. SC1000 / 1250 / 1300 / 1500 / 2000”, dated March 14, 2006.

9. Test Results, Bodycote Materials Testing Canada, Inc. “CAN/ULC–S102.2 Surface Burning Characteristic of “Assess Flooring System””, dated December 22, 2005.

10. Letter Report prepared by Leber Rubes, file number 2005-643, dated April 25, 2006.

6. Authorization

The Camino WC System is authorized for use in noncombustible construction, as an access floor panel system, as required by Sentence 3.1.5.8.(2). “Combustible Flooring Elements” of the Building Code; all other requirements pertaining to the design, installation and construction are subject to the regulations of the Building Code, and to the following terms and conditions:

Note: If a conflict arises between the provisions of this authorization, or the manufacturer’s installation instruction, then the most restrictive provision shall apply.

A. Specific Terms & Condition

1. This authorization is valid only for the Camino Modular Systems, Inc.,

2. This authorization is valid only for Camino WC System model numbers WC 1000, WC1250, and WC1500.

3. The space under the Camino WC System shall not be used for storage.

4. The Camino WC System shall not be designed to carry a uniform live load greater than 16 kPa.

5. The subfloor, in which the Camino WC System will be installed, shall be sufficiently constructed or deemed sufficient to carry the load of the Camino WC System.

6. The Camino WC System shall be installed as per “Camino Modular Systems Quality Assurance, WC Series with High Density Composite Core, Section 10270".

7. The Camino WC System shall be installed on a noncombustible, floor slab or subfloor.

8. Fibre optic cables and electrical wires located in the space under the Camino WC System shall not be considered as being protected against exposure to fire.

9. Where the Camino WC System is cut during field installations the exposed edge shall be:

    a) substantially covered by an electrical devise box protruding through the floor panel,

    b) positioned to abut interior construction surfaces and separated from the underfloor space by a continuous steel support channel, and

    c) covered by an overlapping channel, having a nominal 25 gauge cold rolled G40 steel with a galvanized coating, which substantially covers the cut edge of the panel.

10. If the space below the Camino WC Floor System is used as a plenum, then:

    a) except for optical fibre cables, electrical wires, and cables, then all materials within that space shall have a flame-spread rating of not more than 25 and a smoke developed classification of not more than 50,

    b) optical fibre cables, electrical wires, and cables shall exhibit a flame spread not more than 1.5 m, a smoke density not more than 0.5 at peak optical density and a smoke density not more than 0.15 at average optical density when tested in conformance with the Flame and Smoke Test in the Appendix to CAN/CSA C22.2 No. 0.3, "Test Methods for Electrical Wires and Cables" (i.e., FT6 Rating), and

    c) in addition to being noncombustible, all metal supports shall have a melting point not below 760 C^0.

B. General Conditions

1. The use of the Camino WC System as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

    (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

    (a) any change has been made to:

        (i) the material, system or building design that is the subject matter of this Authorization;

        (ii) the address of the applicant specified in Part 1 of this Authorization; or,

        (iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system BMEC may, after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29 day of June 2006.

Authorization Report - CanyonRock™

1. Applicant

GAF Material Corporation
1361 Alps Road
Wayne, New Jersey
07470, USA

Tel: 973 872-4355
Fax: 973 682-5964
Web: www.gaf.com

2. Manufacturing Facilities

ICOT Ceramic Co Ltd
Dalan Industry District
Guanyao, Nanhai

Foshan City, Guangdong, China

3. Description

The CanyonRock™ Premium Decorative Stone (CanyonRock™) is a manufactured cementitious product that is designed and cast to simulate the appearance of natural stone in both colour and texture. CanyonRock™ products are manufactured in various shapes and sizes with irregular surfaces, which mimic those of natural stone. CanyonRock™ is made from a mix of Portland cement, light weight aggregates, air entrainment, and other admixtures. The surface of the CanyonRock™ has a water repellant coating.

4. Authorization Requested

The applicant sought a Building Materials Evaluation Commission (BMEC) authorization for the CanyonRock™ as an interior wall finish for use as a building material similar to those listed in Article 3.1.13.1. “Interior Finish Description” and in Section 9.29. “Interior Wall and Ceiling Finishes” of the Building Code; or as an acceptable material for use around fireplace openings as permitted by Sentence 9.22.9.1.(1) “Clearance of Combustible Materials” of the Building Code.

5. Assessment

Reports and assessments provided by the applicant show that if CanyonRock™ System is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the Building Code will be provided.

The following is a list of the documents submitted, and reviewed, but are not limited to:

1. Test results ASTM C567 “Standard Test Method for Density of Structural Lightweight Concrete”.

2. Test results ASTM C67 “Standard Test Method Sampling and Testing Brick and Structural Clay Tile”.

3. Test results ASTM C39 “Standard Test Method for Compressive Strength in Cylindrical Concrete Specimens.”

4. Test results ASTM C348 “Standard Test Method for Flexural Strength of Hydraulic-Cement Mortars.”

5. Test results ASTM C190 “Standard Test Method for Tensile Strength of Hydraulic-Cement Mortars.”

6. Test results ASTM C482 “Standard Test Method for Bond Strength of Ceramic Tile to Portland Cement.”

7. Test results ASTM C1364 “Standard Specification for Architectural Cast Stone.”

8. Test results ASTM C518 “Standard Test Method for Steady State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.”

9. Test results, Design Pressures, DCBCCO TAS 202 (Negative pressure only).

10. Test results, Large Missile Impact Test, TAS 201 ASTM E1886 and ASTM E1996.

11. Test results, Cyclic Load Test, TAS 203, ASTM E1886 and ASTM E1996.

12. Test results, Underwriters Laboratories Inc. ASTM E84, UL 723.

13. Test results, Underwriters Laboratories Canada S102 “Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies”

14. Test results, Underwriters Laboratories Canada, Non Combustibility Test S114 “Standard Method of Fire Test for Determination of non-Combustibility in Building Materials .

15. Manufacturer's Literature.
16. CanyonRock™ Installation Instructions, copyright © 2005.

17. Installation Drawings ST101 and ST102, issued 06/01/05.

18. Quality Control Manual for CanyonRock™, dated June 2005.

19. Correspondence, Underwriters' Laboratories of Canada, File R22143, dated March 9, 2006.

6. Authorization

The use of the CanyonRock™ is authorized as an acceptable interior wall finish for use as a building material similar to those listed in Article 3.1.13.1. "Interior Finish Description" and Section 9.29. "Interior Wall and Ceiling Finishes" of the Building Code; or as an acceptable material for use around fireplace openings as permitted by Sentence 9.22.9.1.(1) "Clearance of Combustible Materials", all other requirements pertaining to the design, installation and construction are subject to the regulations of the Building Code, and to the following terms and conditions:

Note: Although this authorization is specific to the interior use of the CanyonRock™ it does not preclude the exterior use of this product, where an alternative approval is obtained.

A. Specific Terms & Conditions

1. This authorization is valid only for GAF Material Corporation.

2. Subject to the specific terms and conditions, the CanyonRock™ is permitted for use with interior wall applications.

3. The CanyonRock™ is permitted to be installed on vertical surfaces.

4. The material, design and installation shall be in accordance with CanyonRock™ Installation Instructions, copyright © 2005.

5. Subject to the approval of the chief building official, the building's structure shall be sufficiently supported to transfer the design weight of the CanyonRock™ assembly.

6. The CanyonRock™ shall not be load bearing.

7. The CanyonRock™ is considered to be noncombustible for the purposes of 9.22.9.1. “Clearance of Combustible Materials”, and permitted to be installed around fire place openings.

8. The CanyonRock™ shall not be installed in locations that are susceptible to moisture penetration, such as, but not limited to bathrooms, pools, or spa enclosures.

B. General Conditions

1. The use of CanyonRock™ as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 27 day of April 2006.

3. Description

The MaxLiner™ Non-destructive Pipe Rehabilitation System (the "MaxLiner™ System") is intended for the rehabilitation of clay, poly vinyl chloride (PVC), and cast iron drainage pipes.

The MaxLiner™ System is an inversion system that allows the repair of drainage pipes by relining them in place. A custom designed liner tube made from either Max LinerTube™, Max FlexLiner™ or Max WovoLiner™, which is selected based on the existing pipe conditions, is impregnated with epoxy/resin, and is inverted through the existing pipes. The MaxLiner™ System may be installed by inserting the liner through basement drains, property line clean outs, small excavations, or roof drains.

The MaxLiner™ System can repair pipes from 75 mm (3") to 250 mm (10") in diameter, with lengths up to 60 m (200'), having a maximum bend up to 90^0.

Upon completion, the performance level of the restored pipe is not less than that which existed prior to the MaxLiner™ System being installed.

4. Authorization requested

The applicant sought a Building Materials Evaluation Commission (BMEC) authorization for the MaxLiner™ System as an alternative to repairing clay, PVC, and cast iron drainage pipes in existing buildings, as required by Article 7.1.2.2. “Alteration or Repair”, and Section 7.2. “Materials and Equipment” of the Building Code”, as amended or remade from time to time.

5. Assessment

Reports and assessments provided by the applicant show that if the MaxLiner™ System is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the Building Code will be provided.

The following is a list of the documents submitted, and reviewed, but are not limited to:

1. MaxLiner™ promotional DVD “Trench less Pipeline Rehabilitation”, May 2004.

2. MaxLiner™ “Liner Technical Data”.

26. Manufacturer’s Marketing Literature.

27. “Specification for Lateral Reconstruction of Sanitary Sewers by MaxLiner”

28. “Structural Calculation Inliner Type: RS HouseLiner, DN 150, 250", June 2001, Prof. Ing.-Buro Siebert.

29. Certificate “Development, Manufacture, and Distribution of Woolen Felts and Needled Felts for All Application in Industry, Production and Commerce”, December 2000.

30. Certificate, Vantico Ltd, CH-4002 Basel, registration number 10652-03, December 22, 2001.

6. Authorization

The use of the MaxLiner™ System is authorized as an alternative to repairing clay, PVC, and cast iron drainage pipes in existing buildings as required by Article 7.1.2.2. "Alteration or Repair", and Section 7.2. "Materials and Equipment" of the Building Code; all other requirements pertaining to the design, installation and construction are subject to the regulations of the Building Code, and to the following terms and conditions:

A. Specific Terms & Conditions

1. This authorization is valid only for MaxLiner™, LLC.

2. The MaxLiner™ System shall be installed by installers who are trained and approved by MaxLiner™, LLC.

3. The MaxLiner™ System may be used in single drainage pipe segments up to 60 m (200') in length.

4. The MaxLiner™ System may be used in pipes with bends up to 90 degrees.

5. Except as permitted in 6.A.6. of this authorization, the MaxLiner™ System shall only be used in pipe of 100 mm (4") to 200 mm (8") in diameter, having no side connection less than 100 mm (4") or greater than 200 mm (8") in diameter.

6. The MaxLiner™ System is permitted to be used in pipe of 75 mm (3"), and 250 mm (10") in diameter where there are no side connections.

7. The MaxLiner™ System shall not be installed in pipe that penetrates a fire separation.

8. The MaxLiner™ System shall not be used in a water supply system.

9. Materials, design and installation shall be in accordance with:

   (a) "Specification for Lateral Reconstruction of Sanitary Sewers by MaxLiner™, and

   (b) "Checklist for Renovation of Residential Lateral Using the MaxLiner™ System".

10. The MaxLiner™ System shall include a warranty certificate.

11. Non-removable stickers or labels, recording the following information, shall be posted in conspicuous locations at the cleanout(s) nearest to the repaired pipes:

(a) identifying MaxLiner™ System has treated the pipe(s),

(b) MaxLiner™ contact information,

©) a warning that the pipe has been coated with a liner, and

(d) a warning not to torch, not to solder, and to use pressure fittings only.

B. General Conditions

1. The use of the MaxLiner™ System as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

(b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(I) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(I) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

©) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 23 day of February 2006.

Authorization Report: Store-Rite Shelf and Rack Storage System

1. Applicant

Store-Rite Systems Inc.
6908 Invader Crescent
Mississauga, Ontario
L5T 2B5

Tel: 905 670 5121
Fax: 905 670 5920
Web: www.stor-rite.com

2. Manufacturing Facilities

Store-Rite Systems Inc.
6908 Invader Crescent
Mississauga, Ontario
L5T 2B5

3. Description

The Store-Rite shelf and rack storage system (the "shelf and rack storage system") is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment.

Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Building Code, as amended or remade from time to time and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Building Code.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for

Use and Occupancy

2.1 Except as where more restrictively provided for in 3.4. and 3.5. of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions; where the shelf and storage system incorporates the storage of rubber tires, such storage shall conform to the requirements of Subsection 3.3.1. “Indoor Tire Storage” of the Ontario Fire Code, Ontario Regulation 338/97, as amended or remade from time to time (the “OFC”),

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Building Code.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the OFC.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the Building Code.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) (i) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(ii) open construction consisting of steel grating or open steel floor planking.

(b) Deck and walkway levels in a structure used for the storage of Group A, B, and C plastic, as defined in NFPA 13-1999, and rubber tires, shall be constructed of steel decking as required in (a) (i) above.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Class I, II, III and IV commodities as defined in NFPA 13 -1999 as amended.

3.5 Where Class I, II, I II and IV commodities and Group A, B, C, plastics and rubber tires as defined in NFPA 13-1999 are stored, the maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 7 m.

3.6 Lighting levels of walkways and platforms shall conform to the Building Code.

3.7 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the Building Code.

3.8 Guards and toe boards shall be installed in accordance with the Building Code.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 “Emergency Planning” of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Building Code except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m^2 in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a “time-based egress analysis” undertaken and sealed by a Professional Engineer or Architect as defined in the Building Code using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the Building Code,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching ‘at-level’ conveyor cross-overs shall be marked in accordance with the Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the Store-Rite shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

(b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

   (d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 26 day of January 2006.

Fabrene Inc.
240 Dupont Road
North Bay, Ontario, P1B 5G6

Akita Covers
14625-122nd Avenue
Edmonton, Alberta, T5L 2W4

3. Description

The Calhoun Super Structure Building System is a non pressurized building, wherein the structure is composed of a steel framework to support the Calhoun Super Structure Membranes, which are tensioned to provide a weather barrier.

The steel frame structure of the Calhoun Super Structure Building System shall be designed and constructed in accordance with the Building Code. The steel framework is a series of in-line clear span frames, with or without end walls. The frame pieces are modular and are used in different arrangements to make a variety of profiles.

The Calhoun Super Structure Membranes are made of Fabrene RTGSW9W9 and Fabrene P708. The Calhoun Super Structure Membranes pieces are custom-sized and the edges reinforced for each building as per Calhoun Super Structure building system specifications.

The Calhoun Super Structure Membranes meet the requirements of a Class A material under ASTM E 84 Surface Burning Characteristics and satisfies the flammability requirements set out in CAN/ULC-S109 and NFPA 701-1999.

4. Authorization requested

The Applicant sought a Building Materials Evaluation Commission (the "BMEC") Authorization for the Calhoun Super Structure Membranes for use as roof coverings, only when used in conjunction with an unheated Calhoun Super Structure Building System, as defined in this Authorization, in lieu of the requirements of Sentence 3.1.15.1.(1). "Roof Covering Classification" of the Building Code.

5. Assessment

Reports and assessments provided by the Applicant show that if the Calhoun Super Structure Membranes are designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted and reviewed included, but were not limited to:

1. Bodycote Materials Testing Canada Inc. "NFPA 701-1999 Test 1 and Test 2 Flame Resistant Test of Woven Polyethylene Fabric", dated January 14, 2002.

2. Bodycote Materials Testing Canada Inc. "NFPA 701-2004 Test Method 2 - Flame Propagation of "RTGSW9W9" dated July 11, 2005.

3. Bodycote Materials Testing Canada Inc. "CAN/ULC-S109 Flame Resistant Test of Woven Polyethylene Fabric", dated January 14, 2002.

4. Bodycote Materials Testing Canada Inc. "ASTM E 84 Surface Burning Characteristics of 'Product P7081830' Woven Polyolefin" dated August 24, 2004.

5. Bodycote Materials Testing Canada Inc. "CAN/ULC-S102.2 Surface Burning Characteristics of 'Product P7081830' Woven Polyolefin'" dated August 24, 2004.

6. Intertek "CAN/ULC-S102.2-03 Standard Method of Test for Surface Burning Characteristics of Flooring, Floor Covering, and Miscellaneous Materials and Assemblies" dated July 7, 2005.

7. Bodycote Materials Testing Canada Inc."California Administrative Code Tile 19 Fire Resistance of 'P7081830' Woven Polyolefin.

8. Bodycote Materials Testing Canada Inc. "NFPA 701-1989 Large Scale Flame Resistance of M747 Woven Polyethylene Fabric", dated February 10, 2000.

9. Bodycote Materials Testing Canada Inc. "CAN/ULC-S109 Large-Flame Resistance of M747 Woven Polyethylene Fabric" dated February 10, 2000.

10. Bodycote Materials Testing Canada Inc. “ASTM E 84 Surface Burning Characteristics of Fabrene ‘M747' fabric” dated April 19, 2000.

11. Bodycote Materials Testing Canada Inc. “CAN/ULC-S102.2 Surface Burning Characteristics of Fabrene ‘M747' fabric” dated November 16, 2001.

12. Fabrene industrial Synthetic Fabric, Type P708 Specification Sheet and Fabrene Industrial Synthetic Fabric Type RTGSW9W9 (formerly M747) Specifications Sheets.

13. Canadian Commission on Building and Fire Code “Faxes Messages re: Fabric Covered Buildings for Cover-All Building Systems” dated February 15, 2002.

14. Proposed Change to the National Building Code (NBC) Document Application, by MSMA (Membrane Structures Manufactures Association), proposing a change to the NBC 1995 Article 3.1.15. “Roof Covering”.

15. Canadian General Standards Board “Certificate of Registration for Fabrene Inc. ISO 9001 - 2000", dated 2003/10/22.

16. Canadian Welding Bureau “Letter of Validation for Wellington manufacturing Inc.”, dated March 2, 2004 to March 2, 2006 and Steel Specifications Sheets for the Supporting Steels Frames.

17. Calhoun Super Structures Ltd. “Cover Letter and Site Specific Drawings for Susan Robinson Hay and Equipment Shed in Oshawa, Ontario” dated August 25, 2005.

18. Fabrene Quality Control Manual, dated 2003-06-04.

19. Akita Covers Ltd. Product Manual.

20. Calhoun Super Structure Manuals.

21. Calhoun Super Structure Engineer Reports.

6. Authorization

The Calhoun Super Structure Membranes are authorized for use as a roof coverings, only when used in conjunction with an unheated Calhoun Super Structure Building System, in lieu of the requirements of Sentence 3.1.15.1.(1) “Roof Covering Classification” of the Building Code; all other requirements pertaining to the installation and construction are subject to the requirements of the Building Code, and are subject to the following terms and conditions:

Note: This Authorization is not intended to be used as an equivalent to CAN/ULC-S107-M87 where roof coverings are permitted to be used in the construction of traditional roofing systems Class A, B, and C as determined by CAN/ULC-S107-M87.

A. Specific Terms & Conditions

1. This Authorization is valid only for the use of the Calhoun Super Structure Membranes, Fabrene RTGSW9W9 and Fabrene P708 when they are used in conjunction with a Calhoun Super Structure Building System.

2. In addition to the requirements of Article 2.3.1.1. of the Building Code, the structural design shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario) and who is experienced in the specific method applied.

3. When the Calhoun Super Structure Membranes are installed in conjunction with a Calhoun Super Structure Building System together they shall be constructed as per the requirements of Subsection 3.2.2. of the Building Code.

4. The Calhoun Super Structure Membranes used in the construction of Calhoun Super Structure Building System must be designed as structural members for snow and wind loads in accordance with the Building Code.

5. When the Calhoun Super Structure Membranes, used in the construction of a Calhoun Super Structure Building System, are designed without an end wall(s) additional wind loads shall be considered, such as internal pressure.

6. The Calhoun Super Structure Membranes are authorized for use only in buildings that are permitted to be of combustible construction.

7. Except as permitted by Article 3.2.2.17. of the Building Code, the Calhoun Super Structure Membranes shall not be used where the assembly is required to have a fire-resistance rating.

8. The Calhoun Super Structure Membranes are authorized for use in unheated building applications, when the Calhoun Super Structure Membranes are used in conjunction with a Calhoun Super Structure Building System.

9. The requirements of Article 2.1.1.11. of the Building Code need not be considered, when the Calhoun Super Structure Membranes are used in the construction of the Calhoun Super Structure Building System, for buildings that consumes energy at a rate less than 3.5 Btu/h•ft^2 under peak conditions.

10. The Calhoun Super Structure Membranes shall not be used in a building more than 1 storey in building height.

11. The Calhoun Super Structure Membranes shall not be used in the construction of Calhoun Super Structure Building System where the major occupancy is Group A, B, C, D, E or F Division 1, as defined by the Building Code.

12. The Calhoun Super Structure Membranes shall meet the following standards:

    a. CAN/ULC-S109-M87 "Standard for Flame Test of Flame-Resistant Fabrics and Films",

    b. NFPA 701-1999 or NFPA 701-2004 "Methods of Fire Test for Flame Propagation of Textiles and Films" Test 2, and

    c. CAN/ULC-S102.2-M2003 "Standard Method of Test for Surface Burning Characteristics of Flooring, Floor Covering, and Miscellaneous Materials and Assemblies."

13. The Calhoun Super Structure Membranes shall not have a flame spread rating more than 25, as specified in CAN/ULC-S102.2-M2003.

14. The Calhoun Super Structure Membranes shall be installed by installers who are approved by Calhoun Super Structure Ltd.

15. The Calhoun Super Structure Membranes shall be installed as per the Calhoun Super Structure Building System Installation Manuals, and are subject to the products' limitations as specified by the manufacturer.

16. The Calhoun Super Structure Membranes shall be identified by a permanent mark that indicates the manufacturer's name and registered trademark.

17. The Calhoun Super Structure Membranes used in the construction of Calhoun Super Structure Building System, shall have the spatial separation determined in accordance with the Building Code, where the roof membrane becomes a part of the exposing building face.

B. General Conditions

1. The use of the Calhoun Super Structure Membranes must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 24 day of November 2005.

AUTHORIZATION REPORT- Temo Roof Panels

1. Applicant

Temo Inc.
20400 Hall Road
Clinton Township, Michigan
USA, 48038

Tel: (586) 286-0410
Fax: (586) 226-1706
Web: www.temosunrooms.com

2. Manufacturing Facilities

Temo, Inc.
20400 Hall Road
Clinton Township, Michigan
USA, 48038

3. Description

The Temo Roof Panels may be used in the construction of unheated sunroom additions to residential occupancy buildings. The Temo Roof Panels were evaluated only as roof panels, and not as a decking surface.

TEMO ROOF PANELS			
Components	**Panel Size**		
	76 mm (3") panel	**108 mm (4.25") panel**	**153 mm (6") panel**
Aluminum	0.81 mm	0.81 mm	0.81 mm
OSB (top)	11.11 mm	11.11 mm	11.11 mm
Polystyrene Foam	76.2 mm	107.95	152.4 mm
OSB (bottom)	11.11 mm or 22.22 mm	11.11 mm or 22.22 mm	11.11 mm or 22.22 mm
Aluminum	0.81 mm	0.81 mm	0.81 mm
Adhesive Type	Ashland, or Rohm and Haas Note 1.	Ashland or Rohm and Haas Note 1.	Ashland, or Rohm and Haas Note 1.
Deflection Criteria	L/180	L/180	L/180

Note 1. The choice of adhesive may determine the span length of the panel.

The Temo Roof Panel components are laminated together using structural adhesives from either Ashland, or Rohm and Haas. The choice of adhesive may determine the span length of the panel. A solid wood member, 38 mm (2") wide and with a height cut-to-fit, extends around the perimeter of the Temo Roof Panels.

The Temo Roof Panels include a standing seam, also known as a metal cleat, to prevent water infiltration, and to maintain a continuous thermal barrier. In addition, the Temo Roof Panels may incorporate the use of a spline, to provide support.

4. Authorization requested

The Applicant sought a Building Materials Evaluation Commission (the "BMEC") Authorization for the use of the Temo Roof Panels for an unheated sunroom, which may be an addition to a residential occupancy building that are subject to the requirements of Part 9 of the Building Code.

5. Assessment

Reports and assessments provided by the Applicant show that if the Temo Roof Panels are designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted, and reviewed, but were not limited to:

27. Temo Roof Span Maximum Charts, dated November 11, 2005.

28. Intertek Testing Services, Report Number 3084194 “Standard Fire Test Program conducted on Two Composite Panels” dated October 6, 2005.

29. Terrapin Testing Inc., Report Number TT 50504-C, TEMO, Inc. “Laminate Sandwich Panel Tests Patio Roof Panels”, September 2, 2005.

30. Temo Sunrooms Inc. “Span Calculations: 76 mm panel, 108 mm panel, and 153 mm panel” dated November 1, 2005.

6. Authorization

The Temo Roof Panels are authorized for use as an innovative roof system designed for use in unheated sunrooms, which may be in an addition to a building of residential occupancy; all other requirements pertaining to the installation of the Temo Roof Panels shall be subject to the requirements of the Building Code, and are subject to the following terms and conditions.

A. Specific Terms & Conditions

1. This authorization is valid only for Temo Sunrooms Inc.

2. The structural design and general review of the Temo Roof Panels shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario); the Professional Engineer shall provide the chief building official with a document certifying that the installation conforms with this authorization.

3. The structural system supporting the authorized Temo Roof Panels shall have sufficient structural capacity as required by the Building Code.

4. The maximum allowable deflection of the Temo Roof Panels as an expressed ratio of the clear span shall be L/180.

5. As the Temo Roof Panels are used in unheated sunroom additions, the system need not meet the following Building Code requirements:

   (a) Subsection 9.25.2. “Thermal Insulation”, and Section 9.38. “Thermal Design”,

   (b) Subsection 9.25.3. “Air Barrier Systems”, and

   (c) Subsection 9.25.4. “Vapour Barriers”.

6. The use of the Temo Roof Panels shall be limited to residential occupancy buildings that are subject to the requirements of Part 9 of the Building Code.

7. The Temo Roof Panels shall not be used where the roof assembly is required to have a fire resistance rating.

8. The Temo Roof Panels shall incorporate the use of a metal cleat on the interior and the exterior side, having a minimum thickness of 0.38 mm (0.015").

9. The Temo Roof Panels shall be identified by a permanent stamp, sticker or mark indicating the manufacturer’s name or trademark.

10. If the Temo Roof Panels incorporate an opening within the panel, or is modified to accommodate a penetration within the panel, then additional testing demonstrating that the modified roof panel conforms to the Building Code shall be submitted to the chief building official for review.

B. GENERAL CONDITIONS

1. The use of the Temo Roof Panels must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

   (d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 24 day of November 2005.

AUTHORIZATION REPORT- The PowerShield Membranes

1. Applicant

Harnois Industries Inc.
1044 Principale St-Thomas
(Joliette), QC
J0K 3L0

Tel: (450) 756-1041
Fax: (450) 756-8389
Web: www.harnois.com

2. Manufacturing Facilities

Harnois Industries Inc.
1044 Principale St-Thomas
(Joliette), QC
J0K 3L0

Fabrene Inc.
240 Dupont Road
P.O Box 4040
North Bay, Ontario
P1B 5G6

3. Description

The Harnois MegaDome Building System is a non pressurized building, wherein the structure is composed of a steel framework to support the PowerShield Membranes, which are tensioned to provide a weather barrier.

The steel framework is a series of in-line clear span frames, with or without end walls. The frame pieces are modular and are used in different arrangements to make a variety of profiles. The steel frame structure of the Harnois MegaDome Building System shall be designed and constructed in accordance with the Building Code.

The PowerShield Membranes are made of a flame resistant woven polyolefin material: Fabrene M747, or Fabrene Type RTGSW9W9. The PowerShield Membranes pieces are custom-sized and the edges reinforced for each building as per Harnois Industries Inc. specifications.

The PowerShield Membranes meet the requirements of a Class A material under ASTM E 84 Surface Burning Characteristics and satisfies the flammability requirements set out in CAN/ULC-S109 and NFPA 701-2004.

4. Authorization requested

The Applicant sought a Building Materials Evaluation Commission (the "BMEC") Authorization for the PowerShield Membranes for use as a roof covering, only when used in conjunction with an unheated Harnois MegaDome Building System, as defined in this Authorization, in lieu of the requirements of Sentence 3.1.15.1.(1). "Roof Covering Classification" of the Building Code.

5. Assessment

Reports and assessments provided by the Applicant show that if the PowerShield Membranes are designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted and reviewed, but were not limited to:

1. Manufacturer's Information, Harnois MegaDome Building System.
2. Harnois MegaDome Building System PowerShield Designation.
3. Harnois MegaDome Building System Polyethylene and Polyefin Designation.
4. Harnois MegaDome Building System Snow Accumulation .
5. Les Industries Harnois QC, Canada "Physical Test on Fabrene Material".
6. Harnois MegaDome BMEC "Non Conformity Report".
7. NFPA 101 "Life Safety Code" Section 11.9.
8. NFPA 5000 "Building Construction and Safety Code™", Chapter 32, 2003 edition.
9. "International Building Code" Chapter 31, 2003 edition.
10. "The BOCA National Building Code" Section 3103.0., 1999 edition.
11. "Standard Building Code©" Chapter 31, 1997 edition.
12. "Uniform Building Code™" Volume 1, Section 3111, 1997 edition.
13. Harnois MegaDome Building System "Compliance with Part 5".
14. Bodycote Test Results CAN/ULC-S109 "Large-Flame Resistence of M747 Woven Polyethylene".

15. Bodycote Test Results CAN/ULC-S102 “Surface Burning Characteristics of M747".

17. Harnois Mega Dome Building System “Calculations”.

18. Letter of Validation, Canadian Welding Bureau.

19. Harnois MegaDome Building System “Quality Control”.

20. Harnois MegaDome Building System, Harnois R&D’ Dept.” Testing.

21. Manufacturer’s Information “GatorShield Tough”.

22. ASTM Designation A653/ A653M - 99 “Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process”.

23. Harnois “Steel Structure Warranty Certificate”.

24. Harnois “Poly PowerShield Warranty Certificate”.

25. Demo Booklet of Structural Engineering Calculations for Structures Used for Industrial Purposes”.

26. Demo Booklet of Structural Engineering Calculations for Structures Used for Agricultural Purposes.

27. Manual For SAFI 3D Structural Software Program.

28. Bodycote Materials Testing Canada Inc. NFPA 701-2004, July 11, 2005.

29. Harnois Engineer’s Letter, dated May 18, 2005.

30. Intertek Flame Spreads Test Program, CAN/ULC-S102.2-03, Report Number 3079762, July 15, 2005.

31. Harnois Engineer’s Letter, dated October 18, 2005.

32. Harnois MegaDome’s Worksheet, submitted October 18, 2005.

33. Harnois MegaDome HP-30 @ 4-0" “Demo Booklet”, submitted October 18, 2005.

34. Harnois MegaDome HP-80 @ 8-0" “Demo Booklet”, submitted October 18, 2005.

35. Example / Sample Calculations:

(a) Agricultural Application
(b) Megadome 125
(c) Stoneledge Farm
(d) Industrial Cold Storage Application
(e) Regina Equestrian Centre
(f) Megadome 125 - wind on end

6. Authorization

The PowerShield Membranes are authorized for use as roof coverings, only when used in conjunction with an unheated Harnois MegaDome Building System, in lieu of the requirements of Sentence 3.1.15.1.(1) "Roof Covering Classification" of the Building Code; all other requirements pertaining to the installation and construction are subject to the requirements of the Building Code, and are subject to the following terms and conditions:

Note: This Authorization is not intended to be used as an equivalent to CAN/ULC-S107-M87 where roof coverings are permitted to be used in the construction of traditional roofing systems Class A, B, and C as determined by CAN/ULC-S107-M87.

A. Specific Terms & Conditions

1. This Authorization is valid only for the use of the PowerShield Membranes, Fabrene M747, or Fabrene Type RTGSW9W9, when they are used in conjunction with a Harnois Mega Dome Building System.

2. In addition to the requirements of Article 2.3.1.1. of the Building Code, the structural design shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario) and who is experienced in the specific method applied.

3. When the PowerShield Membranes are installed in conjunction with a Harnois MegaDome Building System together they shall be constructed as per the requirements of Subsection 3.2.2. of the Building Code.

4. The PowerShield Membranes used in the construction of a Harnois MegaDome Building System must be designed as structural members for snow and wind loads in accordance with the Building Code.

5. When the PowerShield Membranes, used in the construction of a Harnois MegaDome Building System, are designed without an end wall(s) additional wind loads shall be considered, such as internal pressure.

6. The PowerShield Membranes are authorized for use only in buildings that are permitted to be of combustible construction.

7. Except as permitted by Article 3.2.2.17. of the Building Code, the PowerShield Membranes shall not be used where the assembly is required to have a fire-resistance rating.

8. The PowerShield Membranes are authorized for use in unheated building applications, when the PowerShield Membranes are used in conjunction with the Harnois MegaDome Building System.

9. When the PowerShield Membranes are used in the construction of Harnois MegaDome Building System, which consumes energy at a rate less than 3.5 $Btu/h \bullet ft^2$ under peak conditions, the requirements of Article 2.1.1.11. of the Building Code need not be considered.

10. The PowerShield Membranes shall not be used in a building more than 1 storey in building height.

11. The PowerShield Membranes shall not be used in the construction of Harnois MegaDome Building System where the major occupancy is Group A1, A2, B, C, D, E or F Division 1, as defined by the Building Code.

12. The PowerShield Membranes shall meet the following standards:

    a. CAN/ULC-S109-M87 “Standard for Flame Test of Flame-Resistant Fabrics and Films”,

    b. NFPA 701-2004 “Methods of Fire Tests for Flame Propagation of Textiles and Films” Test 2, and

    c. CAN/ULC-S102.2-03 “Standard Test Method for Surface Burning Characteristics of Building Materials.”

13. The PowerShield Membranes shall not have a flame spread rating more than 25, as specified in CAN/ULC-S102.2-M2003.

14. The PowerShield Membranes shall be installed by installers who are approved by Les Industries Harnois Inc.

15. The PowerShield Membranes shall be installed as per the Harnois MegaDome Building Installation Manuals, and are subject to the products’ limitations as specified by the manufacturer.

16. The PowerShield Membranes shall be identified by a permanent mark that indicates the manufacturer’s name and registered trademark.

17. The PowerShield Membranes used in the construction of Harnois MegaDome Building Systems, shall have the spatial separation determined in accordance with the Building Code, where the roof membrane becomes a part of the exposing building face.

B. General Conditions

1. The use of the PowerShield Membranes must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 24 day of November 2005.

Authorization Report - Shelf and Rack Storage Systems

1. Applicant

Metalsistem Canada Inc.
Storage and Display Solutions
55 West Beaver Creek Road, Unit 7
Richmond Hill, Ontario

Tel: (905) 886-9449
Fax: (905) 886-6890

2. Manufacturing Facilities

Metalsistem SPA.
Rovereto (TN)
Vial Dell'Industratria
Italy, 2

3. Description

The "Super 4, 5, 6," shelf and rack storage systems are self contained structural systems within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Building Code, as amended or remade from time to time and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of "Super 4, 5, 6" storage systems, as innovative shelf and rack storage systems designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack systems are used in accordance with the limitations and conditions stated in this authorization, they will provide the level of performance that would be achieved by conformance with the Building Code.

6. Authorization

The shelf and rack storage systems are authorized for use within a building as a self contained structural systems for material handling, storage and distribution, subject to the following terms and conditions:

Note: The BMEC did not evaluate the Metalsistem “Super 6 Series Mezzanines”, as the requirements for mezzanines may be found in the Building Code

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Metalsistem® Canada.

Use and Occupancy

2.1 Except as required by 3.4. of this authorization, the shelf and rack storage systems shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage systems are not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Building Code.

2.3 The shelf and rack storage systems shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time (OFC).

General

3.1 The structural components of the entire shelf and rack storage systems, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the Building Code.

3.2 The design and general review of the rack and storage systems shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage systems from the floor supporting the shelf and rack system to the topmost portion of the “Super 4" shelf and rack system shall not exceed 7 m , and 10 m when installing the “Super 5, and 6" shelf and rack system.

3.5 Lighting levels of walkways and platforms shall conform to the Building Code.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the Building Code.

3.7 Guards and toe boards shall be installed in accordance with the Building Code.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage systems are exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage systems are to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 “Emergency Planning” of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Building Code except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than three platform levels, the highest of which may not be more than 9 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Building Code using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)

V_p = Vertical travel distance on the shelf and rack storage (m)

H_m = Horizontal travel distance on the main floor (m)

N_{lg} = Number of lift gates in the means of egress

N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2). of the Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each 'at-level' conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the 'at-level' cross-over and all inserts shall be sized to support loads required in Part 4 of the Building Code,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each 'at-level' cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29 day of September 2005.

AUTHORIZATION REPORT - XLShelter Membrane

1. Applicant

All Cover Portable Systems/XLShelters
4664 Ontario Street
Beamsville, Ontario
N0G 1L0

Tel: (800) 282-1239
Fax: (905) 563-6367
Web: www.xlshelter.com

2. Manufacturing Facilities

Inland Plastics Ltd.
Box 2199
Drumheller, Alberta
T0J 0Y0

Layfield Geosynthetics and Industrial Fabrics Ltd.
11120 Silversmith Place
Richmond, British Columbia
V7A 5E4

3. Description

The XLShelter Building System is a non pressurized building, wherein the structure is composed of a steel framework to support the XLShelter Membrane which is tensioned to provide a weather barrier.

The steel framework is a series of in-line clear span frames, with end walls. The frame pieces are modular and are used in different arrangements to make a variety of profiles. The steel frame structure of the XLShelter Building System shall be designed and constructed in accordance with the Building Code.

The XLShelter Membrane is a flame resistant woven polyolefin material, FRU88X-6, 4 mil. The XLShelter Membrane pieces are custom-sized and the edges reinforced for each building as per XLShelter Building System specifications.

The XLShelter Membrane meets the requirements of a Class A material under ASTM E 84 Surface Burning Characteristics and satisfies the flammability requirements set out in CAN/ULC-S109 and NFPA 701-1996.

4. Authorization requested

The Applicant sought a Building Materials Evaluation Commission (the "BMEC") Authorization for the XLShelter Membrane for use as a roof covering, when used in conjunction with an unheated XLShelter Building System, as defined in this Authorization, in lieu of the requirements of Sentence 3.1.15.1.(1). "Roof Covering Classification" of the Building Code.

5. Assessment

Reports and assessments provided by the Applicant show that if the XLShelter Membrane is designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted and reviewed included, but were not limited to:

1. Inland Plastics Ltd. P2004-4 LDPE (Low Density) - FR, Manufacturer's Information, dated 2001.

2. Armorkote Membrane Structure Fabrics, FRU88X-6 data Sheet, Layfield Geosynthetics and Industrial Fabrics Ltd.

3. Inland Plastics Warranty.

4. All Cover Building Systems "Certified Engineering Drawings".

5. All Cover Building Systems "XLShelter Steel Framing Systems".

6. All Cover Building Systems "XLShelter Membranes as Roof Covering".

7. All Cover Building Cover Warranty.

8. Intertape Polymer Group "Manufacturing Quality Control - Certificate of Registration: ISO 9001-2000" .

9. International Building Code, Chapter 31 "Special Constructions".

10. ASTM D 5034, Standard Test Method for Breaking Stength and Elongation of Textile Fabric, re-approved in 2001.

11. ASTM D 5035, Standard Test Method for Breaking Force and Elongation of Textile Fabric, re-approved in 2003.

12. ASTM D 3786 - 01, Standard Test Method for Hydraulic Bursting Strength of Textile Fabrics.

13. ASTM D 2136 - 02 , Standard Test Method for Coated Fabrics - Low Temperature Bend.

14. ASTM D 2261, Tearing Strength of Fabric by the Tongue Procedure, re-approved in 2002.

15. CAN/CGSB-37.54-95 “Polyvinyl Chloride Roofing and Waterproofing Membrane”, dated May 1995.

16. Birdair, Technical Specifications and Fabric Characteristics.

17. All Cover / XL Shelter Building Systems, Assembly Instruction, 2005.

18. NFPA 701-1989 “Large Scale Flame Resistance of FRU88X-6 Fabric”, dated June 2000.

19. ASTM E 84 “Surface Burning Characteristics of FRU88X-6", dated June 2000.

20. Office of State Fire Marshal, California Department of Forestry and Fire Protection Office of the State Fire Marshal, “Registered Flame Resistant Product”.

21. CAN/ULC-S109 “Flame Resistance of FRU88X-6 Fabric”, dated June 2000.

22. Rowan Williams Davies and Irwin Inc. / Inland Plastic, Static Coefficient of Friction Tests Nova Shield Fabric, dated March 2004.

23. Bodycote Materials Testing Ortech Laboratories / Layfield Group, “NFPA 701-1989 Large Scale Flame Resistance of FRU88X-6 Fabric”, dated June 2000.

24. Bodycote Materials Testing Ortech Laboratories / Layfield Group ASTM E 84, “Surface Burning Characteristics of FRU88X-6 Fabric”, dated June 2000.

25. Inland Plastics Ltd. Material Safety Data Sheet, dated 2001.

26. Live Load Case Study for XLShelter Membranes, dated August 31, 2005.

27. Bodycote Materials Testing Canada Inc. “NFPA 701-1996 Test 1 and Test 2 Flame Resistance of FRU88X-6”, dated September 6, 2001.

28. Acceptance by other Jurisdictions:

(a) Development Services Commission, Markham, Ontario: Non Housing Building Permit, dated 2004.
(b) Building Permit issued by the City of North Bay, 2004.
(c) Building Permit (04-122264), Toronto Urban Development Services.
(d) Certified Plan (02-55028), Toronto Urban Development Services.
(e) Permit (Project# 05-000745 TS) issued by the City of St. Catharines.
(f) Permit (Project# 05-000770 TS) issued by the City of St. Catharines.

6. Authorization

The XLShelter Membrane is authorized for use as a roof covering, only when used in conjunction with an unheated XLShelter Building, in lieu of the requirements of Sentence 3.1.15.1.(1) "Roof Covering Classification" of the Building Code; all other requirements pertaining to the installation and construction are subject to the requirements of the Building Code, and are subject to the following terms and conditions:

Note: this Authorization is not intended to be used as an equivalent to CAN/ULC-S107-M87 where roof coverings are permitted to be used in the construction of traditional roofing systems Class A, B, and C as determined by CAN/ULC-S107-M87.

A. Specific Terms & Conditions

1. This Authorization is valid only for the use of the XLShelter Membrane FRU88X-6, when it is used in conjunction with an XLShelter Building System.

2. In addition to the requirements of Article 2.3.1.1. of the Building Code, the structural design shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario) experienced in the specific method applied.

3. When the XLShelter Membrane is installed in conjunction with an XLShelter Building System, together they shall be constructed as per the requirements of Subsection 3.2.2. of the Building Code.

4. The XLShelter Membrane used in the construction of an XLShelter Building System must be designed in accordance with Subsections 4.1.7. and 4.1.8. of the Building Code.

5. The XLShelter Membrane is authorized for use only in buildings that are permitted to be of combustible construction.

6. Except as permitted by Article 3.2.2.17. of the Building Code, the XLShelter Membrane shall not be used where the assembly is required to have a fire-resistance rating.

7. The XLShelter Membrane is authorized for use in unheated building applications, when the XLShelter Membrane is used in conjunction with an XLShelter Building System.

8. The requirements of Article 2.1.1.11. of the Building Code need not be considered, when the XLShelter Membrane is used in conjunction with an XLShelter Building System, for buildings that consume energy at a rate less than 3.5 Btu/h•ft^2 under peak conditions.

9. The XLShelter Membrane shall not be used in a building more than 1 storey in building height.

10. The XLShelter Membrane shall not be used in the construction of the XLShelter Building System where the major occupancy is Group A, B, C, D, E or F Division 1, as defined by the Building Code.

11. The XLShelter Membrane shall meet the following standards:

    a. CAN/ULC-S109-M87 “Standard for Flame Tests of Flame-Resistant Fabrics and Films”,

    b. NFPA 701-1996 “Standard Methods of Fire Tests for Flame-Resistance of Textiles and Films”, Test 1 and Test 2, and

    c. CAN/ULC-S102.2-M2003 “Standard Method of Test for Surface Burning Characteristics of Flooring, Floor Covering, and Miscellaneous Materials and Assemblies.”

12. The XLShelter Membrane shall not have a flame spread rating more than 25, as specified in CAN/ULC-S102.2-M2003.

13. The XLShelter Membrane shall be installed by installers who are approved by All Cover Portable Systems/XLShelters.

14. The XLShelter Membrane shall be installed as per the XLShelter Building System Installation Manuals, and are subject to the product’s limitations as specified by the manufacturer.

15. The XLShelter Membrane shall be identified by a permanent mark that indicates the manufacturer’s name and registered trademark.

16. The XLShelter Membrane used in the construction of XLShelter Building System, shall have the spatial separation determined in accordance with the Building Code, where the roof membrane becomes a part of the exposing building face.

B. General Conditions

1. The use of the XLShelter Membrane must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29 day of September 2005.

Authorization Report: Arencon - Shelf and Rack Storage System

1. Applicant

Arencon
1551 Caterpillar Road
Suite 103
Mississauga, Ontario
L4X 2Z6

Tel: (905) 615 -1774
Fax: (905) 615 -9351

2. Manufacturing Facilities

1551 Caterpillar Road
Suite 103
Mississauga, Ontario
L4X 2Z6

3. Description

The Arencon shelf and rack storage system (the "shelf and rack storage system") is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment.

Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Building Code, as amended or remade from time to time and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Building Code.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Arencon.

Use and Occupancy

2.1 Except as where more restrictively provided for in 3.4. and 3.5. of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions; where the shelf and storage system incorporates the storage of rubber tires, such storage shall conform to the requirements of Subsection 3.3.1. “Indoor Tire Storage” of the Ontario Fire Code, Ontario Regulation 338/97, as amended or remade from time to time (the “OFC”),

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Building Code.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the OFC.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the Building Code.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) (i) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(ii) open construction consisting of steel grating or open steel floor planking.

(b) Deck and walkway levels in structure use for the storage of Group A, B, and C plastic, as defined in NFPA 13-1999, and rubber tires, shall be constructed of steel decking as required in (a) above.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Class I, II, III and IV commodities as defined in NFPA 13 -1999 as amended.

3.5 Where Class I, II, I II and IV commodities and Group A, B, C, plastics and rubber tires as defined in NFPA 13-1999 are stored, the maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 7 m.

3.6 Lighting levels of walkways and platforms shall conform to the Building Code.

3.7 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the Building Code.

3.8 Guards and toe boards shall be installed in accordance with the Building Code.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 "Emergency Planning" of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Building Code except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Building Code using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:
- H_p = Horizontal travel distance on the shelf and rack storage (m)
- V_p = Vertical travel distance on the shelf and rack storage (m)
- H_m = Horizontal travel distance on the main floor (m)
- N_{lg} = Number of lift gates in the means of egress
- N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a "positive lock" when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where 'at-level' conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two 'at-level' conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the 'at-level' cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each 'at-level' conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the 'at-level' cross-over and all inserts shall be sized to support loads required in Part 4 of the Building Code,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each 'at-level' cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.
2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

   (d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29 day of September 2005.

BMEC Authorization	# 05-10-314
BMEC Application	# A2004-12

AUTHORIZATION REPORT- Cayuga (washed) High Performance Bedding™

1. Applicant

Dufferin Aggregates.
2300 Steeles Avenue West, Suite 400
Concord, Ontario
L4K 5X6

Tel: (905) 761-7500
Fax: (905) 761 7505

2. Manufacturing Facilities

Cayuga Quarry
511 Hwy#3 RR#4
Cayuga, Ontario, N0A 1E0

3. Description

The Dufferin Aggregates Cayuga (washed) High Performance Bedding™ (the "Cayuga (washed) HPB™") is a limestone aggregate non-uniformly graded gravel offering a 9.5 mm top size. The Cayaga (washed) HPB™ is a crushed, washed, and graded aggregate; and is manufactured at the Cayuga Quarry.

4. Authorization requested

The applicant sought an Authorization for the use of the Cayuga (washed) HPB™ as an acceptable alternative that satisfies the granular material requirements for applications beneath floors, and on the top and sides of drain pipes and tile as it is required by the provisions of the Building Code, as amended (the "Building Code").

The applicant requested an equivalent to the requirements of Sentences 9.14.2.1.(2), 9.14.3.3.(4), and 9.16.2.1.(1) of the Building Code.

5. Assessment

Reports and assessments provided by the applicant demonstrate that if the Cayuga (washed) HPB™ is manufactured, stored, installed, maintained and monitored in accordance with the limitations of the manufacturer's specifications and the conditions stated in this Authorization, a level of performance equivalent to that required by Sentences 9.14.2.1.(2), 9.14.3.3.(4), and 9.16.2.1.(1) of the Building Code will be provided.

The reports submitted and reviewed, but were not limited to:

1. Manufacturer's literature "HPB - High Performance Bedding"

2. Peto MacCallum Ltd. Consulting Engineers, re: Oringinal Rpert: Comparative Evaluation of Pipe Bedding Stones for Acceptance by the City of Mississauga , Revised Report: Comparative Evaluation of Granular Materials for acceptance by the Ontario Building Code, Ref #.:8TE088(R), issued April 10, 1988, and revised on October 28, 2004.

3. Portable Demonstration Model Images.

4. Application to the Building Materials Evaluation Commission, submitted by Dufferin Aggregates, March 11, 2002.

5. Dufferin Aggregates Power Point Presentation, March 27, 2002.

6. Application to the Building Materials Evaluation Commission, submitted by Dufferin Aggregates, June 23, 2003.

7. Peto MacCallum Ltd. Re: Flow Rate/Permeability Testing of High Performance Bedding (H.P.B) , ref# 03TE061A, materials from Acton Quarry, dated September 11, 2003.

8. Decision of the Building Materials Evaluation Commission, submitted by Dufferin Aggregates, November 5, 2003.

9. Application for "OACETT Honours Awards 2002 - 2003"

10. Building Materials Evaluation Commission Authorization #02-08-279.

11. Dufferin Aggregates Quality Control Manual: Aberfolye Pit.

12. Dufferin Aggregates Quality Control Manual: Acton Quarry.

13. Dufferin Aggregates Quality Control Manual: Cayuga Quarry.

14. Dufferin Aggregates Quality Control Manual: Mill Creek Pit.

15. Dufferin Aggregates Quality Control Manual: Milton Quarry.

16. ASTM Standard D 75 - 97 “Standard Practice for Sampling Aggregates.

17. Peto MacCallum Ltd. Consulting Engineers, re: Partial Report - Comparative Evaluation of Granular Material, revised February 14, 2005,ref # 03TE61B.

18. Peto MacCallum Ltd. Consulting Engineers, “Comparative Evaluation of Granular Materials”, revised October 28, 2004, ref # 0TE088(R).

19. Letter of recommendation, Unilock, dated May 16, 2002.

20. Letter of recommendation, Mid-North Excavating, dated June 11, 2002.

21. Letter of recommendation, Maxwell Excavating Limited, dated July 23, 2001.

22. Letter of Approval, Regional Municipality of Peel, Public Works, dated August 24, 1994.

23. Letter of Approval, City of Mississauga, Department of Transportation and Works, dated August 17, 1994.

24. Dufferin Aggregates submission, June 24, 2005.

25. Dufferin Aggregates submission, July 28, 2005.

26. Peto MacCallum Ltd. Consulting Engineers letter re: BMEC Application A2004-12: Dufferin Aggregates” dated January 3, 2005, ref # 03TE061B.

27. Dufferin Aggregates Quality Control Lab Manual from all Dufferin Aggregate Sites and Cayuga Materials.

6. Authorization

The Dufferin Aggregates Cayuga (washed) HPB™ is authorized for use as a granular material as referenced in Sentences 9.14.2.1.(2), 9.14.3.3.(4) and 9.16.2.1.(1) of the Building Code, when the Cayuga (washed) HPB™ is manufactured, stored, installed, maintained and monitored in accordance with the limitations of the manufacturer's specifications and recommendations; and the following terms and conditions:

A. Specific Terms and Conditions

1. This authorization is valid only for Dufferin Aggregates Cayuga (washed) HPB™ manufactured at the facilities referenced in Section 2. of this Authorization.

2. The Cayuga (washed) HPB™ shall be manufactured and stored as per Dufferin Aggregates Quality Control Manuals.

3. The Cayuga (washed) HPB™ shall be a well graded material that does has not more than 15% passing a #4 sieve, and not more than 10% passing a #8 sieve.

4. The Cayuga (washed) HPB™ is authorized for use as a granular material as referenced in Sentences 9.14.2.1.(2) and 9.14.3.3.(4) of the Building Code.

5. The Cayuga (washed) HPB™ is authorized for use as a granular material as referenced in Sentence 9.16.2.1.(1) of the Building Code.

6. When the Cayuga (washed) HPB™ is used on the top and sides of a drain tile or pipe, the drain tile or pipe shall be wrapped in a geo-textile material.

7. A signed copy of the quarry ticket, for each shipment received shall be kept with the on-site construction documents, and upon request produced to the authority having jurisdiction.

8. The Dufferin Aggregates quarry ticket, as required by 6.A.7. of this authorization, must indicate the following minimum information:

   (a) Name of the Quarry
   (b) Date,
   (c) Ticket number,
   (d) Gross and net amount of the HPB™ product,
   (e) Name of the product “Cayuga (washed) HPB™”, and
   (f) BMEC Authorization #.

9. The Cayuga (washed) HPB™ is not authorized for applications pertaining to Part 8 “Sewage Systems” of the Building Code.

10. The Cayuga (washed) HPB™ is not authorized for use when designed, or installed in combination with other aggregates.

B. General Conditions

1. The use of the Dufferin Aggregates Cayuga (washed) HPB™ as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act,* 1992 (the “BCA”) as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

(b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

i. the material, system or building design that is the subject matter of this Authorization;

ii. the address of the Applicant specified in Part 1 of this Authorization; or,

iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29 day of September 2005.

BMEC Authorization	# 05-09-313
BMEC Application	# A2005-14

Authorization Report: Rack Net-Works - Shelf and Rack Storage System

1. Applicant

2005840 Ontario Inc.
o/a Rack Net-Works
1403 Malibou Terrace
Mississauga, Ontario
L5J 4B9

Tel: (905) 361-7676
Fax: (416) 352-1437

2. Manufacturing Facilities

Rack Net-Works
1403 Malibou Terrace
Mississauga, Ontario
L5J 4B9

3. Description

The Rack Net-Works shelf and rack storage system (the "shelf and rack storage system") is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment.

Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Building Code, as amended or remade from time to time and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Building Code.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Rack Net-Works.

Use and Occupancy

2.1 Except as where more restrictively provided for in 3.4. and 3.5. of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions; where the shelf and storage system incorporates the storage of rubber tires, such storage shall conform to the requirements of Subsection 3.3.1. “Indoor Tire Storage” of the Ontario Fire Code, Ontario Regulation 338/97, as amended or remade from time to time (the “OFC”),

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Building Code.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the OFC.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the Building Code.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Class I, II, III and IV commodities as defined in NFPA 13 -1999 as amended.

3.5 Where Class I, II, I II and IV commodities and Group A, B, C, plastics and rubber tires as defined in NFPA 13-1999 are stored, the maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 7 m.

3.6 Lighting levels of walkways and platforms shall conform to the Building Code.

3.7 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the Building Code.

3.8 Guards and toe boards shall be installed in accordance with the Building Code.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 "Emergency Planning" of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Building Code except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Building Code using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)

V_p = Vertical travel distance on the shelf and rack storage (m)

H_m = Horizontal travel distance on the main floor (m)

N_{lg} = Number of lift gates in the means of egress

N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the required Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the Building Code,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching ‘at-level’ conveyor cross-overs shall be marked in accordance with the required Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

   (d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 25 day of August 2005.

AUTHORIZATION REPORT- The Envirotech Membrane

1. Applicant

Storage Systems Construction Corp.
20 Shamrock Rock, Unit #8
Erin, Ontario
N08 1T0

Tel: (519) 833-0054
Fax: (519) 363-0085

2. Manufacturing Facilities

Storage Systems Construction Corp.
20 Shamrock Rock, Unit #8
Erin, Ontario
N08 1T0

PGI Fabrene
240 Dupont Road
North Bay, Ontario
P1B 5G6

3. Description

The Storage Systems Construction Corp.'s building system is a non pressurized building, wherein the structure is composed of a steel framework to support the Envirotech Membrane, which is tensioned to provide a weather barrier.

The steel frame structure of the Storage Systems Construction Corp.'s building system shall be designed and constructed in accordance with the Building Code. The steel framework is a series of in-line clear span frames, with end walls. The frame pieces are modular and are used in different arrangements to make a variety of profiles.

The Envirotech Membrane is made of two flame resistant woven polyolefin materials, Type P708. The Envirotech Membrane pieces are custom-sized and the edges reinforced for each building as per Storage Systems Construction Corp.'s building system specifications.

The Envirotech Membrane meets the requirements of a Class A material under ASTM E 84 Surface Burning Characteristics and satisfies the flammability requirements set out in CAN/ULC-S109 and NFPA 701-1999.

4. Authorization requested

The Applicant sought a Building Materials Evaluation Commission (the "BMEC") Authorization for the Envirotech Membrane for use as a roof covering, only when used in conjunction with an unheated Storage Systems Construction Corp.'s building system, as defined in this Authorization, in lieu of the requirements of Sentence 3.1.15.1.(1). "Roof Covering Classification" of the Building Code.

5. Assessment

Reports and assessments provided by the Applicant show that if the Envirotech Membrane is designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted and reviewed, but were not limited to:

1. Storage Systems Construction Corp. "Envirotech Structures" Fabric Arch Storage Buildings: Specifications - High Profile 60'.

2. Storage Systems Construction Corp. "Envirotech Structures" Fabric Arch Storage Buildings: Specifications - Standard Profile 50'/60'/70'/80'/100'/.

3. Storage Systems Construction Corp. Envirotech Fabric/Arch Storage Building Warranty.

4. Certificate of Authorization: Storage Systems Construction Corp.

5. Triodem Laboratory Report: Neutral Salt Stray Test (ASTM B117).

6. Fabrene Industrial Synthetic Fabrics: Type P708 - Specifications.

7. PGI Fabrene "Quality Assurance Manual".

8. Fabrene Inc. Certificate of Registration ISO 9001: 2000.

9. NFPA 701 "Standard Methods of Fire Tests for Flame Propagation of Textiles and Films", 2004 Edition.

10. Bodycote Material Testing Report 04-020657 (B): ASTM E84 "Surface Burning Characteristics", Product P7081830.

11. Bodycote Test Results 01-02-827(B) CAN/ULC-S109 "Large-Flame Resistence of M747 Woven Polyethylene".

12. Bodycote Test Results 04-02-657(A) CAN/ULC-S102 "Surface Burning Characteristics of M747".

13. Bodycote Test Results 01-02-827(A) NFPA 701-1999 Test 1 and Test 2 “Flame Resistance Test of Woven Polyethylene Fabric”.

14. “International Building Code” Chapter 31, 2003 edition.

15. Storage Systems Construction Corp. “Snow Load Calculations”, May 12, 2005.

16. Acceptance by Other Jurisdictions:

    (a) The Corporation of the Township of Wilmot
    (b) Ministry of Transportation, Ontario

17. Contracts and Awards:

    (a) SSCC 115-703 Drawing L01
    (b) Goulais River
    (c) 106-704 Drawing L01
    (d) SSB-059321
    (e) 104-704 Drawing L01
    (f) SSB-059280
    (e) SSCC 102-704

6. Authorization

The Envirotech Membrane is authorized for use as a roof covering, only when used in conjunction with an unheated Storage Systems Construction Corp.’s building system, in lieu of the requirements of Sentence 3.1.15.1.(1) “Roof Covering Classification” of the Building Code; all other requirements pertaining to the installation and construction are subject to the requirements of the Building Code, and are subject to the following terms and conditions:

Note: this Authorization is not intended to be used as an equivalent to CAN/ULC-S107-M87 where roof coverings are permitted to be used in the construction of traditional roofing systems Class A, B, and C as determined by CAN/ULC-S107-M87.

A. Specific Terms & Conditions

1. This Authorization is valid only for the use of the Envirotech Membrane, Type P708 when it is used in conjunction with a Storage Systems Construction Corp.’s building system.

2. In addition to the requirements of Article 2.3.1.1. of the Building Code, the structural design shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario) and who is experienced in the specific method applied.

3. When the Envirotech Membrane is installed in conjunction with a Storage Systems Construction Corp.'s building system together they shall be constructed as per the requirements of Subsection 3.2.2. of the Building Code.

4. The Envirotech Membrane used in the construction of Storage Systems Construction Corp.'s building system must be designed in accordance with Subsections 4.1.7., and 4.1.8. of the Building Code.

5. The Envirotech Membrane is authorized for use in combustible construction only.

6. Except as permitted by Article 3.2.2.17. of the Building Code, the Envirotech Membrane shall not be used where the assembly is required to have a fire-resistance rating.

7. The Envirotech Membrane is authorized for use in unheated building applications, when the Envirotech Membrane is used in conjunction with a Storage Systems Construction Corp.'s building system.

8. The requirements of Article 2.1.1.11. of the Building Code need not be considered, when the Envirotech Membrane is used in the construction of the Storage Systems Construction Corp.'s building system, for buildings that consumes energy at a rate less than 3.5 Btu/h•ft^2 under peak conditions.

9. The Envirotech Membrane shall not be used in a building more than 1 storey in building height.

10. The Envirotech Membrane shall not be used in the construction of Storage Systems Construction Corp.'s building system where the major occupancy is Group A, B, C, D, E or F Division 1, as defined by the Building Code.

11. The Envirotech Membrane shall meet the following standards:

    a. CAN/ULC-S109-M87 "Standard for Flame Test of Flame-Resistant Fabrics and Films",

    b. NFPA 701-1999 "Methods of Fire Test for Flame Propagation of Textiles and Films" Test 2, and

    c. CAN/ULC-S102.2-M2003 "Standard Method of Test for Surface Burning Characteristics of Flooring, Floor Covering, and Miscellaneous Materials and Assemblies."

12. The Envirotech Membrane shall not have a flame spread rating more than 25, as specified in CAN/ULC-S102.2-M2003.

13. The Envirotech Membrane shall be installed by installers who are approved by Storage Systems Construction Corp.

14. The Envirotech Membrane shall be installed as per the Storage Systems Construction Corp.'s building system Installation Manuals, and are subject to the products' limitation as specified by the manufacturer.

15. The Envirotech Membrane shall be identified by a permanent mark that indicates the manufacturer's name and registered trademark.

16. The Envirotech Membrane used in the construction of Storage Systems Construction Corp.'s building system, shall have the spatial separation determined in accordance with Subsections 3.2.3. or 9.10.14. of the Building Code, where the roof membrane becomes a part of the exposing building face.

B. General Conditions

1. The use of the Envirotech Membrane must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary

Dated at Toronto this 28 day of July 2005.

Authorization Report: Home Slicker™

1. Applicant

Benjamin Obdyke Incorporated
199 Precision Drive
Horsham, PA
19044, USA

Tel: (215) 672-7200
Fax: (215) 672-5204
Web: www.benjaminobdyke.com

2. Manufacturing Facilities

Colbond
1301 Sand Hill Road
Enka, NC
28728, USA

3. Description

The Home Slicker™ is a 6.35 mm (0.25 inches) thick non-absorbent 3-dimensional matrix, which is composed of extruded Nylon 6 filaments randomly oriented to form an open drainage material with a sinusoidal-shaped cross section.

The Home Slicker™ is mechanically fastened to create an additional optional layer between the cladding and the sheathing membrane.

The primary application of the Home Slicker™ is as an optional additional component of a cladding system. Home Slicker™ would be installed to increase performance in regard to the redirection of potential penetrating water and to the ventilation drying of exterior cladding.

4. Authorization Requested

The Applicant sought authorization for the use the Home Slicker™ as an optional additional layer of a cladding system within the scope of Part 9 of the Building Code.

5. Assessment

Reports and assessments provided by the applicant show that if Home Slicker™ is designed, performance tested, installed and maintained in accordance with the limitations in the manufacturer's instructions and the conditions stated in this authorization, the level of performance required by the Building Code will be provided.

The reports submitted and reviewed, but were not limited to the following:

1. Code Compliance Report, prepared by Morrison Hershfield, November 2, 2004.

2. Colbond, Inc. Quality Control/Assurance Manual “Home Slicker & Cedar Breather” Products Manufactured for Benjamin Obdyke Inc.

3. Nova Scotia Home Builder Association “ Builder/Renovator Alert Halifax Regional Municipality”, October 7, 2005.

4. Bodycote Materials Testing Canada “Thickness, Density and Compressive Properties of Home Slicker Rainscreen”, February 25, 2002.

5. Precision Geosynthetic Laboratories “Verification of Material Properties”, April 30, 2002.

6. SGS US Testing Co. “ASTM D4632 and ASTM D433", October 14, 2003.

7. Bodycote Materials Testing Canada “ASTM E 84 Surface Burning Characteristics “Home Slicker™” Sheathing Material”, March 11, 2002.

8. Precision Geosynthetic Laboratories “ASTM D4716", February 27, 2002.

9. Architectural Testing “Performance Test Report”, July 16, 2004.

10. Bodycote Materials Testing Canada “Air Flow Characteristics of a Typical Exterior Wall Cavity Created using Home Slicker®”, July 2, 2002.

11. Certianteed “Report: Wind Loading Test”, January 23, 2003.

12. SGS US Testing Co. “ASTM E-732", December 5, 2002.

13. NRC/CNRC Client Report “Thermal Properties Determination of Home Slicker Drainage Plane Matte and An Air Layer of the Same Thickness in Both Horizontal and Vertical Positions” March 17, 2004.

14. Architectural Testing “Performance Test Report”, October 1, 2004.

15. Manufacturer’s Information “Home Slicker™: How Exterior Walls Stay Dry on the Inside.”

16. Manufacturer’s Information “Home Slicker™: How Exterior Walls Stay Dry on the Inside - Application and Architectural Drawings.”

17. Engineering Letter, CertianTeed Corporation, January 23, 2003.

18. SGS® U.S. Testing Company Inc., Test Report 173140-6, December 5, 2002.

6. Authorization

The Home Slicker™ is authorized as part of an optional additional layer in a cladding system within the scope of Part 9 of the Building Code; all other requirements pertaining to the construction and installation are subject to the requirements of the Building Code, and are subject to the following specific terms and conditions of this Authorization:

A. Specific Terms and Conditions

1. This Authorization is valid only for Benjamin Obdyke Incorporated.

2. The Home Slicker™shall only used be in conjunction with those cladding materials listed in Articles 9.27.1.1. and 9.27.1.2. of the Building Code.

3. The Home Slicker™ was not evaluated for use with propriety wall assemblies such as exterior insulation and finish systems (EIFS), or insulated concrete form (ICFs), above or below grade.

4. The Home Slicker™shall be installed as per the manufacturer's installation instructions, as they apply to those claddings listed in Articles 9.27.1.1. and 9.27.1.2. of the Building Code.

5. The Home Slicker™ shall not be used in a wall assembly, when the assembly is required to be of noncombustible construction.

B. General Conditions

1. The use of the Home Slicker™ must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (the "BCA") and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1 of this authorization; or,

(iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 28 day of July 2005.

Authorization Report: Delta® Drainwrap

1. Applicant

Cosella-Dorken Products Inc.
4655 Delta Way
Beamsville, Ontario
L0R 1B4

Tel: (905) 563-3255
Fax: (905) 563-5582
Web: www.cosella-dorken.com

2. Manufacturing Facilities

Cosella-Dorken Products Inc.
4655 Delta Way
Beamsville, Ontario
L0R 1B4

3. Description

The Delta® Drainwrap is a 0.6 mm thick high-density polyethylene sheet product with dimpled profile having an overall thickness of about 7 mm. The dimples are located 41 mm on centre, in rows half that distance apart. Each dimple provides an approximate 6 mm high space on its convex side, and is connected in four directions to adjacent dimples by channels approximately 3 mm high.

The Delta® Drainwrap sheet may be overlapped with dimples and channels on one sheet interlocking with the corresponding portions on the other sheet. When installed as spacing between siding and sheathing, the product creates a continuous uninterrupted series of ventilation passageways on both sides.

The Delta® Drainwrap is intended to be used as a ventilated exterior wall cladding spacer and as a ventilating spacer for wall assemblies. The Delta® Drainwrap is not intended to replace the need for application of an air or vapour barrier.

4. Authorization Requested

The applicant sought authorization for the use the Delta® Drainwrap as an alternative to "Breathable Type Sheathing Paper" as required in Sentence 9.23.17.1.(1) of the Building Code.

5. Assessment

Reports and assessments provided by the applicant show that if Delta® Drainwrap is designed, performance tested, installed and maintained in accordance with the limitations in the manufacturer's instructions and the conditions stated in this authorization, the level of performance required by the Building Code will be provided.

The reports submitted and reviewed, but were not limited to the following:

1. University of Waterloo, Building Engineer Group “Delta® Drainwrap System: Drying & Drainage Study” April 2005.

2. Oak Ridge National Laboratory “Hygrothermal Performance Report”.

3. Larden Muniak Letter Report “Equivalency of Delta® Drainwrap System to Sheathing Membranes Regulated by OBC 9.23.17.1".

4. Cosella-Dorken Products Inc., Delta® Structure Drain Product Drawings.

5. Delta®-Structure Drain - Installation Guidelines and Drawings.

6. Manufacturer’s Information “Self Adhesive Flashing”.

7. Delta® - Drainwrap Product Warranty.

8. University of Waterloo, Building Engineer Group letter re: Delta DrainWrap, dated June 13, 2005.

6. Authorization

The Delta® Drainwrap is authorized for use in lieu of sheathing paper as it is required by Sentence 9.23.17.1.(1) of the Building Code; all other requirements pertaining to the construction and installation are subject to the requirements of the Building Code, and are subject to the following specific terms and conditions of this Authorization:

A. Specific Terms and Conditions

1. This Authorization is valid only for Cosella Dorken Products Inc.

2. The Delta® Drainwrap shall only used be in conjunction with those cladding materials listed in Articles 9.27.1.1. and 9.27.1.2. of the Building Code.

3. The Delta® Drainwrap was not evaluated for use with propriety wall assemblies such as exterior insulation and finish systems (EIFS), or insulated concrete forms (ICFs), above or below grade.

4. The Delta® Drainwrap shall be installed as per the manufacturer’s installation instructions, as they apply to those claddings listed in Articles 9.27.1.1. and 9.27.1.2. of the Building Code.

5. The Delta® Drainwrap shall not be used in a wall assembly, when required to be of noncombustible construction.

6. A wall assembly incorporating the Delta® Drainwrap shall utilize a vapour barrier having a permeance not greater than 15 ng/(pa•s•m^2).

7. Details illustrating the method in which the Delta® Drainwrap will be installed to resist the migration and penetration of water behind the Delta® Drainwrap and around openings (e.g. windows, doors, vent stacks...) shall be submitted to the authority having jurisdiction for review and approval.

8. Details illustrating the method in which the Delta® Drainwrap will be installed ensuring that good ventilation –clear and continuous openings at the top and bottom– and drainage is provided shall be submitted to the authority having jurisdiction for review and approval.

9. Cladding shall be installed in such a manner so as to maintain its integrity as well as the required drainage on both sides of the Delta® Drainwrap, and be attached securely to the building.

B. General Conditions

1. The use of the Delta® Drainwrap must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (the "BCA") and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

(i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 28 day of July 2005.

Authorization Report: AQUASAFE® Multipurpose Residential Sprinkler System

1. Applicant

Uponor Canada Inc.
655 Park Street
Regina, Sask
S4N 5N1

Tel: (306) 791-3356
Fax: (306) 721-3088
Web: www.WIRSBO.ca

2. Manufacturing Facilities

Uponor Canada Inc.
79 McIlveen Drive
St. John, New Brunswick
E2J 4Y6

3. Description

The AQUASAFE® Multipurpose Residential Sprinkler System (the "Aquasafe Network System") is a network sprinkler system designed in accordance with NFPA 13D " Installation of Sprinkler Systems in One and Two Family Dwelling Units and Manufactured Homes."

The AQUASAFE® Network System is a combination of a sprinkler system and a domestic potable water system.

The AQUASAFE® Network System utilizes "Aquapex", which is a crosslinked polyethylene plastic tubing, Reliable® residential sprinkler heads, a stainless steel multiport fitting, and a distribution manifold. All of the components are approved by CSA and/or ULC for use in a network system and a potable water system.

4. Authorization Requested

The Applicant sought authorization for the use the AQUASAFE® Network System to be installed in one and two family dwellings and manufactured homes within the scope of Part 9 of the Building Code, as a network system that combines a sprinkler system and a potable water system.

5. Assessment

Reports and assessments provided by the applicant show that if AQUASAFE® Network System is designed, performance tested, installed and maintained in accordance with the limitations in the manufacturer's instructions and the conditions stated in this authorization, the level of performance required by the Building Code will be provided.

Reports submitted and reviewed, but are not limited to the following:

1. Aquapex Installation Guide.
2. UL Listing EX6181, dated May 30, 2003.
3. CSA Certificate (10007033) of Compliance, issues November 21 2002.
4. AQUASAFE® Fire Safety Design Information Form.
5. Sample Engineering Calculations.
6. Sample Engineering Drawings, January 14, 2005 and April 11, 2005.
7. Reliable Sprinkler Manufacturer's Information.
8. AQUASAFE® Residential Fire Safety Installation Guide, Multipurpose System.
9. AQUASAFE®, Fire Safety, Hydraulic Sample Calculations.
10. AQUASAFE® Installation Acceptance Sample Form.
11. Partial Decision for Ruling 04-42-997 of the Building Code Commission (BCC A2004-47).
12. Proposed Changes to the National Plumbing Code.
13. Partial References from NFPA 13D "Installation of Sprinkler Systems in One and Two Family Dwelling Units and Manufactured Homes".
14. AQUASAFE® Manufacturer's Information.
15. Technical Background Information Memo, dated September 13, 2005, regarding BCC Application A2004-47.
16. Revised Manufacturer's Maintenance Instructions.
17. AQUASAFE® Flow Test Verification Sample Form.
18. AQUASAFE® Sample Installation Drawings.
19. AQUASAFE® Technical Submission.

6. Authorization

The AQUASAFE® Network System is authorized for use in one and two family dwellings and manufactured homes within the scope of Part 9 of the Building Code, as a network system that combines a sprinkler system and a potable water system, all other requirements pertaining to the construction and installation are subject to the requirements of the Building Code, and are subject to the following specific terms and conditions of this Authorization:

A. Specific Terms and Conditions

1. This Authorization is valid only for Uponor Canada Inc.

2. The AQUASAFE® Network System must be designed and installed in accordance with NFPA 13D “Installation of Sprinkler Systems in One and Two Family Dwelling Units and Manufactured Homes”.

3. All materials and components that form a part of the AQUASAFE® Network System shall be suitable for a potable water supply.

4. The AQUASAFE® Network System may be designed so that the number of sprinkler heads may exceed the number permitted in Sentence 3.2.5.13.(4) of the Building Code.

5. The AQUASAFE® Network System requires the installation of a backflow preventor, as required by Sentences 7.6.2.3.(4) of the Building Code, only at the point(s) of connection to a non potable system.

6. The Aquapex piping system must be designed to meet the flow requirements for the most demanding location in the system.

7. The AQUASAFE® Network System shall be designed using Reliable® residential sprinkler heads, models RFC43 CCP, FI RES 49 CCP, FI Recessed HSW and/or F1 Res 49 Recessed Pendent/F1.

8. The AQUASAFE® Network System shall be installed by installers who are trained and authorized by Uponor Canada Inc. personnel.

9. Uponor Canada Inc. shall provide the homeowner with a copy of the maintenance and inspection instructions.

10. Uponor Canada Inc. shall provide the authority having jurisdiction a copy of the “Flow Test Verification”.

11. Uponor Canada Inc. shall provide the homeowner with a copy of the “Flow Test Verification”.

12. Uponor Canada Inc. shall provide the homeowner with a notice advising that any alteration or addition to the AQUASAFE® Network System will require re-evaluation from Uponor Canada Inc. and re-approval from the authority having jurisdiction.

13. The AQUASAFE® Network System shall have a permanent sticker(s) or sign(s), posted in a conspicuous location at the building control valve–as defined by the Building Code– indicating at minimum, the following information:

    (a) do not remove this sign,

    (b) this is a network system, combining the fire protection and potable water system,

    (c) turning off the building control valve will render the sprinkler system inoperable, and

    (d) water softeners, tannin removers, iron filters or ancillary appliances shall not be added to this system without a review of the sprinkler system by a fire protection specialist.

B. General Conditions

1. The use of the AQUASAFE® Network System must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (the "BCA") and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

    (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

    (a) any change has been made to:

        (i) the material, system or building design that is the subject matter of this Authorization;

        (ii) the address of the applicant specified in Section 1 of this authorization; or,

        (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

    (b) the use of the material, system or building design authorized herein;

(i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 26 day of May 2005.

Authorization Report: Equipement Boni - Shelf and Rack Storage System

1. Applicant

Equipement Boni
1299 Marie-Victorin Blvd
St-Bruno, Quebec
J3V 6B7

Tel: (450) 653-1299
Fax: (450) 653-5391
Web: www.equipementboni.com

2. Manufacturing Facilities

Equipement Boni
1299 Marie-Victorin Blvd
St-Bruno, Quebec
J3V 6B7

Etalex
8501 Jarry Est
Anjou, Quebec
H1J 1H7

3. Description

The Equipement Boni shelf and rack storage system (the "shelf and rack storage system") is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment.

Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Building Code, as amended or remade from time to time and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Building Code.

Reports submitted and reviewed, but were not limited to:

1. Equipement Boni Sample Working Drawings.

2. Testing of Pallet Racks "Etalex Inc., G.N. Johnston Equipement Co Inc.", dated May 1999.

3. Final Report "Essais De Compression Sur Montants M Etalliques Boni Inc." University of Quebec, dated February 2002.

4. Equipement Boni Sample Calculations.

5. Equipement Boni Steel Storage Rack Safety Manual.

6. Equipement Boni Quality Control Drawings.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Equipement Boni.

Use and Occupancy

2.1 Except as where more restrictively provided for in 3.4. and 3.5. of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions; where the shelf and storage system incorporates the storage of rubber tires, such storage shall conform to the requirements of Subsection 3.3.1. "Indoor Tire Storage" of the Ontario Fire Code, Ontario Regulation 338/97, as amended or remade from time to time (the "OFC"),

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Building Code.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the OFC.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the Building Code.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization.
The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Class I, II, III and IV commodities as defined in NFPA 13 -1999 as amended.

3.5 Where Class I, II, I II and IV commodities and Group A, B, C, plastics and rubber tires as defined in NFPA 13-1999 are stored, the maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 7 m.

3.6 Lighting levels of walkways and platforms shall conform to the Building Code.

3.7 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the Building Code.

3.8 Guards and toe boards shall be installed in accordance with the Building Code.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 “Emergency Planning” of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Building Code except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m^2 in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Building Code using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2). of the Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the required Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each 'at-level' conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the 'at-level' cross-over and all inserts shall be sized to support loads required in Part 4 of the Building Code,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each 'at-level' cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the required Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 26 day of May 2005.

AUTHORIZATION REPORT- The Aquarobic Area Bed System

1. Applicant

Aquarobic Canada.
P.O. Box 149
Utterson, Ontario
P0B 1M0

Tel: (800) 452-0144
Fax: (705) 788-9204
Web: www.aquarobic-canada.com

2. Manufacturing Facilities

Aquarobic International Inc.
206 Wyck Street
Winchester, Virginia,
22601, USA

3. Description

The Aquarobic Area Bed System is primarily comprised of a tertiary treatment unit, an effluent filter, a dosing tank and an area bed.

The tertiary treatment units permitted for use with this system are referenced in the Supplementary Guidelines to the Building Code, as amended, as meeting tertiary quality effluent criteria and include models MicroMini-28, MicoMini-45, MiniPlant-70 and MiniPlant-85.

An effluent filter is required downstream of the treatment unit. The specification of the effluent filter may vary depending on the Area Bed System design, and the filter models specified for use with the Aquarobic Area Bed may be located in section 6.A.4. of this authorization.

The effluent is the pumped into a dosing tank and it is time dosed to the area bed.

An area bed is comprised of two parts; the stone layer and the sand layer. The sand layer of an area bed is sized in consideration of the soil it rests on, and under certain conditions, it may be required to be laterally extended. This lateral sand layer extension is known as the mantle.

The effluent is sent to the stone layer, by pressure from a pump, via a forcemain. Effluent is initially pumped from the treatment unit into the dosing tank. From the dosing tank, the forcemain terminates at a header or distribution box. From the header or distribution box, the effluent is sent to a series of perforated distribution pipes that run through the stone layer.

4. Authorization requested

The applicant sought an Authorization for an Area Bed System as an equivalent to a other Class 4 sewage systems as referenced in Section 8.7. “Leaching Beds” of the Building Code.

5. Assessment

Reports and assessments provided by the applicant show that if the Area Bed is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, the Building Code and the specific terms and conditions stated in this authorization, the level of performance required by the Building Code will be provided.

The following is a list of the documents submitted, and reviewed, but are not limited to:

1. NSF International Evaluation Report.
2. NSFI Testing Results.
3. Ruling of the Minister of Municipal Affairs and Housing: No 04SG-08, revised August 12, 2004.
4. Letter of Approval, Ministry of the Environment, September 15, 1980.
5. Manufacturer’s Information: API,50 Micron Spin Filter.
6. Operation and Maintenance Manual, Aquarobic
7. Service Contact, Aquarobic
8. Area Bed Component Drawings, dated December 2004, February 2003.
9. Area Bed System Description, Aquarobic.
10. Treatment Unit Approvals, Aquarobic.
11. Gunnell Engineering Report, May 17, 2005 AGAT Laboratories Certificate of Analysis.

6. Authorization

The Aquarobic Area Bed System is authorized as an equivalent to other Class 4 sewage systems as referenced to in Section 8.7. “Leaching Beds” of the Building Code; all other requirements pertaining to the design, installation and construction are subject to the regulations of the Building Code, and to the following terms and conditions:

A. Specific Terms & Conditions

1.0. Definitions

A word or phase used in this Authorization has the following meaning for the purposes of this Authorization:

Area Bed means the part of a leaching bed comprised of a stone layer and the underlying unsaturated sand layer intended to further treat and distribute the effluent, and does not include the area referred to as the mantle.

Contact Area means the area of infiltrative surface, directly below the area bed, required to absorb the treated effluent into the underlying native soil, but does not include the area where the mantle, if required, comes into contact with the native soil.

Extended Contact Area means the area of the sand bed, as extended, and mantle, where required, to meet the necessary lateral extension such that the effluent is absorbed into the underlying soil

Infiltrative Surface means the area of interface where effluent migrates downward from the sand layer of the area bed and, if necessary, the mantle and passes into the native soil or leaching bed fill.

Mantle means the lateral extension of the area bed using imported leaching bed fill having a T time of 15 min/cm or less, but does not include the area referred to as the area bed, necessary to provide an area of hydraulic catchment in any direction in which the effluent entering the leaching bed fill will move horizontally such that effluent is treated and absorbed.

Raised or Partially Raised Area Bed means a sewage system in which any part of the leaching bed is above the natural ground elevation.

Uniform Distribution means the even dispersal of effluent throughout all areas of an area bed and adjoining mantle, if required, as it migrates down from the stone layer to the underlying sand layer to either the native soil or mantle comprised of imported soil.

Vertical Separation means the depth of unsaturated soil below a leaching bed as measured from the bottom of the absorption trench or the bottom of the stone layer to a limiting surface such as high ground water table, rock or soil with a percolation time greater than 50 min/cm.

2.0 Installation Requirements

2.1. This Authorization is valid only for Aquarobic Canada.

2.2. Only Aquarobic Canada manufacturer trained and authorized agents or employees shall install, maintain and service the Area Bed System.

2.3. The Aquarobic Area Bed System shall be installed as per the manufacturer's installation instructions.

2.4. The Service and Maintenance Agreement prescribed by Sentence 8.9.2.3.(2) of the Building Code requires that the persons authorized by the manufacturer to service and maintain Area Bed System and who have entered into the agreement with the person operating the treatment unit, and shall:

2.4.1. conduct and record at least once during every six month period, an inspection and servicing as specified by the manufacturer of the Bio-Microbics treatment unit in the "Aquarobic Operation and Maintenance Manual"; and provide a copy to the person operating the Area Bed System;

2.4.2. provide a copy of the "Aquarobic Operation and Maintenance Manual" revised August 2003, to the person operating the Area Bed System and to the authority having jurisdiction at the time of the permit application;

2.4.3. conduct sampling and testing in accordance with the requirements of Clauses 8.9.2.4.(1)(a) and (b) of the Building Code;

2.4.3.1. once during the first 12 months after the Area Bed is put into use, and

2.4.3.2. thereafter, once during every 48 month period after the previous sampling has been completed,

2.4.4. promptly submit the sampling test results to the person operating the Aquarobic Area Bed System, and

2.5. Aquarobic Canada shall retain records of the sampling test results for each Area Bed System received pursuant to the terms and conditions set out in 2.4. above, for a period of 10 years and shall promptly forward copies of those records to a chief building official upon request.

3.0 System Requirements

3.1. All pipe connections in the system (i.e. pretreatment chamber, treatment units, accessory treatment units, tanks, pumps and filters) where incorporated, shall be flexible and watertight.

3.2. The Aquarobic treatment units used in the system shall use the daily design sewage flows as referenced in Table 3.2.1. “Daily Design Flow”:

Table 3.2.1.
Daily Design Flow

Treatment Unit Models	**Flow Range** **measured in Litres**
#54291-6: MicroMini-28	750 to 2800
#54291-6: MicroMini-45	2800 to 4500
#54291-15: MiniPlant-70	4500 to 7000
#54291-15: MiniPlant-85	7000 to 8500
Column 1	Column 2

3.3. A single chamber dosing tank;

3.3.1. shall be provided to receive the effluent from the treatment unit,

3.3.2. be sized at 1.5 times the daily design flow, and

3.3.3. in equal pumped volumes over a 24 hour period, time dose the effluent to the area bed.

4.0. Design

4.1. The Aquarobic Canada treatment units shall be fitted with an API 50 micron Spin Filter, model 4E40 on the discharge line of the treatment units.

4.2. An absorption system comprised of a stone layer overlying a sand layer and having a total minimum depth of 500 mm, and:

4.2.1. the stone layer shall be a minimum depth of 200 mm, and

4.2.2. the sand layer shall be a minimum depth of 250 mm and have a percolation time of 6 to 10 min/cm.

4.3. The stone layer required by 4.2. above, shall have a minimum area as specified by the manufacturer but not less than:

4.3.1. where the total daily design sanitary sewage flow does not exceed 3000 L, the area shall be such that the loading on the surface of the stone layer does not exceed 75 L/m² per day, or

4.3.2. where the total daily design sanitary sewage flow exceeds 3000 L, the area shall be such that the loading on the surface of the stone layer does not exceed 50 L/m² per day.

4.4. The stone layer required by the terms and conditions set out in 4.2. above, shall be protected with a permeable geo-textile fabric in such a manner so as to prevent soil or leaching bed fill from entering the stone.

4.5. The bottom of the stone layer shall be at all points vertically separated at least 600 mm from the high ground water table, rock or soil with a T time of 6 or less, or greater than 50 min/cm; except:

4.5.1. where the underlying soil has a T time of between 6 and 50 min/cm, the bottom of the stone layer at all points may be reduced to 450 mm to rock, high water table, and soil having a T time of 50 min/cm.

4.6. The effluent shall be evenly distributed over the stone layer to within 600 mm of the perimeter edge of the stone layer using distribution pipes in accordance with the Building Code Appendix A-8.7.5.3.(2); or other means that achieves even distribution to within 600 mm of the perimeter edge of the stone layer.

4.7. The sand layer shall have a minimum area that is the greater of;

4.7.1. the area of the stone layer required by the terms and conditions set out in 4.3. above,

4.7.2. where the sand layer is installed in soil having a T time of 15 min/cm or less, the loading rate at the base of the area bed, shall be calculated using the formula A = QT/850 (L/m^2/day), or

4.7.3. where the sand layer is installed in or on soil having a T time of greater than 15 min/cm, that the sand layer be extended using imported leaching bed fill having a T time of not more than 15 min/cm; the construction of the extended sand layer, including the area bed and mantle shall:

4.7.3.1. be to a depth of at least 250 mm,

4.7.3.2. extend at least 15 m beyond the perimeter of the treatment unit, or distribution pipes if utilized, in any direction that the effluent entering the soil will move horizontally, and

4.7.3.3. be calculated using the formula A = QT/400 or by using the example calculations as they are provided, in Table 4.7.3.3. “Combined Area Bed and Mantle Loading Rates”

Where:

A is the area of contact in m² between the base of the sand layer and the underlying native soil,

Q is the total daily design sanitary sewage flow in litres, and

T is the percolation time of the underlying native soil in min/cm to a maximum of 50.

Table 4.7.3.3.
Combined Area Bed and Mantle Loading Rates Example Calculations

Loading Rate A = QT/400	
T of the native soil.	Loading rate (L/m^2/day)
≤ 15	27
20	20
30	13
40	10
≥50	8
Column 1	Column 2

4.8. Any Area Bed System that must be raised to meet the vertical separation distances required by the terms and conditions set out in 4.5. of this Authorization, shall meet the mantle requirements of the terms and conditions set out in 4.7., regardless of the T time of the native soil.

B. General Conditions

1. The use of the Aquarobic Canada Area Bed System, and as described in the specific terms and conditions set out in 6.A. must comply with the *Building Code Act, 1992* (the "Act") as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6.A. above; or

   (b) the occurrence of any of the events described in conditions 6.B.4.(a) and (b)(ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the Act any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 26 day of May 2005.

AUTHORIZATION REPORT- PanelCraft™ Roof System

1. Applicant

Craft-Bilt Materials Ltd.
140 Steelcase Road West
Markham, Ontario
L3R 3J9

Tel: (905) 475-9492
(800) 668-6430
Fax: (905) 475-0685
www.cbm.on.ca

2. Manufacturing Facilities

Craft-Bilt Manufacturing Co.
53 Souderton-Hatfield Pike
Souderton, Pennsylvania
USA, 18964

3. Description

PanelCraft™'s structural insulated roof panel system may be used in the construction of heated and unheated sunroom additions to residential occupancy buildings.

The factory assembled structural insulated panel is comprised of a 76 mm (3") or 115 mm (4-1/2") or 152 mm (6") thick polystyrene core, two 0.6 mm (0.031") thick aluminium skins adhered to a Type II polystyrene core, having a nominal density of 24.028 kg/m^3.

The adhesive used in the panels is a moisture curing, one part, 100% solid, non-volatile, Type II urethane adhesive. The panels are 915 mm (3'-0") wide, and they are available in lengths varying from 2.4 m (7'-9") to 5.7 m (18'-0").

On site, a pre-decorated 11 mm (1/2") thick gypsum board is mechanically fastened, with a metal trim clip, to the interior side of the panel to form the PanelCraft™' Roof System.

4. Authorization requested

The Applicant sought a Building Materials Evaluation Commission (the "BMEC") Authorization for the use of the PanelCraft™ Roof System, in heated and unheated sunroom additions, which may be an addition to a residential occupancy buildings that are subject to the requirements of Part 9 of the Building Code.

5. Assessment

Reports and assessments provided by the Applicant show that if the PanelCraft™ Roof System is designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted, and reviewed, but were not limited to:

1. Craft-Bilt Materials Ltd. Roof Installation Guide, dated February 20, 2004.

2. Alan Zeegen Associates: documentation and drawings, dated May 2002, February 2004, May 2004.

3. Craft-Bilt Materials Ltd. Quality Control Manual.

4. National Evaluation Services, Inc., Report #NER-619, "PanelCraft™ Building Panels: Honeycomb and Polystyrene Sandwich Panels" issued October 1, 2001.

5. Buchan, Lawton, Parent Ltd Consulting Engineers, submissions dated: April 5, 2004, November 2003, and May 2004.

6. Craft-Bilt Materials Ltd. Manufacturer's Literature.

7. Canadian Building Digest CBD - 9 "Vapour Barrier in Home Construction"

8. Buchan, Lawton, Parent Ltd Consulting Engineers, Construction Drawings and Details "Polystyrene Core Panel with Pre-decorated Gypsum Covers Isometric" Drawing SA1.

6. Authorization

The PanelCraft™ Roof System is authorized for use as an innovative roof system designed for use in an acceptable heated or unheated sunroom addition, which may be in an addition to a building of residential occupancy; all other requirements pertaining to the installation of the PanelCraft™' Roof System shall be subject to the requirements of the Building Code, and are subject to the following terms and conditions.

A. Specific Terms & Conditions

1. This authorization is valid only for Craft-Bilt Materials Ltd.

2. The structural design and general review of the PanelCraft™ Roof System shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario); the Professional Engineer shall provide the chief building official with a document certifying that the installation conforms with this authorization.

3. The structural system supporting the authorized PanelCraft™ Roof System shall have sufficient structural capacity as required by the Building Code.

4. The maximum allowable deflection of the PanelCraft™ Roof System, as an expressed ratio of the clear span shall be L/240.

5. The 152 mm (6") PanelCraft™ Roof System is deemed to be in conformance with the thermal requirements of Subsection 9.25.2. of the Building Code.

6. Where the PanelCraft™ Roof System is used in unheated sunroom additions, the system need not meet the following Building Code requirements:

   (a) Subsection 9.25.2. “Thermal Insulation”, and Section 9.38. “Thermal Design”,

   (b) Subsection 9.25.3. “Air Barrier Systems”, and

   (c) Subsection 9.25.4. “Vapour Barriers”.

7. The use of the PanelCraft™ Roof System shall be limited to residential occupancy buildings that are subject to the requirements of Part 9 of the Building Code.

8. The PanelCraft™ Roof System shall not be used where the roof assembly is required to have a fire resistance rating.

9. The PanelCraft™ Roof System shall incorporate the use of a metal trim having a minimum thickness of 0.38 mm (0.015") when securing the pre-decorated gypsum board sheathing.

10. The PanelCraft™ Roof System shall be identified by a permanent stamp, sticker or mark indicating the manufacturer’s name or trademark.

11. If the PanelCraft™ Roof System incorporates an opening within the panel, or is modified to accommodate a penetration within the panel, then additional testing demonstrating that the modified roof panel conforms to the Building Code shall be submitted to the chief building official for review.

B. General Conditions

1. The use of the PanelCraft™ Roof System comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been mended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 28 day of April 2005.

Authorization Report - Shelf and Rack Storage Systems

1. Applicant

Metalsistem Canada Inc.
Storage and Display Solutions
55 West Beaver Creek Road, Unit 7
Richmond Hill, Ontario
L4B 1J5

Tel: (905) 886-9449
Fax: (905) 886-6890

2. Manufacturing Facilities

Metalsistem SPA.
Rovereto (TN)
Vial Dell'Industratria
Italy, 2

3. Description

The "Super 3" and the Unirack" shelf and rack storage systems are self contained structural systems within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Building Code, as amended or remade from time to time and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of "Super 3" and the Unirack" storage systems, as innovative shelf and rack storage systems designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack systems are used in accordance with the limitations and conditions stated in this authorization, they will provide the level of performance that would be achieved by conformance with the Building Code.

6. Authorization

The shelf and rack storage systems are authorized for use within a building as a self contained structural systems for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Metalsistem® Canada.

Use and Occupancy

2.1 Except as required by 3.4. of this authorization, the shelf and rack storage systems shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage systems are not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Building Code.

2.3 The shelf and rack storage systems shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time (OFC).

General

3.1 The structural components of the entire shelf and rack storage systems, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the Building Code.

3.2 The design and general review of the rack and storage systems shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage systems from the floor supporting the shelf and rack system to the topmost portion of the “Super 3" shelf and rack system shall not exceed 5 m, and 8 m when installing the “Unirack” shelf and rack system.

3.5 Lighting levels of walkways and platforms shall conform to the Building Code.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the Building Code.

3.7 Guards and toe boards shall be installed in accordance with the Building Code.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage systems are exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage systems are to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 “Emergency Planning” of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Building Code except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than two platform levels, the highest of which may not be more than 6 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Building Code using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

$$\textit{Total Egress Time} = (H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5 \text{ (in seconds)}$$

where: H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2). of the Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a "positive lock" when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the required Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the Building Code,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching ‘at-level’ conveyor cross-overs shall be marked in accordance with the required Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

(b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1 of this authorization; or,

(iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 28 day of April 2005.

USA, 47302

3. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Building Code, as amended or remade from time to time and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Building Code.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for HK Systems.

Use and Occupancy

2.1 Except as required by 3.4. of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Building Code.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time (OFC).

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the Building Code.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Class I, II, III and IV commodities as defined in NFPA 13 -1999 as amended.

3.5 Lighting levels of walkways and platforms shall conform to the Building Code.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the Building Code.

3.7 Guards and toe boards shall be installed in accordance with the Building Code.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 “Emergency Planning” of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Building Code except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m^2 in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Building Code using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:
- H_p = Horizontal travel distance on the shelf and rack storage (m)
- V_p = Vertical travel distance on the shelf and rack storage (m)
- H_m = Horizontal travel distance on the main floor (m)
- N_{lg} = Number of lift gates in the means of egress
- N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2). of the Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the required Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the Building Code,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching ‘at-level’ conveyor cross-overs shall be marked in accordance with the required Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

(b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1 of this authorization; or,

(iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 25 day of November 2004.

3. Description

The Pavilion Building System is a non pressurized building, wherein the structure is composed of a steel framework to support the Pavilion Membranes, which are tensioned to provide a weather barrier.

The steel frame structure of the Pavilion Building System shall be designed and constructed in accordance with the Building Code. The steel framework is a series of in-line clear span frames, with end walls. The frame pieces are modular and are used in different arrangements to make a variety of profiles, such as the Low Profile Texan, the Chalet and the Everest.

The Pavilion Membrane is on of two flame resistant woven polyolefin materials, Spiderweave FRU88X-6 (4 mil), or Spiderweave, P708. The Pavilion Membranes pieces are custom-sized and the edges reinforced for each building as per Pavilion specifications.

The Pavilion Membranes meet the requirements of a Class A material under ASTM E 84 Surface Burning Characteristics and satisfies the flammability requirements set out in CAN/ULC-S109 and NFPA 701-1996.

4. Authorization requested

The Applicant sought a Building Materials Evaluation Commission (BMEC) Authorization for the Pavilion Membranes for use as a roof covering, only when used in conjunction with a Pavilion Building System, as defined in this Authorization, in lieu of the requirements of Sentence 3.1.15.1.(1). “Roof Covering Classification” of the Building Code.

5. Assessment

Reports and assessments provided by the Applicant show that if the Pavilion Membranes are designed, performance tested and installed in accordance with the limitations in the manufacturer's instructions, and the specific terms and conditions stated in this Authorization, the level of performance required by the Building Code will be provided.

The reports submitted and reviewed, but were not limited to:

1. Office of State Fire Marshall, California Department of Forestry and Fire Protection Registration.

2. Bodycote Materials Testing Ortech Laboratory “NFPA 701-1989 Large Scale Flame Resistance of FRU88X-6 Fabric”, dated June 20, 2000.

3. Bodycote Materials Testing Ortech Laboratory “NFPA 701-1996 Test 1 and Test 2 Flame Resistance of FRU88X-6 Fabric”, dated September 6, 2001.

4. Bodycote Materials Testing Ortech Laboratory “CAN/ULC-S109 Flame Resistance of FRU88X-6 Fabric”, dated June 20, 2000.

5. Bodycote Materials Testing Ortech Laboratory “ASTM E 84 Surface Burning Characteristics of FRU88X-6 Fabric”, dated June 27, 2000.

6. Underwriters’ Laboratories of Canada “Report on Surface Burning Characteristics of Plastic Materials”, dated March 29, 1999.

7. “Draft Final Report Static Coefficient of Friction Tests, Nova Shield Fabrics”, project number 04-1284, dated March 22, 2004.

8. Atlas Material Testing Solutions “Hemispherical Spectral Reflection and near Normal/Hemispherical Spectral Transmittance Test Report”, Report No. 16909-0, dated April 11, 2003.

9. Bulletin, Building Approvals Department, Permits Section, City of Richmond, BC, “Temporary Tents” Permits-28, revised 2004-01-23.

10. Pavilion “Case Study” prepared for the Building Material Evaluation Commission, dated June 2004.

11. Nova-Shield™ Specification Sheet FRU88X-6 (4 mil).

12. Pavilion’s Installation Manuals, by Del-Scott-Co Inc.

13. Pavilion’s Warranty.

14. Quality Assurance Manual, Issue Number 3, dated October 20, 2003.

15. Pavilion’s Manufacturer’s Information.

16. Nova-Shield™ Manufacturer’s Information.

17. Excerpts from the Uniform Building Code 1985 ed.

18. Excerpts from the International Building Code 2003.

19. Pavilion Report “Supplementary Information” September 17, 2004.

20. Pavilion Report “Supplementary Information” June 30, 2004.

21. Pavilion Report “Supplementary Information” June 24, 2004.

22. Fabrene Industrial Fabric, type P708, dated September 14, 2004.

23. Bodycote Testing Materials Canada “ASTM E 84 Surface Burning Characteristics of FRU88X-6 Fabric”, dated August 24, 2004.

24. Fabrene Inc. Materials Testing Lab ASTM 1682, Tensile - Grab Test, dated November 11, 2004.

6. Authorization

The Pavilion Membranes are authorized for use as a roof covering, only when used in conjunction with a Pavilion Building System, in lieu of the requirements of Sentence 3.1.15.1.(1) “Roof Covering Classification” of the Building Code; all other requirements pertaining to the installation and construction are subject to the requirements of the Building Code and are subject to the following terms and conditions:

Note: this Authorization is not intended to be used as an equivalent to CAN/ULC-S107-M87 where roof coverings are permitted to be used in the construction of traditional roofing systems Class A, B, and C as determined by CAN/ULC-S107-M87.

A. Specific Terms & Conditions

1. This Authorization is valid only for the use of the Pavilion Membranes, Spiderweave FRU88X-6, or Spiderweave P708, when it is used in conjunction with a Pavilion Building System.

2. In addition to the requirements of Article 2.3.1.1. of the Building Code, the structural design shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario) and who is qualified in the specific method applied.

3. When the Pavilion Membranes are installed in conjunction with a Pavilion Building System, together they shall be constructed as per the requirements of Subsection 3.2.2. of the Building Code.

4. Except as permitted by Article 3.2.2.17. of the Building Code, the Pavilion Membranes shall not be used where the assembly is required to have a fire-resistance rating.

5. The Pavilion Membranes are authorized for use in combustible construction only.

6. The Pavilion Membranes shall not be used in a building more than 1 storey in building height.

7. The Pavilion Membranes shall not be used in the construction of Pavilion Building Systems where the major occupancy is Group B, C, or F Division 1, as defined by the Building Code.

8. The Pavilion Membranes shall meet the following standards:

   a. CAN/ULC-S109-M87 “Standard for Flame Test of Flame-Resistant Fabrics and Films”,

   b. NFPA 701-1999 “Methods of Fire Test for Flame Propagation of Textiles and Films” Test 2, and

   c. CAN/ULC-S102.2-M88 “Standard Test Method for Surface Burning Characteristics of Building Materials.”

9. The Pavilion Membranes shall be installed by Pavilion Building Systems’ approved installers.

10. The Pavilion Membranes shall be installed as per the Pavilion Building Systems Installation Manuals, and is subject to the products’ limitation as specified by the manufacturer.

11. The Pavilion Membranes shall be identified by a permanent mark that indicates the manufacturer's name and registered trademark.

12. The Pavilion Membranes shall not have a flame spread rating more than 25, as specified in CAN/ULC-S102.2-M88.

13. The Pavilion Membranes used in the construction of Pavilion Building Systems, shall have the spatial separation determined in accordance with Subsections 3.2.3. or 9.10.14. of the Building Code, where the roof membrane becomes a part of the exposing building face.

B. General Conditions

1. The use of the Pavilion Membranes must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 25 day of November 2004.

AUTHORIZATION REPORT- The Bio-Microbic Area Bed

1. Applicant

Bio-Microbics Inc.
8450 Cole Parkway
Shawnee, Kansas
USA 66227

Tel: (913) 422-0707
Fax: (913) 422-0808
Web: www.biomicrobics.com

2. Manufacturing Facilities

Bio-Microbics Inc.
8450 Cole Parkway
Shawnee, Kansas
USA 66227

3. Description

The Bio-Microbics Inc. Area Bed System is primarily comprised of a tertiary treatment unit, an effluent filter and an area bed.

The tertiary treatment units permitted for use with this system are referenced in the Supplementary Guidelines to the Building Code, as amended, as meeting tertiary quality effluent criteria and include models MicroFAST® 0.5., MicroFAST® 0.75, MicroFAST® 0.9, and MicroFAST® 1.5.

An effluent filter is required downstream of the treatment unit. The specification of the effluent filter may vary depending on the Area Bed System design, and the filter models specified for use with the Bio-Microbics Inc. Area Bed may be located in section 6.A.4. of this authorization.

An area bed is comprised of two parts; the stone layer and the sand layer. The sand layer of an area bed is sized in consideration of the soil it rests on, and under certain conditions, it may be required to be laterally extended. This lateral sand layer extension is known as the mantle. The effluent is sent to the stone layer, either by gravity or pressure from a pump, via a pipe. This pipe leads from the treatment unit and terminates at the distribution box or header. From the distribution box or header, the effluent is sent to a series of perforated distribution pipes that run through the stone layer.

4. Authorization requested

The applicant sought an Authorization for an Area Bed System as an equivalent to a other Class 4 sewage systems as referenced in Section 8.7. “Leaching Beds” of the Building Code.

5. Assessment

Reports and assessments provided by the applicant show that if the Area Bed is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, the Building Code and the specific terms and conditions stated in this authorization, the level of performance required by the Building Code will be provided.

The following is a list of the documents submitted, and reviewed, but are not limited to:

1. Ruling of the Minster of Municipal Affairs and Housing # 03-SG-05, dated July 16, 2003.

2. Supplementary Guidelines to the Ontario Building Code 1997, SG-5 Approved Sewage Treatment Units.

3. Technical Specifications - SIM/TEC Filter - STF-100/100A2 effluent filter assembly.

4. Engineering Analysis, re: GAG Sim /Tech Filter, dated 4/12/97.

5. Test Data re: GAG Sim /Tech Filter, dated April 10, 1997.

6. British Columbia Ministry of Health Services, re: Submerged Media Fixed Film Protocol, dated August 14, 2003.

7. Bio-Microbics “Quality Control Manual”

8. NSF Certification.

9. Massachusetts Alternative Septic System Test Center, Micro FAST, Model 0.5 “Technology Fact Sheet - Interim Finding”, 7/6/01.

10. Florida OWNERS Project Phase 1 - Test Data.

11. Florida OWNERS Project Phase 2 - Test Data.

12. Site Detail: Washington Stat “Effluent Discharged to Drip Irrigation Dispersal System”

13. Pinnacle Environmental Technologies Inc., Drawings dated October 2003, February 2003 and January 2004.

14. SIM/TECH manufacturer information, including sample STF-100 and STF-100A2.

15. "Bio-Microbics Service Manual" revised August 2003.

6. Authorization

The Bio-Microbics Inc. Area Bed System is authorized as an equivalent to other Class 4 sewage systems as referenced to in Section 8.7. "Leaching Beds" of the Building Code; all other requirements pertaining to the design, installation and construction are subject to the regulations of the Building Code, and to the following terms and conditions:

A. Specific Terms & Conditions

1.0. Definitions

A word or phase used in this Authorization has the following meaning for the purposes of this Authorization:

Area Bed means the part of a leaching bed comprised of a stone layer and the underlying unsaturated sand layer intended to further treat and distribute the effluent, and does not include the area referred to as the mantle.

Contact Area means the area of infiltrative surface, directly below the area bed, required to absorb the treated effluent into the underlying native soil, but does not include the area where the mantle, if required, comes into contact with the native soil.

Extended Contact Area means the area of the sand bed, as extended, and mantle, where required, to meet the necessary lateral extension such that the effluent is absorbed into the underlying soil

Infiltrative Surface means the area of interface where effluent migrates downward from the sand layer of the area bed and, if necessary, the mantle and passes into the native soil or leaching bed fill.

Mantle means the lateral extension of the area bed using imported leaching bed fill having a T time of 15 min/cm or less, but does not include the area referred to as the area bed, necessary to provide an area of hydraulic catchment in any direction in which the effluent entering the leaching bed fill will move horizontally such that effluent is treated and absorbed.

Raised or Partially Raised Area Bed means a sewage system in which any part of the leaching bed is above the natural ground elevation.

Uniform Distribution means the even dispersal of effluent throughout all areas of an area bed and adjoining mantle, if required, as it migrates down from the stone layer to the underlying sand layer to either the native soil or mantle comprised of imported soil.

Vertical Separation means the depth of unsaturated soil below a leaching bed as measured from the bottom of the absorption trench or the bottom of the stone layer to a limiting surface such as high ground water table, rock or soil with a percolation time greater than 50 min/cm.

2.0 Installation Requirements

2.1. This Authorization is valid only for Bio-Microbics Inc.

2.2. Only Bio-Microbics Inc. manufacturer trained and authorized agents or employees shall install, maintain and service the Area Bed System.

2.3. The Bio-Microbic Inc. Area Bed System shall be installed as per the manufacturer's installation instructions.

2.4. The Service and Maintenance Agreement prescribed by Sentence 8.9.2.3.(2) of the Building Code requires that the persons authorized by the manufacturer to service and maintain Area Bed System and who have entered into the agreement with the person operating the treatment unit, and shall:

2.4.1. conduct and record at least once during every six month period, an inspection and servicing as specified by the manufacturer of the Bio-Microbics treatment unit in the "Bio-Microbics Service Manual" revised August 2003; and provide a copy to the person operating the Area Bed System;

2.4.2. provide a copy of the "Bio-Microbics Service Manual" revised August 2003, to the person operating the Area Bed System and to the authority having jurisdiction at the time of the permit application;

2.4.3. conduct sampling and testing in accordance with the requirements of Clauses 8.9.2.4.(1)(a) and (b) of the Building Code;

2.4.3.1. once during the first 12 months after the Area Bed is put into use, and

2.4.3.2. thereafter, once during every 48 month period after the previous sampling has been completed,

2.4.4. promptly submit the sampling test results to the person operating the System and Bio-Microbics Inc. treatment unit, and

2.5. Bio-Microbics Inc. shall retain records of the sampling test results for each Area Bed System received pursuant to the terms and conditions set out in 2.4. above, for a period of 10 years and shall promptly forward copies of those records to a chief building official upon request.

3.0 System Requirements

3.1. All pipe connections in the system (i.e. pretreatment chamber, treatment units, accessory treatment units, tanks, pumps and filters) where incorporated, shall be flexible and watertight.

3.2. The Bio-Microbic treatment units used in the system shall use the daily design sewage flows as referenced in Table 3.2.1. “Daily Design Flow”:

Table 3.2.1.
Daily Design Flow

Treatment Unit Models	**Flow Range** **measured in Litres**
MicroFAST® 0.5	1300 to 1900
MicroFAST® 0.75	1900 to 2850
MicroFAST® 0.9	1900 to 3400
MicroFAST® 1.5	2850 to 5700
Column 1	Column 2

4.0. Design

4.1. The Bio-Microbic treatment unit shall be fitted with a bottomless sand filter or a BK-2000 filter, except

4.1.2. where the distribution of the effluent to the Area Bed is pressurized, a GAG Sim/Tech 100 micron, pressure filter model number STF-100 and STF-100AZ, or a 100 micron Vortex filter shall be used.

4.2. An absorption system comprised of a stone layer overlying a sand layer and having a total minimum depth of 500 mm, and:

4.2.1. the stone layer shall be a minimum depth of 200 mm, and

4.2.2. the sand layer shall be a minimum depth of 250 mm.

4.3. The stone layer required by 4.2. above, shall have a minimum area as specified by the manufacturer but not less than:

4.3.1. where the total daily design sanitary sewage flow does not exceed 3000 L, the area shall be such that the loading on the surface of the stone layer does not exceed 75 L/m² per day, or

4.3.2. where the total daily design sanitary sewage flow exceeds 3 000 L, the area shall be such that the loading on the surface of the stone layer does not exceed 50 L/m² per day.

4.4. The stone layer required by the terms and conditions set out in 4.2. above, shall be protected with a permeable geo-textile fabric in such a manner so as to prevent soil or leaching bed fill from entering the stone.

4.5. The bottom of the stone layer shall be at all points vertically separated at least 600 mm from the high ground water table, rock or soil with a T time of 6 or less, or greater than 50 min/cm; except:

4.5.1. where the underlying soil has a T time of between 6 and 50 min/cm, the bottom of the stone layer at all points may be reduced to 450 mm to rock, high water table, and soil having a T time of 50 min/cm.

4.6. The effluent shall be evenly distributed over the stone layer to within 600 mm of the perimeter edge of the stone layer using distribution pipes in accordance with the Building Code Appendix A-8.7.5.3.(2); or other means that achieves even distribution to within 600 mm of the perimeter edge of the stone layer.

4.7. The sand layer shall have a minimum area that is the greater of;

4.7.1. the area of the stone layer required by the terms and conditions set out in 4.3. above,

4.7.2. where the sand layer is installed in soil having a T time of 15 min/cm or less, the loading rate at the base of the area bed, shall be calculated using the formula A = QT/850 (L/m^2/day), or

4.7.3. where the sand layer is installed in or on soil having a T time of greater than 15 min/cm, that the sand layer be extended using imported leaching bed fill having a T time of not more than 15 min/cm; the construction of the extended sand layer, including the area bed and mantel shall:

4.7.3.1. be to a depth of at least 250 mm,

4.7.3.2. extend at least 15 m beyond the perimeter of the treatment unit, or distribution pipes if utilized, in any direction that the effluent entering the soil will move horizontally, and

4.7.3.3. be calculated using the formula A = QT/400 or by using the example calculations as they are provided, in Table 4.7.3.3. “Combined Area Bed and Mantle Loading Rates”

Where:

A is the area of contact in m² between the base of the sand layer and the underlying native soil,

Q is the total daily design sanitary sewage flow in litres, and

T is the percolation time of the underlying native soil in min/cm to a maximum of 50.

Table 4.7.3.3.
Combined Area Bed and Mantle Loading Rates Example Calculations

Loading Rate A = QT/400	
T of the native soil.	Loading rate (L/m^2/day)
≤ 15	27
20	20
30	13
40	10
≥50	8
Column 1	Column 2

4.8. Any Area Bed System that must be raised to meet the vertical separation distances required by the terms and conditions set out in 4.5. of this Authorization, shall meet the mantle requirements of the terms and conditions set out in 4.7., regardless of the T time of the native soil.

B. General Conditions

1. The use of the Bio Microbics' Inc. Area Bed System, and as described in the specific terms and conditions set out in 6.A. must comply with the *Building Code Act, 1992* (the "Act") as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6.A. above; or

(b) the occurrence of any of the events described in conditions 6.B.4.(a) and (b)(ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Act any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 25 day of November 2004.

AUTHORIZATION REPORT - LUNAplast™ Photoluminescent Exit Signs

1. Applicant

Luna Technologies International Inc.
61A Fawcett Road
Coquitlam, British Columbia
V3K 6V2

Tel: (604) 526-5890
Fax: (604) 526-8995
Web: www.lunaplast.com

2. Manufacturing Facilities

Luna Technologies International Inc.
61A Fawcett Road
Coquitlam, British Columbia
V3K 6V2

3. Description

The LUNAplast™ Photoluminescent Exit Sign ("Luna Sign") is a directional exit sign.

The Luna Sign consists of a photoluminesecnt background and opaque letters spelling the word "EXIT" or "SORTIE". Opaque directional indicators are optional and are included at one or both sides of the "EXIT" and "SORTIE" legend.

The LUNA 5000 Series consists of a single photoluminescent panel consisting of a rigid poly vinyl chloride (PVC) sheet, blended with strontium oxide photoluminescent pigment that emits light continuously through the absorption of at least 54 lux (5 foot-candles) of ambient illumination.

The Luna 5000 series denotes mounting options. The wall mounted bracket, 5000W Luna Sign consists of a photoluminescent placard, silk screened with the word "EXIT" or "SORTIE"; the flag mounted bracket, 5000F1 and 5000F2 Luna Sign consists of one or two photoluminescent placards, silk screened with the word "EXIT" or "SORTIE, for a single sided or double side application; the ceiling mounted bracket, 5000C1 and 5000C2 Luna Sign consists of photoluminescent placards silk screened with the word "EXIT" or "SORTIE" for a single sided or double side applications.

All authorized Luna Signs have red letters and a photoluminescent background.

4. Authorization Requested

The Applicant sought a Building Materials Evaluation Commission ("BMEC") authorization for the Luna Signs as a means of egress identification under Subsections 3.4.5. "Exit Signs" or 9.9.10. "Signage" with conditions and limitations, equivalent to the requirements of Building Code, as amended.

5. Assessment

Reports and assessments provided by the applicant show that if the Luna Signs are designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, all other requirements of the Building Code, and the specific terms and conditions stated in this authorization, that the level of performance required by the Building Code will be provided.

The following is a list of the documents submitted, and reviewed, but is not limited to:

1. Manufacturer's Information "Introducing the LUNAplast™ UL-924 Sign".

2. LUNAplast™ Exit Sign Label.

3. LUNAplast™ Installation Instructions, revised September 10, 2004.

4. Underwriter Laboratories Inc. "Procedures and Report Materials", dated 2004/04/05.

5. Underwriter Laboratories Inc. "Online Certification Directory" FWBX.E226940, dated 7/20/2004.

6. Material Safety Data Sheet "PVC Based Photoluminescent Vinyl Foam", Dated August 2001.

7. Underwriter Laboratories Inc. "Follow up Services Test Results for Exit Signs" March 11, 2004.

8. Underwriter Laboratories Inc. "Follow Up Procedure" revised 2003/01/30.

9. Excerpts from NFPA 101 "Life Safety Code" , 2000 Edition.

10. Energy Star Approval, April 20, 2004.

11. City of Vancouver Approval, May 21, 2004.

12. Transport Canada Approval "Safety and Security", June 29, 1998.

13. State of Indiana Approval, September 12, 2002.

14. National Research Council Summary of Report No. PO-1796, June 24, 1998

15. Report "A Field Study on Photoluminescent Signage Used to Guide Building Occupants to Exit in Complete Darkness", Proulx, Creak and Kyle.

16. SAE Paper "ISS Emergency Egress "A System for Crewmember Pathway Indication", 2001-01-2184.

6. Authorization

The Luna Signs are authorized for use as a means of egress identification under Subsections 3.4.5. "Exit Signs" or 9.9.10. "Signage", all other requirements pertaining to the installation are subject to the requirements of the Building Code, and subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This Authorization is valid only for the Luna Signs model numbers described in Table 6.A.1. "Exit Signs",

Table 6.A.1.
Exit Signs

Model Number	Description	Single / Double Sided
5000W	wall mounted with red letters and a photoluminescent background	single sided
5000F1	flag mounted with red letters and a photoluminescent background	single sided
5000F2	flag mounted with red letters and a photoluminescent background	double sided (2 placards)
5000C1	ceiling mounted with red letters and a photoluminescent background	single sided
5000C2	ceiling mounted with red letters and a photoluminescent background	double sided (2 placards)
Column 1	Column 2	Column 3

2. The Luna SORTIE Sign, shall only be installed adjacent to an approved Luna Sign, as it is described in Table 6.A.1. “Exit Signs” of this Authorization.

3. Except as permitted by Specific Term and Condition 6.A.4., the Luna Signs are not required to be provided with an emergency power supply as described in Sentence 3.2.7.4.(1) of the Building Code.

4. Approved models of the Luna Signs may be installed in a building under the scope of Subsection 3.2.6. “Additional Requirements for High Buildings” of the Building Code if they are illuminated directly by a lighting fixture providing 54 lux (5 ft candles) of unfiltered fluorescent illumination and having a power source conforming to Subclause 3.2.7.4.(1)(b)(i) of the Building Code.

5. Except as provided by Specific Term and Condition 6.A.4., approved models of the Luna Signs may be substituted for exits signs as described in Subsections 3.4.5. “Exit Signs” or 9.9.10. “Signage” of the Building Code.

6. The Luna Signs require a minimum of 54 lux (5 ft candles) of constant and continuous external unfiltered fluorescent, lighting to illuminate the face(s) of the signs at all times.

7. The Luna Signs shall be located so that the listed legible viewing distance of the sign is not greater than 22.3 m (75 ft).

8. The Luna Signs shall have the following markings:

   a. Luna,

   b. a UL/ULC listing label,

   c. Model number,

   d. Legible viewing distance, and

   e. “CAUTION: a minimum 5 foot-candle of external un-filtered fluorescent illumination must be present on the sign face at all times of building occupancy.”

9. The Luna Signs shall be installed as per the manufacturer’s instructions.

10. The Luna Signs are authorized for indoor applications only.

11. The Luna Signs shall not be exposed to direct sunlight.

12. The Luna Signs shall not be exposed to temperatures outside the range of 10^0 to 40^0 C (50^0 to 104^0 F).

13. The Luna Signs shall be cleaned with a damp cloth or as otherwise recommended by the manufacturer.

B. General Conditions

1. The use of the Luna Signs as described in Specific Terms and Conditions 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in A. above; or

   (b) the occurrence of any of the events described in Conditions 6.B.4.(a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      I. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      i. does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

      ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 30th day of September 2004.

AUTHORIZATION REPORT - Bradyglo™ High Performance Photoluminescent Exit Signs

1. Applicant

Brady Canada Inc.
56 Leek Crescent
Richmond Hill, Ontario
L4B 1H1

Tel: (800) 263-6179
Fax: (800) 387-4935
Web: www.bradyid.com

2. Manufacturing Facilities

Jessup Manufacturing Company
2815 West Route 120
McHenry, Illinos 60050
United States

3. Description

Brady B-355 BRADYGLO™ High Performance Photoluminescent Exit Signs ("Brady Signs") are directional exit signs, and they are available framed or frameless. The Brady Signs have a photoluminescent panel consisting of a rigid PVC sheet blended with strontium oxide photoluminescent pigment that emits light continuous through the absorption of at least 54 lux (5 foot-candles) of ambient illumination.

The framed Brady Sign consist of a photoluminescent placard inside a frame, which is provided with knockouts spelling the words "EXIT" or "SORTIE and optional directional indicator knockouts. The framed Brady Sign is available in single and double sided, with a mounting bracket or wall mounted. The frame for the Brady Sign is powder coated steel.

The frameless placard consists of a photoluminesecnt background and opaque letters spelling the word "EXIT" or "SORTIE". Opaque directional indicators are optional and are included at one or both sides of the "EXIT" and "SORTIE" legend. The substrate material is semi-rigid PVC, it is provided with holes for mechanical mounting to the surface.

4. Authorization Requested

The Applicant sought a Building Materials Evaluation Commission ("BMEC") authorization for the Brady Signs as a means of egress identification under Subsections 3.4.5. "Exit Signs" or 9.9.10. "Signage" with conditions and limitations, equivalent to the requirements of Building Code, as amended and remade from time to time.

5. Assessment

Reports and assessments provided by the applicant show that if the Brady Signs are designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, all other requirements of the Building Code, and the specific terms and conditions stated in this authorization, that the level of performance required by the Building Code will be provided.

The following is a list of the documents submitted, and reviewed, but is not limited to:

1. Report from Sarah Maman P. Eng “Fire, Life Safety and Security Institute”, dated June 24, 2004.

2. Brady B-355 BRADYGLO™ High Performance Photoluminescent Exit Sign Installation Instructions.

3. Brady B-355 BRADYGLO™ High Performance Photoluminescent , Technical Data Sheets TDS No. B-355.

4. ICC ES Legacy Report (ER-6153) Brady B-355 BRADYGLO™ High Performance Photoluminescent

5. Brady B-355 BRADYGLO™ High Performance Photoluminescent, UL and ULC certificates.

6. Jessup Manufacturing Company ISO 9002 Certificate.

7. Brady B-355 BRADYGLO™ High Performance Photoluminescent, Manufacture Information.

8. Brady B-355 BRADYGLO™ High Performance Photoluminescent, Product Information.

9. CAN/CSA-C860-96 “Performance of Internally Lighted Exit Signs” Performance of Electrical Products.

10. ULC/ORD-C924-02 “Photoluminescent And Self-Luminous Exit Signs”.

11. UL 924 “Emergency Lighting and Power Equipment”.

12. ULC letter September 7, 2004, re: Brady Photoluminescent Exit Sign.

6. Authorization

The Brady Signs are authorized for use as a means of egress identification under Subsections 3.4.5. “Exit Signs” or 9.9.10. “Signage”, all other requirements pertaining to the installation are subject to the requirements of the Building Code, and subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This Authorization is valid only for the Brady Signs model numbers described in Table 6.A.1. “Exit Signs”,

   Table 6.A.1.
   Exit Signs

Model Number	Frame Colour	Single / Double Sided
90885	Red	Single Sided Wallmount
90839	Red	Single Sided with Bracket
90840	Red	Double Sided with Bracket
87807	Frameless Red Letters	Single Sided Wallmount
98452	Framelss Red Reflective Letter	Single Sided Wallmount
Column 1	Column 2	Column 3

2. The SORTIE Sign, model number 98451, shall only be installed adjacent to an approved Brady Sign, as it is described in Table 6.A.1. “Exit Signs” of this Authorization.

3. Except as permitted by Specific Term and Condition 6.A.4., the Brady Signs are not required to be provided with an emergency power supply as described in Sentence 3.2.7.4.(1) of the Building Code.

4. Approved models of the Brady Signs may be installed in a building under the scope of Subsection 3.2.6. “Additional Requirements for High Buildings” of the Building Code if they are illuminated directly by a lighting fixture providing 54 lux (5 ft candles) of unfiltered fluorescent illumination and having a power source conforming to Subclause 3.2.7.4.(1)(b)(i) of the Building Code.

5. Except as provided by Specific Term and Condition 6.A.4., approved models of the Brady Signs may be substituted for exits signs as described in Subsections 3.4.5. “Exit Signs” or 9.9.10. “Signage” of the Building Code.

6. The Brady Signs require a minimum of 54 lux (5 ft candles) of constant and continuous external unfiltered fluorescent, lighting to illuminate the face(s) of the signs at all times.

7. The Brady Signs shall be located so that the listed legible viewing distance of model numbers 90885, 90839, 90840, 87807, 98452, and 98451 is not greater than 15.2 m (50 ft).

8. The Brady Signs shall have the following markings:

   a. Brady Canada Inc.

   b. a UL/ULC listing label,

   c. Model number,

   d. Legible viewing distance, and

   e. "CAUTION: a minimum 5 foot-candle external un-filtered fluorescent illumination must be present on the sign face at all times of building's occupancy."

9. The Brady Signs shall be installed as per the manufacturer's instructions.

10. The Brady Signs are authorized for indoor applications only.

11. The Brady Signs shall not be exposed to direct sunlight.

12. The Brady Signs shall not be exposed to temperatures outside the range of 10^0 to 40^0 C (50^0 to 104^0 F).

13. The Brady Signs shall be cleaned with a damp cloth or as otherwise recommended by the manufacturer.

B. General Conditions

1. The use of the Brady Signs as described in Specific Terms and Conditions 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in A. above; or

(b) the occurrence of any of the events described in Conditions B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

I. the material, system or building design that is the subject matter of this Authorization;

ii. the address of the applicant specified in Part 1 of this Authorization; or,

iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

I. does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 30th day of September 2004.

AUTHORIZATION REPORT: Hancor Envirochambers™

1. Applicant

Hancor Inc.
2490 Route 139
St. Nicephone, Quebec
J2A 4H7

Tel: (819) 472-8228
Fax: (819) 472-4343

2. Manufacturing Facilities

Vantage Product
960 Almon Road
Conington, GA, 30014

Carson Industries
1675 Industrial Drive
Napoleon Drive, OH, 43545

Ft. Wayne Plastics
510 Sumpter Drive
Ft. Wayne, IN, 46804

3. Description

Hancor Envirochambers™: Narrow, Standard, Hi-capacity (the "Hancor Chambers") are intended for use in a sewage system in lieu of absorption trenches constructed of stone and distribution pipe.

The Narrow chamber has a bottom width of 380 mm and a height of 292 mm, the Standard chamber has a bottom width of 850 mm and a height of 300 mm and the Hi-capacity chamber has a bottom width of 850 mm and a height of 450 mm.

The Hancor Chambers are formed from injection moulded high density polyolefin and are connected end-to-end using overlapping dowels with pilot hole connections.

The sidewall louvers are set at a 30 degree angle to help prevent soil intrusion and the Hancor Chambers are closed at the ends of the trenches with snap-on end plates.

4. Authorization requested

The applicant sought authorization for use of the Hancor Chambers as an alternative to the construction of absorption trenches as required by Section 8.7 of the 1997 Ontario Building Code, as amended (the "Building Code"). The applicant requested that the Hancor Chambers be used to replace stone and distribution pipe in absorption trenches and filter beds that are:

(a) gravity fed,
(b) "dosed" (non-pressurized distribution system), and
(c) pressurized.

Note: For the purposes of this authorization, "dosed" means a system in which effluent is pumped to the leaching bed, either through the use of a pump or siphon, but the effluent is not pressurized within the leaching bed.

5. Assessment

Reports and assessments provided by the applicant show that if the Hancor Chambers are designed, performance tested, installed and maintained in accordance with the limitations in the manufacturer's instructions, and the conditions stated in this authorization, a level of performance will be provided as required by the Building Code for absorption trenches in soil, in leaching bed fill or in a filter bed, whether gravity fed, pressurized or "dosed".

Listed below are the reports that were submitted and reviewed, but are not limited to:

1. Hancor Envirochamber™ "Trench Length Reductions and Warranty Periods" by State.

2. Manufacturer Information " EnviroChamber™, On -Site Wastewater Management Systems."

3. Envirochamber™ Units Septic Leach Field System, Trench Design Installation Instruction.

4. Hancor Envirochamber™ Unit Specifications Data Sheet.

5. Envirochamber™ units and Accessories Sheet.

    h. Department of Environmental Protection, Massachusetts, US, April 24, 2002.

6. Authorization

The Hancor Chambers are authorized for use in sewage systems within the scope of Part 8 of the Building Code, as an alternative to stone and distribution pipes in absorption trenches and in filter beds, when installed in accordance with the manufacturer's recommendations, all other requirements pertaining to the installation and construction are subject to the requirements of the Building Code, and to the Specific Terms and Conditions of this Authorization:

A. Specific Terms & Conditions

1. This authorization is valid only for Hancor Chambers: Narrow, Standard, Hi-capacity.

2. The Hancor Chambers shall be manufactured to AASHTO Standard H-10 loading.

3. When the Hancor Chambers are installed in lieu of distribution piping and stone, the length of the chamber system must equal the required lengths of distribution pipe specified in Articles 8.7.3.1. and 8.7.5.3 of the Building Code.

4. When the Hancor Chambers are installed in lieu of distribution piping and stone, the leaching beds must satisfy the general construction requirements specified in Articles 8.7.2.1., 8.7.4.2. and 8.7.5.3 of the Building Code.

5. The minimum clearance distances required by Article 8.2.1.6. of the Building Code for distribution piping shall be met by the Hancor Chambers.

6. When installed in lieu of distribution piping and stone in absorption trenches, the trenches for the Hancor Chambers shall be:

   (a) approximately the same length and not more than 30 m in length,

   (b) a minimum width of 500 mm,

   (c) at least 600 mm and not more than 900 mm in depth,

   (d) centred at least 1600 mm,

   (e) at least 900 mm at all points on the bottom of the trench, above the high ground water table, rock or soil with a percolation time greater than 50 minutes,

   (f) backfilled, after installation of the Hancor Chambers, with leaching bed fill, so as to ensure that after the leaching bed fill settles, the surface of the leaching bed will not form any depressions, and

   (g) backfilled with a soil that does not contain heavy clay, silt or debris, and is manually compacted along the sides of the chamber to provide lateral support.

7. When installed in lieu of distribution piping and stone in filter beds, the lines of the Hancor Chambers shall be evenly spaced over the surface of the filter medium to which the sewage effluent is applied, and the filter bed shall meet the following requirements:

   (a) the filter medium shall meet the requirements of Subsection 8.7.5. of the Building Code,

   (b) the surface of the filter bed shall be at least 900 mm above the high ground water table, rock or soil with a percolation time greater than 50 minutes per centimetre as per Clause 8.7.3.2.(1)(e) of the Building Code.

8. When used in gravity fed conditions, the Hancor Chambers shall be installed in compliance with all the above-stated Specific Terms and Conditions and be:

   (a) installed level over the length of the trench,

   (b) securely connected, chamber to chamber, using the built-in latch,

   (c) free of structural damage and used full length (not cut),

   (d) equipped with end caps installed on both ends, and

   (e) equipped with a built-in splash plate at the inlet end of each chamber line, to prevent soil scouring.

9. Where the sewage effluent is "dosed" to the leaching bed by pumps or a siphon, the Hancor Chambers shall be installed to comply with all the above-stated Specific Terms and Conditions and:

   (a) the effluent is pumped to a header line or distribution box prior to entering the chambers, and

   (b) a volume of effluent within the range of 3.5 - 8.0 litres per metre of Hancor Chambers, must be pumped within a time period not exceeding 15 minutes, to meet the requirements of Sentence 8.6.1.3.(4) of the Building Code.

10. Where the sewage effluent is distributed through a pressurized system, the Hancor Chambers shall be installed:

   (a) to comply with Specific Terms and Conditions numbers 1. through 9. above, and

   (b) with a minimum 1½ (38 mm) diameter pipe extending over the entire length of each trench, and such pipe:

      I. being specified by the manufacturer as acceptable for pressurized installations,

      ii. having minimum 6 mm diameter orifices, spaced over its length to ensure even distribution of effluent,

      iii. being supported in a manner as to ensure self-draining and prevent freezing of its contents,

iv. having clean-outs installed at the downstream end of each chamber line, to allow the system to be serviced, and

v. receiving effluent from a treatment unit equipped with an effluent filter on the outlet, such effluent filter to be installed and sized in accordance with the manufacturer's recommendations.

B. General Conditions

1. The use of the Hancor Chambers System must comply with the *Building Code Act, 1992* (the Act") as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      I. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      I. does not comply with the Act or any relevant legislation as they may be amended or re-enacted from time to time; or

      ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29th day of July 2004.

AUTHORIZATION REPORT - SafeSIGN Photoluminescent EXIT Signs

1. Applicant

Enviromate Products Corporation
P.O Box 1025
135 West Beaver Creek Road.
Richmond Hill, Ontario
L4B 4R9

Tel: (905) 709-5772
Fax: (905) 709 5702

2. Manufacturing Facilities

Irotex Co.
F.L. Crystal Blvd.
1-44 No. 1 Hsin Y.
Road Sec. 4 P.O. Box 26-460
Taipei, Taiwan

3. Description

The Photoluminescent EXIT Signs (the “Exit Signs”) are provided with pre-drilled holes for a mechanical surface mount, or the Exit Signs may also be mounted onto a wall or ceiling using the manufactured recommended aluminium mounting bracket.

Each letter that spells the word EXIT on the approved sign shall be 15.2 cm (6") high, with a stroke width of 2.3 cm (0.9") wide.

The Flush Mount (FL) series Exit Signs consist of sign placards with a photoluminescent background with red letters or photoluminescent letters with red background spelling the word “EXIT”. Red or photoluminescent directional indicators matching the colour scheme are available to be placed at each side of the Exit Sign. The substrate material is sheet aluminum, and the photoluminescent pigment is applied to the substrate using a heat fusion process to ensure the permanent bonding of the two materials.

The Box Frame (BX) series Exit Signs are similar to the FL series, the BX series consists of a sign placard with photoluminescent background with red letters or photoluminescent letters with red background spelling the word “EXIT”.

The BX2 series Exit Signs are similar to the BX Series Exit Signs except they incorporate field-securable aluminum directional indicators on the face of the Exit Sign. The directional arrows are secured to the sign face by bending the manufacturer supplied aluminium tabs, as recommenced by the manufacturer.

4. Authorization Requested

The Applicant sought a Building Materials Evaluation Commission (a "BMEC") authorization for the Exit Signs as a means of egress identification under Subsections 3.4.5. "Exit Signs" or 9.9.10. "Signage" with conditions and limitations, equivalent to the requirements of 1997 Ontario Building Code, as amended and remade from time to time (the "OBC").

5. Assessment

Reports and assessments provided by the applicant show that if the Exit Signs are designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, all other requirements of the OBC, and the specific terms and conditions stated in this authorization, that the level of performance required by the OBC will be provided.

The following is a list of the documents submitted, and reviewed, but is not limited to:

1. Underwriter Laboratories of Canada Listing, reference SA12703/02NK21104, Dated October 25, 2002.

2. Underwriter Laboratories of Canada "Notice of Project Completion", reference SA12703/02NK21104, Dated July 19, 2002.

3. Underwriter Laboratories of Canada "Report on Exit Sign, Self Luminous and Photo luminescent certificated for Canada", reference SA12703/02NK21104, dated October 25, 2002.

4. MB Research Laboratories, "Dermal Toxicity Testing", reference 00-8327.02, dated May 3, 2000.

5. SGS U.S. Testing Company, "Certifying Duration of the Photoluminescent", reference 140074, dated April 27, 2000.

6. DL Laboratories, Torontex Corporation, "Certifying the Washability and Self-extinguishing Properties", reference DL-12669A, dated April 07, 2000.

7. SafeSIGN Photoluminescent specification Data:

    (a) 75' Flush Mount Exit Sign
    (b) 75' Box Frame Exit Sign
    (c) 75' Flush Mount SORTIE Sign
    (d) 50' Box Frame Exit Sign
    (e) 50' Box Frame Exit Sign

8. SafeSIGN Warranty, "SafeSIGN ULC-924 Approved Photoluminescent EXIT Signs."

9. CIEMS “Certifying the Absence of Radioactivity”, reference 5000530642, dated March 24, 2000.

10. Approvals by other jurisdictions:

    (a) New York City MEA Acceptance
    (b) New York City Proposed Changes to the Building Code
    (c) Life Safety Code - NFPA 101
    (d) Nova Scotia Environment & Labour
    (e) Saskatchewan Corrections & Public Safety
    (f) Government of the Northwest Territories

11. Construction Innovation, Volume 4, Number 4, Fall 1999, National Research Council, “Photoluminescent material holds potential as an alternative to emergency lighting research finds.”

12. UL Laboratories, Testing Laboratories - UL Question Corner “Are Photoluminescent exit signs Listed or Classified?”

13. Installation Manuals, “Installation Instruction for SafeSIGN ULC-ORD-924-02-compliant photoluminescent EXIT Signs (FL and BX)”, dated 2004.

14. Quality Control Manuals: Irotex Corporations Quality Control policies.

15. Underwriter’s Laboratories of Canada Factory Inspection Invoices, September 13, 2003.

16. Underwriter’s Laboratories of Canada letter, reference file SA12703, dated May 10, 2004.

6. Authorization

The Exit Signs are authorized for use as a means of egress identification under Subsections 3.4.5. “Exit Signs” or 9.9.10. “Signage”, all other requirements are subject to the regulations of the OBC, and subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This Authorization is valid only for the Exit Sign model numbers described in Table 6.A.1.1. “Exit Signs” below.

Table 6.A.1.1.
Exit Signs

ULC Model Numbers	UL Model Numbers	Model Series	Background Colour (1)	Letter Colour (1)
UC01A3120	U01A3120	FL	RED	LUMINOUS
UC02A3120	U02A3120	FL	LUMINOUS	RED
UC01A3720	U01A3720	BX	RED	LUMINOUS
UC02A3720	U02A3720	BX	LUMINOUS	RED
UC04A3720	U04A3720	BX2	RED	LUMINOUS
C01AR	C01AR	FL	RED	LUMINOUS
C02AR	C02AR	FL	LUMINOUS	RED
Column 1	Column 2	Column 3	Column 4	Column 5

(1) using Columns 4 and 5 will distinguish the colour convention of any one sign.

2. The SORTIE Signs model numbers UF01A4620 and UF02A4620 shall only be installed adjacent to approved Exit Signs, as they are described in Table 6.A.1.1. ”Exit Signs” of this authorization.

3. The Exit Signs are not required to be provided with an emergency power supplied as described in Sentence 3.2.7.4.(1) of the OBC.

4. Except as provided by Specific Term and Condition 6.A.5., approved models of the Exit Signs may be substituted for exits signs as described in Subsections 3.4.5. “Exit Signs” or 9.9.10. “Signage” of the OBC.

5. Approved models of the Exit Signs may be installed in a building under the scope of Subsection 3.2.6. “Additional Requirements for High Buildings” of the OBC only if they are illuminated directly by a lighting fixture providing 54 lux (5 ft candles), which is measured on the sign face, of unfiltered fluorescent illumination and having a power source conforming to Subclause 3.2.7.4.(1)(b)(i) of the OBC.

6. The Exit Signs require a minimum of 54 lux (5 ft candles) of constant and continuous external unfiltered fluorescent, lighting to illuminate the face(s) of the sign at all times.

7. The Exit Signs shall be located so that the listed legible viewing distance of:

   (a) Model numbers U04A3720 and UC02A4620 is not greater than 15.2 m (50 ft), or

   (b) Model numbers U01A3120, U02A3120, U01A3720 N, U01A3720 R, U01A3720 L, U02A3720 N, U02A3720 R; and U02A3720 L, UC01A3120, UC02A3120, UC01A3720 N, UC01A3720 R, UC01A3720 L, UC02A3720 N, UC02A3720 R, UC02A3720 L is not greater than 22.7 m (75 ft).

8. The Exit Signs shall have the following markings:

   a. Name of the manufacturer,

   b. UL/ULC 924,

   d. Model number,

   e. Legible viewing distance, and

   f. "CAUTION: minimum 5 foot-candle external un-filtered florescent illumination must be present on the sign face at all time of the buildings occupancy."

9. The Exit Signs shall be installed as per the manufacturer's instructions.

10. The Exit Signs are authorized for indoor applications only.

11. The Exit Signs shall not be exposed to direct sunlight.

12. The Exit Signs shall not be exposed to temperatures outside the range of 10^0 to 40^0 C (50^0 to 104^0 F).

13. The Exit Signs shall be cleaned with a damp cloth or as otherwise recommended by the manufacturer.

B. General Conditions

1. The use of the Exit Signs as described in Specific Terms and Conditions 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and except as specifically authorized herein, with the OBC.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in A. above; or

   (b) the occurrence of any of the events described in Conditions B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      I. the material, system or building design that is the subject matter of this Authorization;
      ii. the address of the applicant specified in Part 1 of this Authorization; or,
      iii. the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      I. does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or
      ii. provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any OBC provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 24th day of June 2004.

AUTHORIZATION REPORT- INSULSPAN™: Wall and Roof Sheathing Panels

1. Applicant

Insulspan
P.O. Box 38
9012 East US 223
Blissfield, Michigan
U.S.A 49228

Tel: (517) 486-4844
Fax: (517) 486-2056

2. Manufacturing Facilities

Insulspan
245 Jipon Street
Blissfield, Michigan
U.S.A 49228

3. Description

The Insulspan™, Wall and Roof Sheathing Panels (the "sheathing panels") are comprised of two sheets of 11.1 mm (7/16") oriented strand board (OSB) placed on the interior and exterior side of a modified expanded polystyrene (MEPS) foam core. The sheathing panels are bonded together with an adhesive under pressure into a sandwich configuration. The panels may be used as a sheathing material for wall and / or roof construction in buildings subject to the requirements of Part 9 of the Ontario Building Code.

The sheathing panels shall be installed over framing members spaced not greater than 600 mm (23-5/8") o.c.

The sheathing panels are intended for use as an exterior, non-loadbearing, nonstructural wall or roof sheathing material for use in a building envelope system. The sheathing panels are factory constructed and do not incorporate any vertical load bearing members and the bottom of panel is continuously supported.

The sheathing panels are available in widths sizes from 1220 mm to 2440 mm (4' to 8') with lengths up to 7315 mm (24'); and with MEPS thickness of 60 mm (3-5/8"), 111 mm (5-5/8"), 168 mm (7-3/8"), 238 mm (9-3/8") and 270 mm (11-3/8").

4. Authorization requested

The applicant sought a Building Materials Evaluation Commission (the "BMEC") authorization for the sheathing panels as an alternative to a wall, and roof sheathing material as required by Subsections 9.23.15. "Roof Sheathing", and 9.23.16. "Wall Sheathing" of 1997 Ontario Building Code, as amended (the "OBC").

5. Assessment

Reports and assessments provided by the applicant show that if the sheathing panels are designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the OBC will be provided.

The reports submitted, and reviewed were, but are not limited to:

1. Morrison Hershfield Report to the Building Materials Evaluation Commission, March 17, 2003.

2. PFS, TECO "PSF Test Report #95-07 Water Vapour Transmission (Permanence) of OSB ab EPS Sandwich Panels" prepared for Insulspan™, Inc July31, 1995.

10. Great Lake Insulspan™ Limited Warranty, Insulspan™ Building Panels.

11. Insulspan™ “Short Form Residential Specification”.

12. Insulspan™ “Master Guide Specification”.

13. Insulspan™ Manufacturer’s Information “The SIP Advantage” copyright 2000.

6. Authorization

Use of the Insulspan™ Wall and Roof Sheathing Panels are authorized as an alternative to a wall and roof sheathing material as required by Subsections 9.23.15. “Roof Sheathing”, and 9.23.16. “Wall Sheathing”, all other requirements pertaining to the installation are subject to the requirements of Part 9 and all other Parts of the OBC, and subject to the following terms and conditions:

A. Specific Terms & Conditions

1.0. General

1.1. This authorization is valid only for Insulspan™ wall and / or roof panels for use as sheathing only, in non-loadbearing applications.

1.2. The sheathing panels shall serve as an exterior sheathing material that is attached to the outside of the framing members spaced not greater than 600 mm (24") o.c. as specified by Sentence 9.23.1.1.(1). of the OBC.

1.3. The framing around openings such as, but not limited to doors, windows or dormers shall meet the requirements of OBC Subsections 9.23.12. “Framing Over Openings” and 9.23.13. “Roof and Ceiling Framing”, or Part 4 of the OBC.

1.4. The fasteners, attachments of the sheathing panels to the framing, and the framing around openings in the sheathing panels shall be designed in accordance with the requirements of Part 4 of the Ontario Building Code, the review shall be carried out by a Professional Engineers as defined in the Professional Engineers Act (Ontario); and the design calculations should be submitted to the Chief Building Official for review.

1.5. The sheathing panels may be used only where combustible construction is permitted.

1.6. The sheathing panels shall not be used where the wall and / or the roof assembly is required to have a fire resistance rating.

1.7. The sheathing panels shall be shipped, site handled, and stored as per the requirements of the manufacturer and as specified in the "Insulspan™ Installation Guideline for SIP Sheathing in Ontario."

1.8. The sheathing panels shall be identified by a permanent stamp or mark indicating the manufacturer's name or trademark.

1.9. The sheathing panels shall be modified or otherwise altered according to the manufacturer's instructions and as per the "Insulspan™ Installation Guideline for SIP Sheathing in Ontario."

1.10. As per the requirements of "Insulspan™ Installation Guideline for SIP Sheathing in Ontario", the sheathing panels shall be fastened to each other with a 75 mm (3") non-structural, non-loadbearing spline that fits into precut grooves; and the sheathing panels shall be sealed with an expanding foam which is compatible with all components of the panel and the adjacent materials.

2.0. Building Envelope and Thermal Requirements:

2.1. The sheathing panels shall meet the thermal requirement of Subsection 9.25.2. "Thermal Insulation" or Section 9.38. "Thermal Design" of the OBC.

2.2. Assemblies incorporating the sheathing panels shall have an air barrier installed as per the requirements of Subsection 9.25.3. "Air Barrier Systems" of the OBC.

2.3. Assemblies incorporating the sheathing panels shall have a vapour barrier installed as per the requirements of Subsection 9.25.4. "Vapour Barriers" of the OBC.

3.0. Walls:

3.1. The sheathing panels shall be covered with an exterior cladding material.

3.2. The cladding material shall be installed such that it conforms to the requirements Section 9.27. "Cladding" of the OBC.

3.3. The sheathing panels shall not be used in conjunction with stucco cladding.

4.0. Roofs:

4.1. The roofing system shall be vented as per the requirements of Subsection 9.19.1. "Venting" of the OBC.

4.2. The sheathing panels shall be covered with an approved roofing material as specified in Article 9.26.2.1. "Roofing Materials" of the OBC.

B. General Conditions

1. The use of the sheathing panels as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* (the "*Act*") as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Act* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any OBC provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29th day of April 2004.

BUILDING MATERIALS EVALUATION COMMISSION

_____

Tony Chow, Vice-Chair

BUILDING MATERIALS EVALUATION COMMISSION
(BMEC)
AUTHORIZATION REPORT

DATE OF AUTHORIZATION **MARCH 25, 2004**
BMEC AUTHORIZATION **BMEC # 04-04-296**
BMEC APPLICATION **#A2003-19**

BEAVER PLASTIC LTD.
The Terminator™

1. Applicant

Beaver Plastic Ltd.
12150- 160 Street
Edmonton, Alberta
T5V 1H5

Tel: (888) 453-5961
Fax: (780) 453-3955

2. Manufacturing Facilities

Beaver Plastic Ltd.
12150- 160 Street
Edmonton, Alberta
T5V 1H5

3. Description

The Terminator™ Insulated Chamber System (the Terminator™) is intended for use in a sewage system in lieu of absorption trenches constructed of stone and distribution pipe. The Terminator™ is made of gas permeable structural expanded polystyrene (EPS) insulation.

The Terminator™: Type A has an actual bottom width of 530 mm (20.8") and an actual height of 230 mm (9.0"). The thickness of the EPS insulation varies, ranging from 41 mm to 76 mm (1.6" to 3.0"). The Terminator™ does not have openings in the top or the sides.

4. Authorization Requested

The Applicant sought authorization for use of the Terminator™ as an alternative to the construction of stone and distribution pipe in as required by Section 8.7 of the 1997 Ontario Building Code, as amended (the “OBC”). The Applicant requested that the Terminator™ be used to replace stone and distribution pipe in absorption trenches and filter beds that are:

i. gravity fed,

ii. “dosed” (non-pressurized distribution system) and,

iii. pressurized.

Note: For the purposes of this authorization, “dosed” means a system in which effluent is pumped to the leaching bed either by pump or siphon, but the effluent is not pressurized within the leaching bed.

5. Assessment

Reports and assessments provided by the applicant show that if the Terminator™ is designed, performance tested, installed and maintained in accordance with the limitations in the manufacturer's instructions and the conditions stated in this authorization, a level of performance will be provided as required by the OBC, for absorption trenches in soil, in leaching bed fill or in a filter bed, whether gravity fed, pressurized or “dosed”.

Reports that were submitted and reviewed but not limited to:

1. Geothermal Analysis of the Terminator™ and Conventional Sewage Effluent Chambers, dated February 8, 2002.

2. AASHTO H-10 Testing Certification from EBA Engineering Constants Ltd

3. Manufacturer’s Literature

4. Installation Instruction dated March 3, 2003

5. Terminator™: Beaver Plastic Quality Control Manual

6. Product Approval Letters:

    - Province of Alberta
    - Province of Saskatchewan
    - Province of Manitoba
    - Yukon Territory

6. Authorization

The use of the Terminator™ is authorized in sewage systems within the scope of Part 8 of the OBC, as an alternative to stone and distribution pipes in absorption trenches and in filter beds, when installed in accordance with the manufacturer's recommendations, all other requirement pertaining to the installation of the Terminator™shall conform to the requirements of the OBC and is subject to the following Specific Terms and Conditions of this Authorization:

A. Specific Terms and Conditions

1. This Authorization is valid only for the Terminator™: Type A.

2. The Terminator™ shall be manufactured to AASHTO Standard H-10 for loading.

3. The length of the Terminator™ chamber shall be calculated such that every metre of distribution piping and stone, as specified in Articles 8.7.3.1. and 8.7.5.3., is equivalent to 1.2 m of Terminator™ chamber.

4. When the Terminator™ is installed in lieu of distribution piping and stone, the leaching beds must satisfy the general construction requirements specified in Articles 8.7.2.1., 8.7.4.2. and 8.7.5.3.

5. The minimum clearance distances required by Article 8.2.1.6. for distribution piping shall be met by the Terminator™.

6. When installed in lieu of distribution piping and stone in absorption trenches, the trenches for the Terminator™ shall be:

   (a) approximately the same length and not more than 30 m in length,

   (b) a minimum width of 500 mm,

   (c) at least 600 mm and not more than 900 mm in depth,

   (d) centred at least 1600 mm,

   (e) at least 900 mm at all points on the bottom of the trench, above the high ground water table, rock or soil with a percolation time greater than 50 minutes, and

(f) backfilled, after installation of the Terminator™, with leaching bed fill, so as to ensure that after the leaching bed fill settles, the surface of the leaching bed will not form any depressions.

(g) backfilled with a soil that does not contain heavy clay, silt or debris, and is manually compacted along the sides of the chamber to provide lateral support.

8. When installed in lieu of distribution piping and stone in filter beds, the lines of Terminator™ shall be evenly spaced over the surface of the filter medium to which the sewage effluent is applied, and the filter bed shall meet the following requirements:

   (a) the filter medium shall meet the requirements of Subsection 8.7.5. of the OBC,

   (b) the surface of the filter bed shall be at least 900 mm above the high ground water table, rock or soil with a percolation time greater than 50 minutes per centimetre as per Clause 8.7.3.2.(1)(e) of OBC.

9. When used in gravity fed conditions, the Terminator™ shall be installed in compliance with all the above-stated Specific Terms and Conditions and be:

   (a) installed level over the length of the trench,

   (b) securely connected, chamber to chamber, using the built-in latch,

   (c) free of structural damage and used full length (not cut),

   (d) equipped with end caps installed on both ends, and

   (e) equipped with a built-in splash plate at the inlet end of each chamber line, to prevent soil scouring.

10. Where the sewage effluent is "dosed" to the leaching bed by pumps or a siphon, the Terminator™ shall be installed to comply with all the above-stated Specific Terms and Conditions and:

    (a) the effluent is pumped to a header line or distribution box prior to entering the chambers, and,

    (b) a volume of effluent within the range of 3.5 - 8.0 litres per metre of Terminator™ , must be pumped within a time period not exceeding 15

minutes, to meet the requirements of Sentence 8.6.1.3.(4).

11. Where the sewage effluent is distributed through a pressurized system, the Terminator™ shall be installed:

    (a) to comply with Specific Terms and Conditions numbers 1. through 9. above, and,

    (b) with a minimum 1½ (38 mm) diameter pipe extending over the entire length of each trench, and such pipe:

        i. being specified by the manufacturer as acceptable for pressurized installations,

        ii. having minimum 6 mm diameter orifices, spaced over its length to ensure even distribution of effluent,

        iii. being supported in a manner as to ensure self-draining and prevent freezing of its contents,

        iv. having clean-outs installed at the downstream end of each chamber line, to allow the system to be serviced, and,

        v. receiving effluent from a treatment unit equipped with an effluent filter on the outlet, such effluent filter to be installed and sized in accordance with the manufacturer's recommendations.

B. General Conditions

1. The use of the Terminator™ must comply with the *Building Code Act, 1992 (the "Act")* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

(b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

i. the material, system or building design that is the subject matter of this Authorization;

ii. the address of the applicant specified in Part 1 of this Authorization; or,

iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the *Act* or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any OBC provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 25th day of March 2004.

DATE OF AUTHORIZATION	**MARCH 25, 2004**
BMEC AUTHORIZATION	**BMEC # 04-03-295**
BMEC APPLICATION	**#A2003-15**

COVER-ALL BUILDING SYSTEMS
Cover-All Membranes

1. Applicant

Cover-All Building Systems
3815 Wanuskewin Road
Saskatoon, Saskatchewan
S7P 1A4

Tel: (306) 657-2888
(877) 615-4776
Fax: (306) 664-7979

2. Manufacturing Facilities

Cover-All Building Systems
3815 Wanuskewin Road
Saskatoon, Saskatchewan
S7P 1A4

3. Description

The Cover-All Building System is a non pressurized building wherein the structure is composed of a steel framework to support the Cover-All Membranes, which are tensioned to provide a weather barrier.

The Cover-All Building System consists of a Vipersteel® clear span truss system, series TAS, IAS, LBS and TBS, covered with the Cover-All Membrane, a flexible roof covering of either a polyolefin, which has the product name Duraweave® FR, or a 1.09 mm (43 mil) Poly Vinyl Chloride (PVC).

The Cover-All Membranes meet both CAN/ULC-S109-M87 “Standard of Flame Tests of Flame-Resistant Fabrics and Films”; and NFPA 701-1997 “Method of Fire Test for Flame-Resistant Textiles and Films” standards.

4. Authorization requested

The Applicant sought a Building Materials Evaluation Commission (BMEC) Authorization for the Cover-All Membranes for use as a roof covering, only when used in conjunction with a Cover-All Building System, as defined in this Authorization, in lieu of the requirements of Sentence 3.1.15.1.(1). “Roof Covering Classification” of the 1997 Ontario Building Code, as amended or remade from time to time (OBC).

5. Assessment

Reports and assessments provided by the Applicant show that if the Cover-All Membranes are designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, and the specific terms and conditions stated in this Authorization, the level of performance required by the OBC will be provided.

Reports submitted, and reviewed but not limited to:

1. Cover-All Building Systems Detail Drawings, June 26, 2003 “Rated Exterior Wall Details.”

2. 2000 International Building Code, Chapter 31 “Special Construction” Section 3101.

3. Building Officials and Code Administrator International, Inc. Copyright 1998, Section 3103.0 “Membrane Structures.”

4. Standard Building Code 1999, Chapter 31 “Special Construction.”

5. 1997 Uniform Building Code Appendix Chapter 31, Division 11 “Membrane Structures.”

6. Letter of Guidance, Saskatchewan Municipal Affairs and Housing, February 15, 2002.

7. Manufacturer Information:

   (a) Capital District Salt
   (b) Empire Polo And Event Centre
   (c) Kingdom Projects Inc.
   (d) New Era Technologies

20. Manufacturer Information "Commercial Building Solutions", Cover-All Building Systems.

21. Manufacturer Information "The Industrial Building Solution", Cover-All Building Systems.

22. Manufacturer Information "The Tool of Choice for Road Safety: Cover-All Salt and Sand Storage Facilities", Cover-All Building Systems.

23. Correspondence to the BMEC dated July 15, 2003.

24. "Space Heating and Lighting Performance of a Titan Building", SRC Publication No. 11664-1C03, July 2003.

25. Intertek "Membrane - Covered Frame Structure Titan / Pinnacle Hurricane Testing", January 26, 2004.

26. "Ontario Snow Accumulation Study on Fabric Membrane Cover", Cover-All Building Systems, February 2004.

6. Authorization

The Cover-All Membranes are authorized for use as a roof covering, only when used in conjunction with a Cover-All Building System, in lieu of the requirements of Sentence 3.1.15.1.(1) "Roof Covering Classification" of the OBC;

all other requirements pertaining to the installation and construction are subject to the requirements of the OBC and subject to the following terms and conditions:

This Authorization is not intended to be used as an equivalent to CAN/ULC-S107-M87 where roof coverings are permitted to be used in the construction of traditional roofing systems Class A, B, and C as determined by CAN/ULC-S107-M87.

A. Specific Terms & Conditions

1. This Authorization is valid only for the use of Duraweave® FR and 1.09 mm (43 mil) PVC (the "Cover-All Membranes"), when they are used in conjunction with a Cover-All Building System.

2. In addition to the requirements of Article 2.3.1.1. of the OBC, the structural design shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario).

3. The Cover-All Membranes installed in conjunction with the building system, shall be constructed as per the requirements of Subsection 3.2.2. of the OBC.

4. Except as permitted in Article 3.2.2.17. of the OBC, the Cover-All Membranes shall not be used where the assembly is required to have a fire-resistance rating.

5. The Cover-All Membranes are authorized for use in combustible construction only.

6. The Cover-All Membranes shall not be used in a building more than 1 storey in building height.

7. The Cover-All Membranes shall not be used in the construction of Cover-All buildings where the major occupancy is Group B, C, or F Division 1, as defined by the OBC.

8. The Cover-All Membranes shall meet the following standards:

    a. CAN/ULC-S109-M87 "Standard for Flame Test of Flame-Resistant Fabrics and Films",

    b. NFPA 701-1997 "Methods of Fire Test for Flame Resistant Textiles and Films", and

    c. CAN/ULC-S102.2-M88 "Standard Test Method for Surface Burning Characteristics of Building Materials."

9. The Cover-All Membrane shall be installed by Cover-All Building Systems' approved installers.

10. The Cover-All Membranes shall be installed as per the Cover-All Building Systems Installation Manuals.

11. The Cover-All Membranes shall be identified by a permanent mark that indicates the manufacturer's name and registered trademark.

12. The Cover-All Membranes shall not have a flame spread rating more than 25.

13. The Cover-All Membranes, used in the construction of Cover-All buildings, shall have the spatial separation determined in accordance with Subsection 3.2.3. or Subsection 9.10.14. of the OBC, where the roof membrane becomes a part of the exposing building face.

B. General Conditions

1. The use of the Cover-All Membranes as described in A. Specific Terms and Conditions 1. must comply with the *Building Code Act, 1992 (BCA)* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in A. above; or

   (b) the occurrence of any of the events described in Conditions 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the *BCA* or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any OBC provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 25th day of March 2004.

BUILDING MATERIALS EVALUATION COMMISSION
(BMEC)
AUTHORIZATION REPORT

DATE OF AUTHORIZATION **January 29, 2004**
BMEC AUTHORIZATION **# 04-02-294**
BMEC APPLICATION **BMEC # A2003-20**

FALCON WATERFREE TECHNOLOGIES
Falcon Waterfree Urinal System

1. Applicant

Falcon Waterfree Technologies
10900 Wilshire Blvd #1500
Los Angles, CA
U.S.A., 90024

(310) 209-7314
(310) 209-7260

2. Manufacturing Facilities

Falcon Waterfree Technologies LLC
Manufacturing and Warehouse Facility
4470 44th Street
Grand Rapids, MI
U.S.A., 49512

3. Description

The Falcon Waterfree Technologies' Waterfree Urinals (the "Waterfree Urinal") are plumbing fixtures designed to be used in a washroom in lieu of a conventional water-fed urinal.

The Falcon Waterfree Urinal System has three models of waterfree urinals, two vitreous china models, F1000 and F2000; and one acrylic model, F-2000A. Each urinal has a integral trap with a liquid seal and outlet assembly for a connection to the sanitary sewer or drainage system. The plumbing fixture is designed to receive and convey only liquid waste through a trap seal and into the gravity drainage system without the use of water for such function. The integral trap consists of a patented sealtrap cartidge filled with the recommended volume of a proprietary sealant called Falcon ANER 01538. The differences between the urinals are aesthetic only.

The Falcon Waterfree Urinal System is comprised of five components: 1. the urinal body 2. the trap, or patented sealed cartridge 3. the housing for the trap 4. the unicoupler, and 5. the Falcon ANER 01538 trap seal.

4. Authorization Requested

The Applicant sought authorization for the use of their product as a waterfree urinal system in buildings of all types of construction wherever conventional urinals, as described in Article 7.6.4.2. “Plumbing Fixtures” of the 1997 Ontario Building Code, as amended or remade from time to time (the “OBC”), would be permitted to be installed under the of the OBC.

5. Assessment

Reports and assessments provided by the applicant show that if the Falcon Waterfree Urinal System is designed, performance tested and maintained in accordance with the manufacturer’s limitations and instructions stated in this authorization, the level of performance required by the OBC for conventional urinals will be provided:

Reports submitted and reviewed include but are not limited to:

1 Technical Background Information Memo relating BMEC A2003-20, Falcon Waterfree Urinal System dated November 23, 2003.

2 CSA Certificate of Compliance.

3 ICC Report for the International Plumbing Code.

4 IAPMO Listing for the Uniform Plumbing Code.

5 US State Approvals:

- (a) State of Arizona Approval
- (b) State of Massachusetts Approval
- (c) State of Rhode Island Approval

22. Virginia Tech Study on Pipe Corrosion.

23. UCLA Study on Pipe Corrosion.

24. US Federal Government Approval and Product Endorsement.

25. Manufacturer's Product and Installation Information:

    (a) F 1000 Product and Installation Instruction
    (b) F 2000 Product and Installation Instruction
    (c) F 2000A Product and Installation Instruction

26. Manufacturer's cleaning and Cartridge Change Instructions.

6. Authorization

The Falcon Waterfree Urinal System is authorized for use as a urinal in all locations, in buildings of all types of construction wherever a conventional urinal, as described in Article 7.6.4.2. “Plumbing Fixtures” of the OBC, would be permitted to be installed, and subject to the following specific terms and conditions:

A. Specific Terms and Conditions

1. This Authorization is valid only for Falcon Waterfree Technologies for the Falcon Waterfree Urinal models, F1000 and F2000; and F-2000A.

2. A copy of the maintenance instructions for Falcon Waterfree Urinals, patented sealed cartridge and Falcon ANER 01538 trap sealant and shall be submitted along with this Authorization when applying for a building permit.

3. A permanent sign, located in a conspicuous location, indicating the maintenance schedules, as they are referenced in A.2. of this Authorization, shall be posted in each room that a Waterfree Urinal is installed.

4. The Waterfree Urinals must be marked to indicate that they conform to the following standards:

(a)	vitreous china models	CSA/ASME A112.19.2.2M
(b)	acrylic model	CSA/ANSI Z124.9

5. The Waterfree Urinal shall be installed in accordance with the manufacturer’s instructions.

6. The manufacturer shall provide training for the proper use, operation and maintenance of the device.

7. The plumbing system that the Waterfree Urinal forms a part of shall be designed as per Section 7.5. “Venting” of the OBC.

8. The Waterfree Urinal shall be connected to a drain waste pipe that is designed as per Subsections 7.4.9. “Size of Drain Pipes” and 7.4.10. “Hydraulic Loads” of the OBC.

9. The Waterfree Urinal is considered to have satisfied the requirements of Subsection 7.2.3. “Traps and Interceptors” of the OBC when:

   (a) installed with an patented sealed cartridge as described Part 3 of this Authorization, and

(b) used in conjunction with the manufacturer's trap seal liquid, Falcon ANER 01538, or other similar liquids approved by the manufacturer.

10. Double trapping of the Waterfree Urinal is not permitted.

11. The Waterfree Urinal shall conform to the flame spread and smoke development requirements of the OBC.

B. General Conditions

1. The use of Waterfree Urinal System as described in 6.A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992 (BCA)* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in A. above; or

   (b) the occurrence of any of the events described in Conditions B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the *BCA* or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any OBC provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29th day of January 2004.

AUTHORIZATION REPORT- Super Foam Roof Panels Assembly

1. Applicant

Patio Enclosures, Inc.
700 Highland Road, East
Macedonia, Ohio
USA
44056

Tel: (330) 468-0700
Fax: (330) 467-4297

2. Manufacturing Facilities

Patio Enclosures, Inc.
700 Highland Road, East
Macedonia, Ohio
USA
44056

Tel: (330) 468-0700
Fax: (330) 467-4297

3. Description

The Patio Enclosure, Inc. Super Foam Roof Panels (the "roof panels") may be used in the construction of sunroom additions to residential occupancy buildings. The panels are a nominal 76 mm (3") or 152 mm (6") thick laminated roof panels joined with aluminum I-beams for the use on roofs of patio enclosures.

* The factory assembled roof panel consists of a 0.6 mm (0.025") thick aluminum skins on the top and bottom, one layer of 11 mm (7/16") Oriented Strand Board (OSB) on the bottom which is bonded to a 24 kg/m^3 (1.5 pcf) foam core pre-formed expanded polystyrene (EPS). The roof panel is installed by fitting the panel between the flanges of a 6063-T6 extruded aluminum I-beam at 900 mm (36") o.c. Variations on the roof panels may exist where the manufacturer installs skylights or glass roof panels.

The adhesive, Dow 795, is applied in a continuous bead along the inside and the top and bottom of the aluminum I-beam. The roof panel is then fitted between the top and bottom flanges of the aluminum I-beam providing a continuous bearing surface along the length of the panel. The roof panels are fastened through the top flanges of the aluminum I-beam with #8 Tek screws at 600 mm (24") o.c. On the bottom flange the roof panels are fastened with #8 Tek screws at the hanger and header location.

4. Authorization requested

The applicant sought authorization for the use of the innovative roof panels as an acceptable roof system for roofs of patio enclosures, as the panels are described in Part 3 "Description" of this authorization, as an acceptable system permitted to be used in conjunction with 1997 Ontario Building Code, as amended (OBC).

5. Assessment

Reports and assessments provided by the applicant show that if the roof panel is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the OBC will be provided.

Reports submitted, and reviewed, but not limited to:

6. Authorization

The roof panels are authorized for use as an innovative system designed for use as an acceptable roof system for patio enclosures; all other requirements pertaining to the installation of the roof panels shall be subject to the requirements of Part 9 and all other Parts of the OBC; and subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This authorization is valid only for Patio Enclosures, Inc.

2. The structural design and general review of the roof panels shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario). The Professional Engineer shall provide the chief building official with a document certifying that the installation conforms with this authorization.

3. The structural system supporting the Authorized roof panels shall have sufficient structural capacity as required OBC.

4. The roof panels shall be limited to residential occupancy buildings that are subject to the requirements Part 9 of the OBC.

5. The roof panels shall not be used where the roof assembly is required to have a fire resistance rating.

6. The 152 mm (6") roof panels are deemed to be in conformance with the thermal requirement of Subsection 9.25.2. “Thermal Insulation.”

7. The roof panels need not have an air barrier, in addition to the aluminum skin, installed as per the requirements of Subsection 9.25.3. “Air Barrier Systems” of the OBC; and to prevent water infiltration, the exterior roof panels shall be caulked to form a continuous seal.

8. The roof panels need not have a vapour barrier, in addition to the aluminum skin, installed in conformance with the requirements of Subsection 9.25.4. “Vapour Barriers” of the OBC; and to maintain the vapour barrier, except for the fascia connection, the interior roof panels shall be caulked to form a continuous seal.

9. The panels shall be installed as per the requirements of ICBO Evaluations Services Inc. issued May 1, 2003.

10. The sheathing panels shall be identified by a permanent stamp, sticker or mark indicating the manufacturer’s name or trademark.

11. If the roof panel incorporates an opening within the panel, or is modified to accommodate a penetration within the panel, then additional testing demonstrating that the modified roof panels conform to the OBC shall be submitted to the chief building official for review.

B. General Conditions

1. The use of the roof panels as described in A. Specific Terms and Conditions 1. must comply with the *Building Code Act, 1992 (BCA)* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in A. above; or

   (b) the occurrence of any of the events described in Conditions B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *BCA* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any OBC provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 29th day of January 2004.

AUTHORIZATION REPORT

DATE OF AUTHORIZATION **November 27, 2003**
BMEC AUTHORIZATION **# 03-13-292**
BMEC APPLICATION **BMEC #A2003-18**

REB STORAGE SYSTEMS INTERNATIONAL
Shelf and Rack Storage System

1. Applicant

REB Storage Systems International
4556 W. Grand Avenue
Chicago, Illinios
U.S.A.
60639

Tel: (800) 252-5955
Fax: (773) 252-0303

2. Manufacturing Facilities

Power Storage Products
1746 N. Kolmar Avenue
Chicago, Illinios
U.S.A.
60639

3. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the 1997 Ontario Building Code, as amended or remade from time to time (OBC) and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the OBC.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for REB Storage Systems International.

Use and Occupancy

2.1 Except as required by 3.4. of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the OBC.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time (OFC).

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the OBC.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Class I, II, III and IV commodities as defined in NFPA 13 -1999 as amended.

3.5 Lighting levels of walkways and platforms shall conform to the OBC.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the OBC.

3.7 Guards and toe boards shall be installed in accordance with the OBC.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the OBC.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 “Emergency Planning” of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the OBC except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a “time-based egress analysis” undertaken and sealed by a Professional Engineer or Architect as defined in the OBC using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the OBC shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2). of the OBC, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the required Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching ‘at-level’ conveyor cross-overs shall be marked in accordance with the required Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time *(BCA)* and, except as specifically authorized herein, with the OBC.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or

   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *BCA* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

   (d) any OBC provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

JESSUP MANUFACTURING COMPANY
Glo Brite® Photoluminescent Exit Signs

1. Applicant

Jessup Manufacturing Company
P.O. Box 366
Mc Henry, Illinois
60051
U.S.A.

Tel: (815) 385-6650
Fax: (815) 385-0079

2. Manufacturing Facilities

Jessup Manufacturing Company
2815 West Route 120
Mc Henry, Illinois
60050
U.S.A.

3. Description

The Glo Brite® Exit Signs (the "Exit Signs") 7000 series, model numbers 7011, 7011-B, 7012-B, 7310, 7210, 7211, 7013, 7013-B, and 7014-B, are Exit Signs that are available in both framed and frameless styles. The Exit Signs have a photoluminescent panel consisting of a rigid Poly Vinyl Chloride (PVC) sheet blended with a strontium oxide photoluminescent pigment that emits light through the absorption of at least 54 lux (5 foot candles) of ambient illumination. The reported legible viewing distance of the Exit Sign is 15.2 m (50 ft).

The framed Exit Sign consists of a photoluminescent placard inside a red powdered coated frame. The frame is provided with the word "EXIT" or "SORTIE" and optional directional indicator knockouts. The framed Exit Sign is available in single or double sided and may be ceiling or wall mounted.

The frameless Exit Sign consists of a photoluminescent background and opaque letters spelling the word "EXIT" or "SORTIE" in red only. Opaque directional indicators are optional and may be included at one or both sides of the exit sign. The substrate material is a semi-rigid PVC and it is mechanically mounted to the surface. The frameless Exit Sign may be ceiling or wall mounted.

4. Authorization Requested

The applicant sought a Building Materials Evaluation Commission (BMEC) authorization for the Exit Signs, series 7000 as a means of egress identification under Subsection 3.4.5. “Exit Signs”, with conditions and limitations, equivalent to the requirements of 1997 Ontario Building Code, as amended and remade from time to time (OBC).

5. Assessment

Reports and assessments provided by the applicant show that if the Exit Signs are designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the OBC will be provided.

Reports submitted, and reviewed, but not limited are to:

15. Letter of Approval from the Office of the Fire Marshall in the State of Indiana, April 19, 2002.

16. ULC correspondence re. File E230912, dated September 23, 2003.

17. Material Safety Data Sheet, LOC 20126/7/8.

18. ULC correspondence re. BMEC A2003-16, dated November 18, 2003.

6. Authorization

The Exit Signs series 7000, model number 7011, 7011-B, 7012-B, 7310, 7210, 7211, 7013, 7013-B, and 7014-B are authorized for use as a means of egress identification under Subsection 3.4.5. “Exit Signs”, all other requirements pertaining to the installation are subject to the requirements of the OBC, and subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This Authorization is valid only for Exit Signs model numbers 7011, 7011-B, 7012-B, 7310, 7210, 7211, 7013, 7013-B, and 7014-B .

2. Sortie Signs, model numbers 7211, 7013, 7013-B, and 7014-B, shall only be installed adjacent to Exit Signs, model numbers 7011, 7011-B, 7012-B, 7310, and 7210.

3. The Exit Signs are not required to be provided with an emergency power supply as described in Sentence 3.2.7.4.(1). of the OBC.

* 4. The Exit Signs require a minimum of 54 lux (5 ft candles) of constant and continuous external non-filtered fluorescence, mercury vapour or metal halide lighting to illuminate the face(s) of the signs at all times.

5. The Exit Signs may only be used in buildings that are not required to have an emergency power supply greater than 1 h, for emergency lighting as described in the Article 3.2.7.4 of the OBC.

6. The Exit Signs shall be located so that the legible viewing distance of 15.2 m (50 ft) is not exceeded.

7. The Exit Signs shall have the following markings:

   a. Name of the manufacturer,

   b. UL/ULC 924,

   c. Expiration date,

   d. Model number,

   e. Legible viewing distance, and

   f. "CAUTION: minimum 5 foot candle external non-filtered florescent, mercury vapour or metal halide illumination must be continuously present on the face(s) of this sign."

8. The Exit Signs shall be installed as per the manufacturer's instructions.

9. The Exit Signs are authorized for interior applications only.

10. The Exit Signs shall not be exposed to direct sunlight.

11. The Exit Signs shall not be exposed to temperatures outside the range of 10^0 to 40^0 C (50^0 to 104^0 F).

12. The Exit Signs shall be cleaned with a damp cloth or as otherwise recommended by the manufacturer.

B. General Conditions

1. The use of the Exit Signs as described in Specific Terms and Conditions 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time *(BCA)* and except as specifically authorized herein, with the OBC.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in A. above; or

(b) the occurrence of any of the events described in Conditions B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

i. the material, system or building design that is the subject matter of this Authorization;

ii. the address of the applicant specified in Part 1 of this Authorization; or,

iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the *BCA* or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any OBC provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto on this 27th day of May 2004.

BUILDING MATERIALS EVALUATION COMMISSION
AUTHORIZATION REPORT

DATE OF AUTHORIZATION **October 30, 2003**
BMEC REFERENCE **BMEC # 03-11-290**
BMEC APPLICATION **BMEC #A2003-17**

PHOENIX RACK AND STORAGE SYSTEM
Shelf and Rack Storage System

1. Applicant

Phoenix Rack and Storage Systems Inc.
181 Rue Barr Street
St. Laurent, Quebec
H4T 1W6

Tel: (514) 735-5431
Fax: (514) 735-8558

2. Manufacturing Facilities

Phoenix Rack and Storage Systems Inc.
181 Rue Barr Street
St. Laurent, Quebec
H4T 1W6

3. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the 1997 Ontario Building Code, as amended (OBC) and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the OBC.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Phoenix Rack and Storage Systems Inc.

Use and Occupancy

2.1 Except as where more restrictively provided for in 3.4. and 3.5. in the following, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, II and IV commodities, Group A, B, C plastics and rubber tires as defined in NFPA-13-1999, and not for production, manufacturing, assembly/disassembly or ancillary administrative functions; where the shelf and rack storage system incorporates the storage of rubber tires, such storage shall conform to the requirements of Subsection 3.3.1. “Indoor Tire Storage” of the Ontario Fire Code, Ontario Regulation 388/97, as amended or remade from time to time

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the OBC, as amended or remade from time to time.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the OBC as remade from time to time.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Classes I, II and III commodities as defined in NFPA 13 -1999 as amended.

3.5. Where Class I, II, III, and IV commodities and Group A, B, C, plastics and rubber tires as defined in NFPA 13-1999 are stored, the maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 7 m.

3.6 Lighting levels of walkways and platforms shall conform to the OBC as amended or remade from time to time.

3.7 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2) and 3.2.7.4.(1) respectively of the OBC as amended or remade from time to time.

3.8 Guards and toe boards shall be installed in accordance with the OBC as amended or remade from time to time.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs A 4.3 and A 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph A 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 - 1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the OBC.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

4.10 Regardless of the occupant load, the requirements of Section 2.8. “Emergency Planning” of the Ontario Fire Code, Ontario Regulation 388/97, as amended or remade from time to time, shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the OBC except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m^2 in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the OBC using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)

V_p = Vertical travel distance on the shelf and rack storage (m)

H_m = Horizontal travel distance on the main floor (m)

N_{lg} = Number of lift gates in the means of egress

N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the OBC shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the OBC, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the required Fire Safety Plan, as required by 4.10 of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the required Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 6. A. above; or

   (b) the occurrence of any of the events described in Sections 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this Authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section 6 A 1.1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 6. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Dated at Toronto on this 30th day of October 2003.

AUTHORIZATION REPORT: Trap Guard™ Valve

1. Applicant

Proset Systems, Inc.
1355 Capital Circle
Lawrenceville, Georgia
30043, USA

Tel: (770) 339 -1782
Fax: (770) 339 -1784
Web: www.trapguard.com

2. Manufacturing Facilities

Proset Plastics, Inc.
1355 Capital Circle
Lawrenceville, Georgia
30043, USA

Proset Plastics, Inc.
519 Honeysuckle Road
Spartanburg, South Carolina
29303, USA

3. Description

The Proset Systems, Inc. Trap Guard™ Valve is made of a soft, flexible elastomeric PVC material molded to a ridge PVC fitting in the shape of a duck's bill, open at the top with a special curl closure at the bottom.

The Trap Guard™ Valve is used inside of an approved floor drain fixture. The smooth flexible Trap Guard™ Valve surface allows wastewater to open and adequately discharge the fixture through its interior and close after the wastewater discharges to prevent possible sewer gas emissions.

4. Authorization requested

The applicant sought a Building Materials Evaluation Commission (BMEC) authorization for the Trap Guard™ Valve as an equally effective means of providing a trap seal primer, with limitations, equivalent to the requirements of 1997 Ontario Building Code, Sentence 7.4.5.5.(1).

5. Assessment

Reports and assessments provided by the applicant show that if the Trap Guard™ Valve is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the 1997 Ontario Building ode will be provided.

The reports submitted, and reviewed, but were not limited to:

1. Southern Building Code Congress International, Report Number 2218, copyrighted 2002.

2. Curney & Ivey Engineering Inc. Test Report, January 19, 2002, Subject Engineering Report 22007, Testing of Trap Guard."

3. Intertek Testing Services, Issued January 31, 2003, Revised March 26, 2003, Listing Report Number 478-3031903-01/03 " A Model " Proset Systems, Inc. Trap Guard™ Floor Drain."

4. Installation Instructions.

5. Letter of Approval, City of Philadelphia, July 3, 2003.

6. Letter of Approval, City of Winnipeg, July 21, 2003.

* 7. Forest Mechanical Inc., Engineer's letter, dated August 18, 2005.

6. Authorization

The Trap Guard™ Valve is authorized for use as an equally effective means of providing a trap seal primer, all other requirements pertaining to the installation are subject to the requirements of the 1997 Ontario Building Code; and subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This Authorization is valid only for Proset Systems, Inc. Trap Guard™ Valve, for 2", 3" and 4" diameter floor drain sizes.

2. The Proset Systems, Inc. Trap Guard™ Valve shall be installed flush with the finished floor.

3. If a Proset Systems, Inc. Trap Guard™ Valve is installed, then it shall not reduce the flow through a pipe by more than 10 percent.

4. The strainer which covers the Proset Systems, Inc. Trap Guard™ Valve shall have the following label “Trap Guard™ Protection Inside”; the label shall be:

   (a) permanently attached,

   (b) waterproof,

   (c) adhered in a manner that it does not obstruct the strainer’s flow, and

   (d) installed on a contrasting background.

5. The Proset Systems, Inc. Trap Guard™ Valve shall be accessible by removing the strainer top.

6. The Proset Systems, Inc. Trap Guard™ Valve shall not be installed in systems where the water temperature discharge is greater than 93.3^0 C (200^0 F) or higher.

* 7. The Proset Systems, Inc. Trap Guard™ Valve may be installed in a floor drain system that complies with CSA B 79, or floor drains installed in conformance with the Building Code.

8. The Proset Systems, Inc. Trap Guard™ Valve shall not be installed where the discharge sewage or waste may damage or impair the fitting.

B. General Conditions

1. The use of the Proset Systems, Inc. Trap Guard™ Valve as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      ii. provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Dated at Toronto this 27 day of October 2005.

3. Description

The Haworth Ltd Nexus™ Floor System consists of steel encapsulated fibreboard panels supported on pedestals that are positioned by means of interlocking plastic webbing. The system functions as a low-profile raised floor system providing access for electrical and telecommunications accessories, primarily in commercial offices interiors.

4. Authorization requested

The applicant sought a Building Materials Evaluation Commission (BMEC) authorization for the Nexus™ Floor System where the plastic webbing would be considered, with limitations, equivalent to the requirements of OBC Sentence 3.1.5.8.(2). “Combustible Flooring Elements.”

5. Assessment

Reports and assessments provided by the applicant show that if the Nexus™ Floor System is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the OBC will be provided. Reports submitted, and reviewed:

1. SMED International Specifications, Constructive Solutions “Section 102070 Cellular Access Floor”, 05/2002.

6. Authorization

Use of the Haworth Ltd. Nexus™ Floor System is authorized for use as an access floor system incorporating plastic webbing and is considered, with limitations, equivalent to the requirements of OBC Sentence 3.1.5.8.(2); all other requirements pertaining to the installation are subject to the requirements of the OBC, and are subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This authorization is valid only for the Haworth Ltd. Nexus™ Floor System.

2. The Nexus™ Floor System shall only be installed in Group D, occupancies as it is defined in the OBC.

3. The space under the Nexus™ Floor system shall be subdivided into areas not larger than 10 m^2, and shall be fired stopped as per the requirements of OBC Sentence 3.1.11.3.(2).

4. The space under the Nexus™ Floor System shall not be used for storage.

5. The space under the Nexus™ Floor System shall not be used for air handling or as a plenum.

6. The Nexus™ Floor System shall not be designed to carry a uniform live load greater than 16 kPa.

7. The Nexus™ Cellular System shall be installed as per the prescribed “Nexus™ Installation Instructions, October 2001.”

8. The Nexus™ Floor System shall be installed on a noncombustible, floor or subfloor that is smooth, clean, dry, and flat with a maximum allowable deviation of 10 mm per 3000 mm horizontal run and with no discontinuities in the surface.

9. Fibre optic cables and electrical wires located in the space under the Nexus™ Floor System shall not be considered as being protected against exposure to fire.

10. Where the Nexus™ Floor System is cut during field installations the exposed edge shall be:

    (a) substantially covered by an electrical devise box protruding through the floor panel, or

    (b) positioned to abut interior construction surfaces and separated from the underfloor space by a continuous steel support channel, or

    (c) covered by an overlapping steel channel, minimum 30 gauge, which substantially covers the cut edge of the panel.

B. General Conditions

1. The use of the Haworth Ltd. Nexus™ Floor System as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

    (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

    (a) any change has been made to:

        i. the material, system or building design that is the subject matter of this Authorization;

ii. the address of the applicant specified in Part 1 of this Authorization; or,

iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any OBC provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Amended at Toronto on this 30th day of October 2004.

AUTHORIZATION REPORT- LIFESTYLE SUNROOMS: Structural Insulated Panels

1. Applicant

Lifestyle Sunrooms Inc.
239 Station Street
Ajax, Ontario
L1S 1S3

Tel: (905) 686-9607
Fax: (905) 686-4798

2. Manufacturing Facilities

Lifestyle Sunrooms Inc.
239 Station Street
Ajax, Ontario
L1S 1S3

Tel: (905) 686-9607
Fax: (905) 686-4798

3. Description

* The Lifestyle Sunroom's structural insulated panels may be used in the construction of unheated sunroom additions to residential occupancy buildings. The structural insulated panels are available in two different panel thicknesses. The nominal overall thickness of the panels are 76 mm (3") and 146 mm (5-3/4"). The panels are constructed in accordance with the assemblies noted in the table below. All components are secured together by a structural adhesive.

Lifestyle Sunrooms		
Component	**76 mm (3") Panel**	**146 mm (5-3/4") Panel**
Aluminum Sheathing	0.8 mm (0.032")	0.8 mm (0.032")
Polystyrene Core	60 mm (2-3/8")	127 mm (5")
Hardboard	3 mm (1/8")	3 mm (1/8")
Oriented Strand Board	11 mm (7/16")	11 mm (7/16")
Aluminum Sheathing	0.8 mm (0.032")	0.8 mm (0.032")

Both sides of the panel are covered with a 0.8 mm (0.032“) embossed aluminum skin. The structural adhesive, Mor-Ad, is used in the construction of the panels and it is moisture cured. The panels are provided in lengths from 2133 mm (7'-0“) to 3658 mm (12'-0") long for the 76 mm (3") thick panels, and in lengths from 2133 mm (7'-0“) to 4572 mm (15'-0") feet for the 146 mm (5-3/4") panels. The OSB and hardboard are located on one side of the panel between the foam core and the aluminum sheathing. The panel shall be installed so that the OSB and hardboard are located on the interior side of the Lifestyle Sunroom.

4. Authorization requested

The applicant sought authorization for the use of the Lifestyle Sunroom as an unheated sunroom, which may be an addition to a residential occupancy building that is subject to requirements of Part 9 of the 1997 Ontario Building Code, as amended (OBC).

5. Assessment

Reports and assessments provided by the applicant show that if the Lifestyle Sunroom panel is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations; and the specific terms and conditions stated in this authorization, the level of performance required by the OBC will be provided.

Reports submitted, and reviewed:

1. Lifestyle Sunrooms manufacturer information.

2. Thyssen Krupp "Certified Aluminum Chemical and Mechanical Analysis", August 20, 2003.

12. Trow Consulting Engineers Ltd. Reports "Load Testing of Sandwich Roof Panels Manufactured by Lifestyle Sunrooms, Ajax Ontario" revised March 18, 2003.

13. Trow Consulting Engineers Ltd. correspondence "Lifestyle Sunrooms panels Compressive Creep of the Polystyrene Foam Core", March 18, 2003.

15. City of Toronto correspondence re: Lifestyle Sunrooms OBC Approval for Roof Panels, March 25, 2003.

16. Quality Control Documentation.

17. Excerpt of the Minutes of Meeting, Toronto Urban Development Services, February 2, 2003.

18. Trow Consulting Engineers Ltd. correspondence "Sample Deflection Calculations for the Lifestyles Sunrooms Roof Panels", July 7, 2003.

6. Authorization

The Lifestyle Sunroom panels are authorized for use in the construction of unheated sunrooms, which may be an addition to a residential occupancy building, all other requirements pertaining to the installation are subject to the requirements of Part 9 of the OBC, and subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This authorization is valid only for Lifestyle Sunrooms Inc. (Lifestyle Sunrooms).

2. The structural design and general review of the Lifestyle Sunrooms shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario). The Professional Engineer shall provide the chief building official with a document certifying that the installation conforms with this authorization.

3. The Lifestyle Sunrooms shall be limited to residential occupancies subject to the requirements of Part 9 of the OBC.

4. The panels shall not be used where the wall and / or roof assemblies are required to have a fire resistance rating.

5. The Lifestyle Sunroom shall be supported on a foundation designed and constructed in accordance with the requirements of Part 9 or Part 4 of the OBC.

6. The Lifestyle Sunrooms shall only be used in the construction of unheated spaces.

7. The panels need not meet the following OBC requirements:

   (a) Subsection 9.25.2. “Thermal Insulation” and Section 9.38. “Thermal Design”

   (b) Subsection 9.25.3. “Air Barrier Systems”

   (c) Subsection 9.25.4. “Vapour Barriers”

8. The wall panels shall not support the load of the roof panels; the roof panels shall be attached to a structural frame.

B. General Conditions

1. The use of the Lifestyle Sunroom Panels as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or
   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or
      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

RenewABILITY Energy Inc.
Commercial Drainwater Heat Recovery Systems

1. Applicant

* Renewability Energy Inc.
2-60 Baffin Place
Waterloo, Ontario
N2V 1Z7

Tel: (519) 885-0283
Fax: (519) 885-7007

2. Manufacturing Facilities

* Renewability Energy Inc.
2-60 Baffin Place
Waterloo, Ontario
N2V 1Z7

3. Description

RenewABILITY Energy Inc. has two types of Commercial Drainwater Heat Recovery Systems (Heat Recovery System), which are the gravity fed systems and the pumped systems. Both Heat Recovery Systems consist of a heat exchanger which transfers waste heat from the grey drainwater to the colder potable water stream. Required venting is installed onto the heat exchanger on-site and the diverted drainwater flow is returned to the standard drain system.

Gravity System: The Heat Recovery System has a flow splitting manifold, which is designed to maintain an engineered cross sectional area as the drainwater flows thought it.

Pumped System: The Heat Recovery System also consists of a tank, a pump and a pressurized flow splitting manifold. The tank gathers grey drainwater and then pumps it into the pressurized manifold which feeds the vertical heat exchanger.

4. Authorization requested

The applicant sought a Building Materials Evaluation Commission (BMEC) authorization for the Heat Recovery System as an innovative system designed for use as a wastewater heat recovery system on drainage pipes that are installed in commercial buildings and convey wastewater that is free from solids and does not contain sewage derived from sanitary units.

5. Assessment

Reports and assessments provided by the applicant show that if the Heat Recovery System is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the OBC will be provided.

Reports submitted, and reviewed:

1. Letter correspondence dated March 12, 2003, from the Code Development and Training Section of the Ministry of Municipal Affairs and Housing.

2. GFX Floor Mounted System Installation Documentation, dated April 2003.

3. Pumped System Installation Documentation, dated February 2003.

4. Correspondence dated March 13, 2003, from the City of Kitchener.

5. Correspondence dated April 7, 2003, from the City of Toronto.

6. Correspondence dated February 6, 2003 from the Alberta Government.

7. Natural Resources Canada, CANMET Energy Technology Centre “Energy Credits for the Use of the Drainwater Heat Recovery System for Houses.”

8. F.E.M.P. United States Department of Energy “Heat Recovery from Wastewater Using Gravity-Film Heat Exchangers.”

9. UL Notice of Authorization and Testing, ”Notice of Authorization to Apply the UL Mark”, March 8, 2001.

10. United States Department of Energy ”New technologies Keeps Companies and Consumers in Hot Water”, April 2000.

12. Installation Instruction for GFX Multiple-Pipe Gravity Fed Systems for Wall Mounted Units."

13. Doucette Industries, Quality Manual.

6. Authorization

Use of the Heat Recovery System is authorized for use as an innovative system designed for use as a wastewater heat recovery system on drainage pipes that are installed in commercial buildings and convey wastewater that is free from solids and does not contain sewage derived from sanitary units; all other requirements pertaining to the installation of the Heat Recovery System shall conform to the requirements of Part 7 and all other Parts of the 1997 Ontario Building Code as amended (OBC), and subject to the following terms and conditions:

A. Specific Terms & Conditions

1. This authorization is valid only for the RenewABILITY Energy Inc. Commercial Drainwater Heat Recovery System.

2. The design and general review of the Heat Recovery System shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario); the Professional Engineer shall provide the chief building official with a document certifying that the installation conforms with this authorization.

3. The Commercial Drainwater Heat Recovery System shall not be considered in contravention to OBC Article 7.4.9.1. when used on drain pipes that carry wastewater from showers, dishwashers, clothes washers or other similar applications where the wastewater is free of solids and shall not contain sewage derived from sanitary units.

4. In addition to the to the related standards and requirements as outlined in Subsection 7.2.7. and Article 7.2.9.2. of the OBC, the Heat Recovery System shall conform to the following standards:

   (a) the copper drainpipe shall conform to ASTM B306, and

   (b) the copper freshwater pipe shall be type L tube conforming to ASTM B88.

5. The drainage system shall be provided with cleanouts that will permit the cleaning of the Heat Recovery System and the entire drainage system.

6. In addition to the requirements of the *Building Code Act, 1992,* RenewABILITY Energy Inc. shall supply the owner and Chief Building Official with the following:

(a) detailed mechanical drawings and documents denoting the installation of the Heat Recovery System with respect to possible future renovation and retrofit of the system, and

(b) the necessary manuals and documents outlining maintenance responsibilities and defining the system's maintenance protocol.

7. Permanently located on the Heat Recovery System in a minimum of 3 separate locations, and one on the upstream portion of the drainage system in a conspicuous location, shall be a mark or label indicating a minimum of the following information:

(a) Commercial Drainwater Heat Recovery System,

(b) Contact Information: company name, and telephone number, and

(c) "Not approved for solids or sanitary unit discharge"

8. The Heat Recovery Systems shall not be enclosed in a wall, floor, or ceiling assembly, and shall be readily accessible for maintenance inspection.

B. General Conditions

1. The use of the Renewability Energy Inc. Commercial Drainwater Heat Recovery System as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

(b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

i. the material, system or building design that is the subject matter of this Authorization;

ii. the address of the applicant specified in Part 1 of this Authorization; or,

iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Amended at Toronto on this 30th day of October 2004

BUILDING MATERIALS EVALUATION COMMISSION (BMEC) AUTHORIZATION REPORT

DATE OF AUTHORIZATION **JULY 31, 2003**
BMEC AUTHORIZATION **03-06-285**
BMEC APPLICATION **BMEC #A2003-12**

Concept Storage Solutions
Shelf and Rack Storage System

1. Applicant

Concept Storage Solutions
231 Millway Avenue, Unit #20
Concord, Ontario
L4K 3W7

Tel: (905) 660 -7848
Fax: (905) 660 -7849

2. Manufacturing Facilities

Concept Storage Solutions
231 Millway Avenue, Unit #20
Concord, Ontario
L4K 3W7

3. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the 1997 Ontario Building Code, as amended (OBC) and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the OBC.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Concept Storage Solutions.

Use and Occupancy

2.1 Except as required by 6.A.3.4. of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the OBC, as amended or remade from time to time.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the OBC as remade from time to time.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Classes I, II and III commodities as defined in NFPA 13 -1999 as amended.

3.5 Lighting levels of walkways and platforms shall conform to the OBC as remade from time to time.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2) and 3.2.7.4.(1) respectively of the OBC as remade from time to time.

3.7 Guards and toe boards shall be installed in accordance with the OBC as remade from time to time.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs A 4.3 and A 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph A 2.1 or clause c) of paragraph 3.4. above, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 - 1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the OBC.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the OBC except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m^2 in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a “time-based egress analysis” undertaken and sealed by a Professional Engineer or Architect as defined in the OBC using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the OBC shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the OBC, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching ‘at-level’ conveyor cross-overs shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 6. A. above; or

(b) the occurrence of any of the events described in Sections 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1 of this Authorization; or,

(iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section 6 A 1.1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 6. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Dated at Toronto this 31st day of July, 2003.

BUILDING MATERIALS EVALUATION COMMISSION
(BMEC)
AUTHORIZATION REPORT

DATE OF AUTHORIZATION **JULY 31, 2003**
BMEC AUTHORIZATION **BMEC # 03-05-284**
BMEC APPLICATION **BMEC #A2003-11**

Rack Net-Works
Shelf and Rack Storage System

1. Applicant

Rack Net-Works
2005840 Ontario Inc.
1403 Malibou Terrace
Mississauga, Ontario
L5J 4B9

Tel: (905) 855-8704
Fax: (905) 855 8714

2. Manufacturing Facilities

Rack Net-Works
2005840 Ontario Inc.
1403 Malibou Terrace
Mississauga, Ontario
L5J 4B9

3. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the 1997 Ontario Building Code as amended (OBC) and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the OBC.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Rack Net-Works.

Use and Occupancy

2.1 Except as required by 6.A.3.4. of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III, and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the OBC, as remade from time to time.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the OBC as remade from time to time.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Classes I, II and III commodities as defined in NFPA 13 -1999 as amended.

3.5 Lighting levels of walkways and platforms shall conform to the OBC, as remade from time to time.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2) and 3.2.7.4.(1) respectively of the OBC as remade from time to time.

3.7 Guards and toe boards shall be installed in accordance with the OBC as remade from time to time.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs A 4.3 and A 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph A 2.1 or clause c) of paragraph 3.4. above, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 - 1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the OBC.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the OBC except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m^2 in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a “time-based egress analysis” undertaken and sealed by a Professional Engineer or Architect as defined in the OBC using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)

V_p = Vertical travel distance on the shelf and rack storage (m)

H_m = Horizontal travel distance on the main floor (m)

N_{lg} = Number of lift gates in the means of egress

N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the OBC shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the OBC main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching ‘at-level’ conveyor cross-overs shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 6. A. above; or

(b) the occurrence of any of the events described in Sections 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1 of this Authorization; or,

(iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section 6 A 1.1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 6. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

at Toronto this 31st day of July 2003.

BUILDING MATERIALS EVALUATION COMMISSION

BUILDING MATERIALS EVALUATION COMMISSION
AUTHORIZATION REPORT

DATE OF AUTHORIZATION **APRIL 24, 2003**
BMEC AUTHORIZATION **BMEC # 03-03-282**
BMEC APPLICATION **#A2003-05**

PIPE SHIELD
Non-destructive Pipe Rehabilitation Process

1. Applicant

Bradley Mechanical Services
1105 Britannia Road East
Mississauga, Ontario
L4W 3X1

Tel: (905) 670-7481
Fax: (905) 670-7483

2. Manufacturing Facilities

Bradley Mechanical Services
1105 Britannia Road East
Mississauga, Ontario
L4W 3X1

3. Description

The Bradley Mechanical Services Pipe Shield Non-destructive Pipe Rehabilitation Process (The "Pipe Shield Process) is intended for the rehabilitation of metallic potable water pipes. The Pipe Shield Process repairs pipes one-half inch (½") in diameter to four inches (4") in diameter. The Pipe Shield Process, using existing access points along the water line riser, cleans the pipes with air pressure and a garnet abrasive grit. After removing the abrasive grit from the cleaned pipes, air pressure is used to test the lines for leaks and a video bora scope is employed to visually examine the cleaned surfaces. Air pressure is again utilized to apply the AquataPoxy™ A-61 and /or Pipe Shield AN500™, a non-toxic, two-component epoxy. Upon completion, the performance level of the restored pipe is not less than that which existed prior to the Pipe Shield Process.

4. Authorization requested

The applicant sought a Building Materials Evaluation Commission (BMEC) authorization for the Pipe Shield Process as an alternative to repairing metal water pipes in existing buildings, as required by Article 7.1.2.2. "Alteration or Repair", and Section 7.2. "Materials and Equipment" of Ontario Regulation 403/97 (the "Ontario Building Code"), as amended or remade from time to time.

5. Assessment

Reports and assessments provided by the applicant show that if the Pipe Shield Process is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the Ontario Building Code will be provided.

Reports submitted, and reviewed:

1. Pipe Shield “Pipe Shield Technology Description and Installations Procedures”, February 20, 2003.

2. Pipe Shield “Equipment Schedule For Small Commercial Applications”, November 28, 2002.

3. Raven Lining System “AquataPoxy™ A-61" copyright 2002.

4. Material Safety data Sheet for AquataPoxy™ A-61.

5. NSF International Certification correspondence, February 20, 2003.

6. Pipe Shield “Outline of the Pipe Shield Training Program”, February 18, 2003.

7. Pipe Shield “Usage and Limitations”, February 19, 2003.

8. Pipe Shield “Epoxy Lining Production Report Form”

9. Pipe Shield Non Removable Warning Labels.

10. Pipe Shield and Bradley Mechanical Services Warranty Certificate.

11. Pipe Shield ”Employee Safety Handbook”

12. Bradley Mechanical Services LTD “Quality Management Manual”

13. Bradley Mechanical Services LTD (BMS) “Quality Management System: Forms/List.”

14. EnvirSense “Fact Sheet from the Navy Pollution Prevention Conference on the Restoration of Drinking Water Piping with Nontoxic Epoxy Linings”, June 6, 1995.

15. NSF International: Internet Data Sheets Providing Information with Respect to the Organization, Accreditations, Services, Water Distribution Systems, Certification Process, Products and Service Listings.

16. Manufacturer Information “Pipe Shield.”

6. Authorization

Use of the Pipe Shield Process is authorized as an alternative to traditional metal water pipe repair and/or replacement, subject to the following:

A. Specific Terms & Conditions

1. This authorization is valid only for Bradley Mechanical Services.

2. Only manufacturer trained and approved installation personnel shall perform the Pipe Shield Process in accordance with the Pipe Shield Installation, Training & Quality Assurance Manual.

3. The manufacturer shall provide field training to all installers and such training will be delivered by an experienced technician approved by Bradley Mechanical Services.

4. The Pipe Shield Process shall only be used on pipe of one-half inch (½") in diameter to four inches (4") in diameter and in single pipe segments up to one thousand feet (1000 ft) in length.

5. The Pipe Shield Process shall not be used in fire protection systems, such as standpipe and sprinkler systems.

6. The AquataPoxy™ A-61 and /or Pipe Shield AN500™, non-toxic, two-component epoxy shall be certified to the ANSI/NSF-61-2002 standard.

7. The thickness of the epoxy coating shall be determined by the epoxy manufacturer process instructions. The reduction in pipe diameter from the coating should be considered minimal and not essential for the flows in the pipes.

8. The curing process shall be supervised at all times by Bradley Mechanical Services personnel in accordance with the “Pipe Shield Technology Description and Installation Procedures.”

7. All materials and including the two-component epoxy equipment used in the Pipe Shield Process shall be supplied by Bradley Mechanical Services and shall be handled in accordance with the manufacturer’s specifications.

8. Trained and authorized Bradley Mechanical Services personnel in accordance with the Pipe Shield Instruction Manual shall, upon completion of the work or segment of the work, perform a visual inspection using a video bora scope to ensure the continuity and integrity of the applied lining.

9. The Pipe Shield Process shall include a warranty certificate that includes "The Pipe Shield Epoxy Lining Production Report."

10. Non-removable stickers or labels recording the following information shall be applied near the water shut off valve on each riser treated;

    (a) a name and telephone label - identifying Bradley Mechanical Services as having treated the pipe and including the phone number to call for information,

    (b) a warning - that the pipe has been coated with an epoxy lining, and

    (c) warning - not to torch, not to solder and to use pressure fittings only.

B. General Conditions

1. The use of the Pipe Shield Process as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

    (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

    (a) any change has been made to:

        (I) the material, system or building design that is the subject matter of this Authorization;
        (ii) the address of the applicant specified in Part 1 of this Authorization; or,
        (iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(I) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

at Toronto this 24th day of April 2003.

Trimroc™ Interior Mouldings

1. Applicant

Canamould Extrusion Inc.
101A Roytec Road
Woodbridge, Ontario
L4L 849

Tel: (905) 264-4436
Fax: (905) 264-4437

2. Manufacturing Facilities

Canamould Extrusion Inc.
101A Roytec Road
Woodbridge, Ontario
L4L 849

3. Description

The Trimroc™ Interior Mouldings are constructed from a Type 2 expanded polystyrene substrate, a 3 mm thick cementitious base coat, a glass fibre reinforcing mesh, and a 1 mm thick gypsum top coat. Trimroc™Interior Mouldings are fully adhered in place with drywall compound to an interior noncombustible substrate. The Trimroc™ Interior Mouldings are used for interior decorative wall and ceiling trim-work.

4. Authorization Requested

The applicant sought Authorization for the use of their product Trimroc™ Interior Mouldings, as an equivalent to combustible millwork as it is permitted in Article 3.1.5.7. of the 1997 Ontario Building Code as amended, for use in buildings required to be constructed of noncombustible construction.

5. Assessment

Reports, assessments and information provided by the applicant indicate that if the Trimroc™ Interior Mouldings are designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and with the specific terms and conditions stated in this Authorization, that the level of performance required by the 1997 Ontario Building Code as amended will be provided.
Reports, assessments and information reviewed:

1. Technical Background Information Memo relating to the Trimroc™ Interior Mouldings: Canamould Extrusion Inc., dated July 18, 2002.

2. ASTM E84, Standard Test Method for Surface Burning Characteristics of Building Materials.

3. ASTM E84, test results from Underwriters' Laboratories of Canada, Standard Test Method for Surface Burning Characteristics of Building Materials, Job No. 02NK17800, dated September 10, 2002.

4. UL 1715, Fire Test of Interior Finishes Material.

5. UL 1715, test results from Underwriters' Laboratories of Canada, Fire Test of Interior Finishes Material, Application No. 02NK27412, dated September 10, 2002.

6. BOCA Commentary: Reference 2603.9.

7. Video Tape: UL 1715 “Canamould Extrusion Inc.” dated, July 10, 2002.

8. Trimroc™ Interior Mouldings "Installation Guide", copyright 2001, CGC Inc.

9. Canamould Extrustions Inc. "Quality Control Manual for Trimroc™ Interior Products"

6. Authorizations

The Canamould Extrusion Inc.: Trimroc™ Interior Mouldings are authorized for use as a combustible millwork in buildings constructed of noncombustible construction wherever combustible millwork as described in Article 3.1.5.7. of the 1997 Ontario Building Code as amended would be permitted to be installed.

A. Specific Terms and Conditions

1. This Authorization is valid only for Canamould Extrusion Inc.: Trimroc™ Interior Moulding (Trimroc™).

2. The Trimroc™ mouldings shall be marked "Trimroc FR" in large print and at regular interval on the back of the moulding.

3. The Trimroc™ mouldings shall be permitted for interior use in buildings required to be constructed of noncombustible construction as referenced in Part 3 of the 1997 Ontario Building Code as amended.

4. The use of Trimroc™ mouldings shall be limited to the maximum dimensions of 150 mm (6") crown mouldings at ceilings, 100 mm (4") chair rails, 100 mm (4") baseboards, 120 mm (4-3/4") door casings, and 660 mm (26") diameter ceiling centres.

5. Drywall compound shall be applied at inside corners, outside corners and butt joints between adjacent lengths of mouldings to maintain the continuity of the protective covering.

6. The Trimroc™ mouldings shall not constitute more than 10% of the aggregate area of the wall and ceiling areas of a room or space in which they are installed. This area includes the area of doors and other openings in the walls. The Trimroc™ shall be uniformly distributed throughout the room or space.

7. The Trimroc™ mouldings shall be fully adhered, to an acceptable substrate material as referenced in 6. A. 9. of this Authorization, with a continuous coat of drywall compound that is applied directly to the full width of the bonding surface of the Trimroc™ moulding.

8. The Trimroc™ mouldings shall be installed in accordance with Canamould Extrusion Inc. "Installation Guide."

9. The Trimroc™ mouldings shall be applied to one of the following substrates: gypsum board, plaster, concrete, masonry or cement board.

6. B. General Conditions

1. The use of Canamould Extrusion Inc. Trimroc™ Interior Mouldings as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

at Toronto this 30th day of January 2003.

POTTER ELECTRIC SIGNAL COMPANY.
HydraTank N_2 System

1. Applicant

Potter Electric Signal Company
2081 Craig Road
St. Louis, Missouri
63146
USA

Tel: (314) 878-4321
Fax: (314) 878-7264

2. Manufacturing Facilities

Potter Electric Signal Company
2081 Craig Road
St. Louis, Missouri
63146
USA

3. Description

The Potter Electric Signal Co. HydraTank N_2 System is a self contained water supply system for use in a fire sprinkler system designed in accordance with NFPA 13D 2002 "Standard for Installation of Sprinkler Systems for One and Two Family Dwellings." The Potter Electric Signal Co. HydraTank N_2 System may be used where there is no reliable water supply, or the water supply is inadequate to meet the demand of the sprinkler system.

The Potter Electric Signal Co. HydraTank N_2 System consists of one or more filament wound composite water tanks, to store the water necessary to meet the demands of the sprinkler system; one or more nitrogen cylinders, to supply the pressure required to discharge the water into the system; a locked cabinet to securely store the nitrogen cylinders; UL listed pressure regulators, to maintain the systems's operating pressure; and a status and trouble alarm panel to supervise and indicate: water levels, nitrogen pressure, the battery condition, and AC power.

4. Authorization Requested

The applicant sought authorization for the use of a non-metallic filament wound composite water tank, tested and approved as per ASNI/NSF 44 "Residential Cation Exchange Water Softener" for use in the Potter Electric Signal Co. HydraTank N_2 System as it is described in Part 3 "Description" of this Authorization, as an acceptable material (i.e. water supply source) permitted to be used in accordance with Sentence 3.2.5.13.(3) of the 1997 Ontario Building Code as amended.

5. Assessment

Reports and assessments provided by the applicant show that if the non-metallic filament wound composite water tank forming a part of the Potter Electric Signal Co. HydraTank N_2 System, is designed, performance tested and installed in accordance with the manufacturer's instruction and limitations and in conformance with the specific terms and conditions stated in this authorization, the level of performance required by the 1997 Ontario Building Code as amended will be provided.

Reports, assessments and information reviewed:

1. Technical Background Information Memo relating to the Potter Electric Signal Co. HydraTank, BMEC A2002-12, dated September 24, 2002.

2. HydraTank Parts list.

3. ISO 9002: 1994 Certificate, dated August 12, 2001.

4. Certificate of Compliance, No. 201559 (107788) CSA Certificate for Power Supplies, dated November 9, 1999.

5. UL ZJCZ7.E11368 "Flexible Cord Certified for Canada", dated June 11, 2002.

6. UL ZJCZ7.Guide Info "Flexible Cord Certified for Canada", dated June 11, 2002.

7. UL NKPZ7.Guide Info "Float-And Pressure Operated Certified For Canada", dated June 6, 2002.

8. NKPZ8.E42816 "Motor Controllers Float and Pressure-Operated Certified For Canada - Component", dated June 11, 2002.

9. ZDUZ2.E52496 "Water Softeners and Demineralizes - Components" dated June 11, 2002.

10. ANSI/NSF Standard 044 "Residential Cation Exchange Water Softeners", dated March 30, 2001.

11. Potter Electric Signal Co. Technical Assembly Drawings No. 1119390-30-B, 1119380-30-C, 1119340-4-A, 1119330-30-C, 1119280-30-C, 11192261-04-D, 1119261-05-D, 1119240-30-E, 1119250-30-A, 1119215-30-B, AND 216-30-A.

28. Potter Electric Signal Co. HydraTank manufacturer's information, Document #S119210, "Assembly Procedures."

6. Authorization

The Potter Electric Signal Co. HydraTank N_2 System is authorized for use in a fire suppression system as a water storage system that satisfies the water storage supply requirements of NFPA 13D "Standard for Installation of Sprinkler Systems for One and Two Family Dwellings" which is incorporated by reference Sentence 3.2.5.13.(3) of the 1997 Ontario Building Code as amended, by incorporating the use of a non-metallic filament wound composite water tank in the design of the Potter Electric Signal Co. HydraTank N_2 System. The non-metallic filament wound composite water tank used in the design Potter Electric Signal Co. HydraTank N_2 System is authorized subject to the following terms and conditions:

A. Specific Terms and Conditions:

1. This authorization is valid only for Potter Electric Signal Co. HydraTank N_2 System.

2. Notwithstanding the requirements of sections 5.1.3. and 6.2.3. of NFPA 13D, the design of the Potter Electric Signal Co. HydraTank N_2 System shall be in conformance with NFPA 13D, 2002 "Standard for Installation of Sprinkler Systems for One and Two Family Dwellings."

3. The design and general review of the Potter Electric Signal Co. HydraTank N_2 System shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act,* (Ontario); the Professional Engineer shall provide the chief building official with a document certifying that the installation conforms with this authorization.

4. The composite fibreglass water storage tank shall be tested and approved in accordance with ANSI/NSF 44 "Residential Cation Exchange Water Softeners."

5. The tank(s) shall be marked in a conspicuous location indicating the review and evaluation by ANSI/NSF.

6. The water storage tanks used in Potter Electric Signal Co. HydraTank N_2 System shall have the following properties; the tanks shall be:

   (a) made of a wound fibreglass reinforced epoxy laminate,

   (b) rated for a minimum pressure of 1235 Kpa (150 psi) at a temperature of 48.8 °C (120 °F),

   (c) capable of offering a supply range between 100 gal. (378.5 L) to 464 gal. (1756 L) capacity, and

   (d) made of moulded thermoset plastic or fibreglass at the base.

7. The water tank liner used in Potter Electric Signal Co. HydraTank N_2 System shall have the following properties; the tank liner shall be:

   (a) seamless,

   (b) free from fibrous materials, and

   (c) resistance to regenerating chemicals.

8. The Potter Electric Signal Co. HydraTank N_2 System shall be designed and installed in accordance with the requirements the "Installation, Operation and Instructional Manual", (Manual #5403529-Rev P, dated 5-02) for the Potter Electric Signal Co. HydraTank N_2 System.

9. When the HydraTank N_2 System is installed in a building, the system:

   (a) shall be located in building that is fully sprinklered, or

   (b) when located in a building that is partially sprinklered shall be:

      (i) located in a room separated from the remainder of the building, and

      (ii) the room shall be sprinklered.

6. B. General Conditions

1. The use of Potter Electric Signal Co.'s HydraTank N_2 System as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      ii. provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

at Toronto this 30th day of January 2003.

Rashmi Nathwani, Chair

BUILDING MATERIALS EVALUATION COMMISSION (BMEC)

DATE OF AUTHORIZATION **DECEMBER 5, 2002**
BMEC AUTHORIZATION **BMEC # 02-08-279**
BMEC APPLICATION **#A2002-03**

HPB™
(High Performance Bedding)

1. Applicant

Dufferin Aggregates.
3300 Hwy #7, Suite 400
Concord, Ontario
L4K 4M3

Tel: (905) 761-7500
Fax: (905) 761-5905

2. Manufacturing Facilities

Milton Quarry
9410 Dublin Line, PO Box 68
Milton, Ontario
L9T 2Y3

Aberfoyle Quarry Pit
RR #3 Country Road #46
Guelph, Ontario
N1H 6H9

3. Description

The Dufferin Aggregates HPB™: High Performance Bedding (HPB™) is a limestone aggregate and gravel offering a 9.5 mm top size. The HPB™ is a crushed, washed, and graded aggregate; and is manufactured at the Milton Quarry and the Aberfoyle Quarry Pit.

4. Authorization requested

The applicant sought Authorization for the use of the HPB™ as an acceptable alternative that satisfies the granular material requirements for applications beneath floors, and on the top and sides of drain pipes and tile as it is required by the provisions of the 1997 Ontario Building Code as amended.

The applicant requested an equivalent to the requirement of the Sentences 9.14.2.1.(2) , 9.14.3.3.(4) and 9.16.2.1.(1) of the 1997 Ontario Building Code as amended.

5. Assessment

Reports and assessments provided by the applicant demonstrate that if the HPB™ is manufactured, stored, installed, maintained and monitored in accordance with the limitations of the manufacturer's specifications and the conditions stated in this Authorization, a level of performance equivalent to that required by the Sentences 9.14.2.1.(2), 9.14.3.3.(4) and 9.16.2.1.(1) of the 1997 Ontario Building Code as amended will be provided.

Reports submitted and reviewed:

1. Manufacturer's literature "You've got the look."

2. Manufacturer's literature "Our Environment is Counting On You."

3. 5 x 7 colour photo of HPB™ with mechanical systems.

3. Ontario Association of Certified Engineering Technicians and Technologist Outstanding Technical Achievement Certificate, dated May 8, 1996.

4. Letter of recommendation, Unilock, dated May 16, 2002.

5. Letter of recommendation, Mid-North Excavating, dated June 11, 2002.

6. Letter of recommendation, Maxwell Excavating Limited, dated July 23, 2001.

7. Letter of recommendation, Marshall, Macklin, Manahan, Consulting Engineers, Surveyors, Planners, dated November 29, 1994.

8. Letter of Approval, City of Mississauga, Department of Transportation and Works, dated August 17, 1994.

9. Letter of Approval, Regional Municipality of Peel, Public Works, dated August 24, 1994.

10. Letter of recommendation, Bert Contracting, dated October 18, 2000.

11. Technical Background Information Memo (TBI) relating to H.P.B.™ (High Performance Bedding), dated March 26, 2002.

12. Peto MacCallum Ltd.: Consulting Engineers, "Comparative Evaluation of Pipe Bedding Stones for Acceptance by the City of Mississauga", dated April 1998, Ref # per copy 8TE088.

13. Manufacturer Literature: HPB™: High Performance Bedding.

14. User Guide for Dufferin Aggregates: Quaility System Manual, ISO 9002:94, Guide 25, dated February 28, 2002.

6. Authorization

The Dufferin Aggregates HPB™: High Performance Bedding (HPB™) is authorized for use as a granular material as referenced in Sentences 9.14.2.1.(2) 9.14.3.3.(4) and 9.16.2.1.(1) of the 1997 Ontario Building Code as amended, when the HPB™ is manufactured, stored, installed, maintained and monitored in accordance with the limitations of the manufacturer's specifications and recommendations; and the following terms and conditions:

A. Specific Terms and Conditions

1. This authorization is valid only for Dufferin Aggregates HPB™: High Performance Bedding (HPB™) manufactured at the facilities referenced in Part 2. of this Authorization.

2. The HPB™ shall be manufactured and stored as per Dufferin Aggregates Quality Control Manuals, dated February 28, 2002.

3. When the HPB™ is used on the top and sides of drain tile or pipes, a geo-textile material shall be installed as per Sentence 9.14.3.3.(3) of the 1997 Ontario Building Code as amended.

4. A signed copy of the quarry ticket, for each shipment received shall be kept with the on-site construction documents, and upon request produced to the Authority Having Jurisdiction; and the Dufferin Aggregates quarry ticket should indicate the following minimum information:

   (a) Name of the Quarry,
   (b) Date,
   (c) Ticket number,
   (d) Gross and net amount of the HPB™ product, and
   (e) Name of the product.

5. The HPB™ is not authorized for applications pertaining to Part 8 “Sewage Systems” of the 1997 Ontario Building Code as amended.

6. The HPB™ is not authorized for use when designed, or installed in combination with other aggregates.

B. General Conditions

1. The use of the Dufferin Aggregates HPB™ (High Performance Bedding) as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      ii. provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

at Toronto this 5th day of December 2002.

BUILDING MATERIALS EVALUATION COMMISSION (BMEC) AUTHORIZATION REPORT

DATE OF AUTHORIZATION	**OCTOBER 31, 2002**
BMEC AUTHORIZATION	**BMEC # 02-07-278**
BMEC APPLICATION	**# A2002-13**

The Waterless No Flush™ Urinal

1. Applicant

Matrix Environmental Partners Inc.
3-331 Trowers Road
Woodbridge, Ontario
L4L 6A2

(905) 850-8080
(905) 850-9100

2. Manufacturing Facilities

Fibreall Industries
92 North Port Road
Port Perry, Ontario
L9L 1B2

3. Description

Matrix Environmental's Waterless No Flush™ Urinal (The "Waterless Urinal") is a plumbing fixture designed to be used in a washroom lieu of a conventional urinal.

The Waterless Urinal is comprised of 5 parts: 1. Urinal Body: the urinal body is gel-coated using a polymer gel-coat, the body is re-enforced with a chopped strand fibreglass mat. Waterless Co. Model numbers 2003, 2003B, 2004 and 2004B: Kalahari and Sonora. 2. The Trap: the removable trap is made of low density polyethylene with white concentrate and fits into the urinal body to accept the urine. Waterless Co. part number 3001: EcoTrap®. 3. The Trap Retainer: the trap retainer is a 4"x 2" ABS reduced coupling, the removable trap fits into the trap retainer. Canplas model number 3025. 4. The Elbow Outlet: the elbow outlet is a 2" ABS 90^0 elbow, that fits into the trap retainer and allows the urine to flow to the drain. Canplas model number 2452. 5. The Trap Seal: the trap seal is a specifically formalized trap seal liquid with a specific gravity lower than urine, approximately 0.9 litres of this liquid is used in the trap. The trade name for this liquid is Blueseal®, Waterless part number 1114.

4. Authorization Requested

The applicant sought authorization for the use of their product as a waterless urinal in buildings of all types of construction wherever conventional urinals, as described in Article 7.6.4.2. of the 1997 Ontario Building Code (OBC), would be permitted to be installed under the of the OBC.

5. Assessment

Reports and assessments provided by the applicant show that if the Matrix Environmental Waterless No Flush™ Urinal is designed, performance tested and maintained in accordance with the manufacturer's limitations and instructions stated in this authorization, the level of performance required by the OBC for conventional urinals will be provided:

Reports submitted and reviewed:

1. Technical Background Information Memo (TBI) relating to the The Waterless No Flush™ Urinal, dated September 23, 2002.

2. Reference Drawing, "The Waterless No Flush™ Urinal."

3. Reference Drawing, "EcoTrap®."

4. Water Matrix Inc. Specifications No Flush™ Urinal, Sonora™ Model#2004, dated June 2002.

6. Authorization

The Waterless No Flush™ Urinal is authorized for use as a urinal in all locations, in buildings of all types of construction wherever a conventional urinal, as described in Article 7.6.4.2. of the OBC, would be permitted to be installed.

A. Specific Terms and Conditions

1. This authorization is valid only for Matrix Environmental Partners Inc.: The Waterless No Flush™ Urinal.

2. A copy of the maintenance instructions for the Blueseal® Refill and the Ecotrap® Exchange shall be submitted along with this BMEC Authorization when applying for a building permit.

3. A permanent sign in a conspicuous location indicating the maintenance schedules, as they are referenced in 6.A.2. of this Authorization, shall be posted in each room that a Waterless Urinal is installed.

4. The Waterless No Flush™ Urinal must be marked indicating that it conforms to ANSI.Z124.

5. The Waterless No Flush™ Urinal shall be installed in accordance with the manufacturer's instructions.

6. The manufacturer shall provide training of the proper use, operation and maintenance of the device.

7. The plumbing system that the Waterless No Flush™ Urinal forms a part of shall be designed as per section 7.5. "Venting" of the OBC.

8. The Waterless No Flush™ Urinal shall be connected to a drain waste pipe that is designed as per Subsections 7.4.9. and 7.4.10. of the OBC.

9. The Waterless No Flush™ Urinal is considered to have satisfied the requirements of Subsection 7.2.3. of the OBC when:

   (a) installed with an EcoTrap® as described Part 3 of this Authorization, and

   (b) used in conjunction with the manufacturer's trap seal liquid, as it is specified in 6.A.11. of this authorization,

10. Double trapping of the Waterless No Flush™ Urinal is not permitted.

11. The Waterless No Flush™ Urinal shall be used in conjunction with the manufacturer's Blueseal®, or other similar liquids approved by the manufacturer.

12. The Waterless No Flush™ Urinal shall conform to the flame spread and smoke development requirements of the OBC.

B. General Conditions

1. The use of The Waterless No Flush™ Urinal as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

at Toronto this 31st day of October 2002.

BUILDING MATERIALS EVALUATION COMMISSION

Rashmi Nathwani, Chair

BUILDING MATERIALS EVALUATION COMMISSION (BMEC)

DATE OF AUTHORIZATION **OCTOBER 31, 2002**
BMEC AUTHORIZATION **BMEC # 02-06-277**
BMEC APPLICATION **#A2002-11**

Royal PVC DWV Starter Fittings

1. Applicant

Royal Pipe Systems
131 Regalcrest Court
Woodbridge, Ontario
Canada
L4L 8P3

Tel: (905) 856-7550
Fax: (905) 856-4367

2. Manufacturing Facilities

Royal Pipe Systems
56400 Mound Road
Shelby, Twp
MI, USA
48316

3. Description

The Royal PVC DWV Starter Fitting consists of a one piece, molded drain waste vent (DWV) for connecting three drains to one pipe, through a single fitting. The Royal PVC DWV Starter Fitting is designed for use in stack drainage applications where multiple fittings are required to connect a series of plumbing fixtures. The starter fitting consists of a 3" (75 mm) wye toilet drain connection and incorporates two 1 ½" (38 mm) shower/bath outlets at 45º from the centre of the fitting.

The Royal PVC DWV Starter Fitting is designed to reduce the connection of multiple fittings to connect different fixtures required on stack assemblies within limited spaces.

4. Authorization requested

The applicant sought authorization for the use of the Royal PVC DWV Starter Fitting as part of a drainage system to replace multiple fittings in a stack DWV system referred to in Articles 7.2.4.5. and 7.2.4.1. of the 1997 Ontario Building Code as amended.

5. Assessment

Reports and assessments provided by the applicant demonstrate that if the Royal PVC DWV Starter Fitting is constructed, installed, operated, maintained and monitored in accordance with the limitations of the manufacturer's specifications and the conditions stated in this authorization, a level of performance equivalent to that required by the 1997 Ontario Building Code as amended will be provided.

Reports assessments, information submitted, and reviewed:

1. Technical Background Information Memo relating to Royal PVC DWV Starter Fitting, dated September 23, 2002.

2. CSA Certificate of Compliance for Royal Pipe Systems “PVC DWV Starter Fitting”, issued June 27, 2002.

3. Shop Drawings, Reference Job #6505 “Two Cavity 3" Manifold PVC”, dated October 10, 2002.

4. ASTM International: Designation F610/F610M-00a “Standard Test Method for Evaluating the Quality of Molded Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings by Heat Reversion Technique.

5. ASTM International: Designation D2122-98 “Standard Test Method for Determining Dimensions of Thermoplastic Pipe and Fittings”

6. Royal Pipe Systems PVC DWV Starter Fitting “Quality Control Procedure”, dated August 14, 2002.

7. Installation Manual “Royal Pipe Systems PVC DWV Starter Fitting.”

8. Manufacturer’s Literature, ”Show and Tell: The Next Generation of Fire Protection Royal Pipe Systems.”

9. Letter Report ULC, re: PVC Fittings Designated as “PVC DWV Starter Fitting,” dated October 24, 2002.

6. Authorization

The Royal PVC DWV Starter Fitting is authorized for use in a drainage system for a multi storey building using a modified stack configuration as referenced in Articles 7.2.4.5. and 7.2.4.1. of the 1997 Ontario Building Code as amended, all other requirements pertaining to the installation of the Royal PVC DWV Starter Fitting shall conform to the requirements of the 1997 Ontario Building Code as amended, and is subject to the following terms and conditions:

A. Specific Terms and Conditions

1. This authorization is valid only for Royal PVC DWV Starter Fitting.

2. The Royal PVC DWV Starter Fitting shall be a moulded assembled unit and shall not be site assembled.

3. The Royal PVC DWV Starter Fitting is permitted in a single configuration as a specially designed device or system.

4. The Royal PVC DWV Starter Fitting shall meet the smoke and flame spread requirements of the 1997 Ontario Building Code as amended.

5. The Royal PVC DWV Starter Fitting shall not be installed within a supply or return air plenum.

6. The Royal PVC DWV Starter Fitting must be provided with a clean-out above the flood level rim of the highest fixture it serves.

7. The Royal PVC DWV Starter Fitting shall be installed as per CSA B181.2, "PVC Drain, Waste, and Vent Pipe and Pipe Fittings."

8. The Royal PVC DWV Starter Fitting shall be marked, and certified to CSA B181.2, "PVC Drain, Waste, and Vent Pipe and Pipe Fittings" as a molded assembled unit.

B. General Conditions

1. The use of the Royal PVC DWV Starter Fitting must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the Specific Terms and Conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Specific Terms and Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this authorization;

      (ii) the address of the applicant specified in Part 1 of this authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the applicant, or the material, system or building design that is the subject matter of this authorization, has failed to comply with any of the Specific Terms and Conditions set out in this Authorization; or

   (d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

at Toronto this 31st day of October 2002.

BUILDING MATERIALS EVALUATION COMMISSION (BMEC) AUTHORIZATION REPORT

DATE OF AUTHORIZATION **OCTOBER 31, 2002**
BMEC AUTHORIZATION **BMEC # 02-05-276**
BMEC APPLICATION **# A2002-09**

Plenum-Gard®, Riser-Gard® and Resi-Gard® Raceways

1. Applicant

Carlon, Lamson & Sessions Inc.
25701 Science Park Drive

Cleveland, Ohio
USA
44122

Tel: (216) 766-6645

Fax: (216) 831-0438

2. Manufacturing Facilities

Lamson & Sessions
4395 Pasadena Fwy and Tenneco Rd
PO Box 5664, Pasadena, TX
USA
77508

Pyramid Industries, Lamson & Sessions
1422 Irwin Drive
PO Box 8439, Erie, PA
USA
16505

3. Description

Carlon, Lamson & Sessions Inc.™ Plenum-Gard®, Riser-Gard®, Resi-Gard raceways are used in the voluntary protection and management of fibre optics and communication cables. The raceways are flexible, pliable, nonmetallic and marked in conformance with ULC/ORD-C2024-02.

4. Authorization Requested

The applicant sought authorization for the use of their product as a cable management system in all locations, in buildings of all types of construction where cables would be permitted to be installed under the Ontario Electrical Safety Code, 23rd Edition 2002 without conduit protection. These raceways are intended to better organize cables in all spaces in buildings to facilitate the removal of cables.

5. Assessment

Reports and assessments provided by the applicant show that if the Plenum-Gard®, Riser-Gard®, Resi-Gard™Raceways are designed, performance tested and maintained in accordance with the limitations of the manufacturer's instructions; and they meet the level of performance required by the Ontario Building Code in locations where electrical wires and cables are required to meet FT-6, FT-4, and FT-1 ratings.

Reports submitted and reviewed:

1. Technical Background Information Memo relating to the Carlon, Lamson & Sessions Inc. Plenum-Gard®, Riser-Gard® and Resi-Gard™ Raceways, Dated July 18, 2002.

2. Manufacturer's Literature: "Carlon® Flexible Raceway Systems" (Plenum-Gard® and Riser-Gard®).

3. Manufacturer's Literature: "Carlon® Structured Cable Management Systems" (Resi-Gard®).

4. ULC/ORD-C2024-02 " Standard Method of Fire Tests for Optical Fibre Cable Raceways."

5. Installation Manual for Resi-Guard®:Carlon® Structured Cable Management Systems Handbook.

6. Lamson & Sessions Pasadena, Ca. Plant Quality Manual, revised September 2002

7. Pyramid Industries Quality Manual ISO 9002, revised September 2002

8. Certification: Underwriter Laboratories Inc, File E-151168, Project 02ME10205, dated May 28, 2002, Filing Category "Optical Fibre/Communication Cable Raceways (QAZM)."

9. Interpretation letter from ULc dated, September 18, 2002.

6. Authorization

The Plenum-Gard®, Riser-Gard®, Resi-Gard™raceways ("the raceways") are authorized for use as a cable management system in all locations, in buildings of all types of construction where cables would be permitted to be installed under the Ontario Electrical Safety Code, 23rd Edition 2002 without conduit protection.

A. Specific Terms and Conditions

1. This authorization is valid only for flexible nonmetallic raceways and associated fittings manufactured by Carlon, Lamson & Sessions Inc. and identified as follows:

    (a) Plenum-Gard® raceway and fittings for optical fibre and communications cables marked OFCR-FT-6,

    (b) Riser-Gard® raceway and fittings for optical fibre and communications cables marked OFCR-FT-4, and

    (c) Resi-Gard™raceway and fittings for optical fibre and communications cables marked OFCR-FT-1

2. The raceways and fittings shall be:

    (a) Tested and certified in conformance with ULC/ORD-C2024-02 "Standard Method of Fire Tests for Optical Fibre Cable Raceway", and

    (b) Marked in conformance with ULC/ORD-C2024-02 as follows:

        (i) Raceways complying with FT-6 requirements shall be marked with "Plenum-OFCR FT-6",

        (ii) Raceways complying with FT-4 requirements shall be marked with "Riser-OFCR FT-4", and

        (iii) Raceways complying with FT-1 requirements shall be marked with "General-OFCR FT-1".

3. In addition to the other conditions listed herein, the raceways may be used only in the following locations:

    (a) Plenum-Gard® may be used in all locations in buildings, including concealed spaces used as plenums, where an FT-6, FT-4 or FT-1 rating for cables or raceways is required,

    (b) Riser-Gard® may be used in all locations in buildings where an FT-4 or FT-1 rating for cables or raceways is required, and

    (c) Resi-Gard™may be used in all locations in buildings where an FT-1 rating for cables or raceways is required.

4. The raceways shall be used to contain only cables conforming to Section 56 (Optical Fiber Cables) and Section 60 (Electrical Communications Cables) in CSA C22.1-02 – Ontario Electrical Safety Code, 23rd Ed, 2002, Part 1.

5. The raceways shall be used to contain cables only where a raceway or conduit is not required for protection of cables by CSA C22.1-02 – Ontario Electrical Safety Code, 23rd Ed, 2002, Part 1.

6. The raceways shall not be used to contain cables for fire alarm and voice communications systems as described in Subsection 3.2.4 of the Ontario Building Code as amended.

7. The raceways shall comply with Sentence 3.1.9.2.(1) and 3.1.9.3.(2) of the Ontario Building Code as amended when they penetrate fire separations.

B. General Conditions

1. The use of Carlon, Lamson & Sessions Inc. raceways as described in 6. A. Specific Terms and Conditions No. 1. must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

ii. provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Dated at Toronto this 31st day of October 2002.

BIODIFFUSER™
Bio 2 and Bio 3 Chamber Systems

1. Applicant

PSA, Inc
P.O Box 3000
Hillard, Ohio
USA
43026

Tel: (614) 658-0254
Fax: (614) 658-0204

2. Manufacturing Facilities

Carson Industries, Inc
1675 Industrial Drive
Napoleon, Ohio
USA
43545

3. Description

BioDiffuser™: Bio 2 and Bio 3 Chamber Systems ("BioDiffuser™ Chambers") are intended for use in a sewage system in lieu of absorption trenches constructed of stone and distribution pipe. The BioDiffuser™ Chambers are formed from injection moulded polyolefin and are connected end-to-end using a built-in latch. The Bio 2 model chambers have an actual bottom width of 381 mm and an actual height of 302.3 mm. The Bio 3 model chambers have an actual bottom width of 558 mm and an actual height of 302.3 mm. The side walls of both models are louvered and extend to a height of 239.4 mm, of which 57% is open. The BioDiffuser™ Chambers are closed at the ends of a trench with snap-on end plates.

4. Authorization Requested

The applicant sought authorization for use of the BioDiffuser™ Chambers as an alternative to the construction of stone and distribution pipe in as required by Section 8.7 of the Ontario Building Code. The applicant requested that the BioDiffuser™ Chambers be used to replace stone and distribution pipe in absorption trenches and filter beds that are:

i. gravity fed,

ii. “dosed” (non-pressurized distribution system) and,

iii. pressurized.

Note: For the purposes of this authorization, “dosed” means a system in which effluent is pumped to the leaching bed either by pump or siphon, but the effluent is not pressurized within the leaching bed.

5. Assessment

Reports and assessments provided by the applicant show that if the BioDiffuser™ Chambers are designed, performance tested, installed and maintained in accordance with the limitations in the manufacturer's instructions and the conditions stated in this authorization, a level of performance will be provided as required by the Ontario Building Code 1997, for absorption trenches in soil, in leaching bed fill or in a filter bed, whether gravity fed, pressurized or “dosed”.

Reports submitted and reviewed:

1. International Association of Plumbing and Mechanical Officials, “Materials and Property Standards for Plastic Leaching Chambers”, IAPMO PS 63-99a.

2. Certificate of Listing, IAPMO Research and Testing, Inc. dated June 2002.

3. ADS: Products Notes: Product Note 3.121A: Re: BioDiffuser™: Bio 2 and Bio 3 Chamber, Installation Guidelines, dated August 10, 2000.

4. BioDiffuser™: Bio 2 and Bio 3 Leaching Bed Chamber Drawings.

5. BioDiffuser™: Bio 2 and Bio 3 Leaching Bed Chamber Specifications Data Sheet.

6. Letter of approval from the Illinois Department of Public Health, dated March 5, 2001.

7. Letter of approval from the State of Maine: Department of Human Services, Division of Health Engineering, dated March 9, 2001.

8. Letter of approval from the State of New Hampshire: Department of Environmental Services, dated April 5, 2001.

9. Letter of approval from the Ohio Department of Health, dated September 21, 2000.

10. Letter of approval from the State of New York: Department of Health, dated January 8, 2001.

11. Letter of approval from the State of Washington: Department of Health, dated April 6, 2001.

12. Letter of approval from the Commonwealth of Kentucky: Cabinet for Health Services, Department for Public Health, dated February 19, 2001.

13. Letter of approval from the State of Oklahoma: Department of Environmental Quality, dated November 29, 2000.

14. Letter of approval from the Florida Department of Health, dated July 17, 2001.

15. Letter of approval from the State of Tennessee: Department of Environment and Conservation, dated October 9, 2001.

16. Letter of approval from the Commonwealth of Massachusetts: Department of Environmental Protection, dated March 3, 2001.

17. Technical Background Information Memo relating to the BioDiffuser™ Chambers, dated June 17, 2002.

6. Authorization

The use of the BioDiffuser™ Chambers is authorized in sewage systems within the scope of Part 8 of the 1997 Ontario Building Code, as an alternative to stone and distribution pipes in absorption trenches and in filter beds, when installed in accordance with the manufacturer's recommendations and the Specific Terms and Conditions of this Authorization.

A. Specific Terms and Conditions

1. This Authorization is valid only for BioDiffuser™: Bio 2 and Bio 3 Chamber Systems.

2. The BioDiffuser™shall be manufactured to AASHTO Standard H-10 loading.

3. When the BioDiffuser™ Chambers are installed in lieu of distribution piping and stone, the length of the chamber system must equal the required lengths of distribution pipe specified in Articles 8.7.3.1. and 8.7.5.3.

4. When the BioDiffuser™ Chambers are installed in lieu of distribution piping and stone, the leaching beds must satisfy the general construction requirements specified in Articles 8.7.2.1., 8.7.4.2. and 8.7.5.3.

* 5. Reserved

6. The minimum clearance distances required by Article 8.2.1.6. for distribution piping shall be met by the BioDiffuser™ Chamber Systems.

* 7. When installed in lieu of distribution piping and stone in absorption trenches, the trenches for the BioDiffuser™ Chambers shall be:

   (a) approximately the same length and not more than 30 m in length,

   (b) a minimum width of 500 mm,

   (c) at least 600 mm and not more than 900 mm in depth,

   (d) centred at least 1600 mm,

   (e) at least 900 mm at all points on the bottom of the trench, above the high ground water table, rock or soil with a percolation time greater than 50 minutes, and

   (f) backfilled, after installation of the BioDiffuser™ Chambers, with leaching bed fill, so as to ensure that after the leaching bed fill settles, the surface of the leaching bed will not form any depressions.

_____(g) backfilled with a soil that does not contain heavy clay, silt or debris, and is manually compacted along the sides of the chamber to provide lateral support.

8. When installed in lieu of distribution piping and stone in filter beds, the lines of BioDiffuser™ Chambers shall be evenly spaced over the surface of the filter medium to which the sewage effluent is applied, and the filter bed shall meet the following requirements:

   (a) the filter medium shall meet the requirements of Subsection 8.7.5. of the 1997 Ontario Building Code,

   (b) the surface of the filter bed shall be at least 900 mm above the high ground water table, rock or soil with a percolation time greater than 50 minutes per centimetre as per Clause 8.7.3.2.(1)(e) of 1997 Ontario Building Code.

9. When used in gravity fed conditions, the BioDiffuser™ Chambers shall be installed in compliance with all the above-stated Specific Terms and Conditions and be:

   (a) installed level over the length of the trench,

   (b) securely connected, chamber to chamber, using the built-in latch,

   (c) free of structural damage and used full length (not cut),

   (d) equipped with end caps installed on both ends, and

   (e) equipped with a built-in splash plate at the inlet end of each chamber line, to prevent soil scouring.

10. Where the sewage effluent is “dosed” to the leaching bed by pumps or a siphon, the BioDiffuser™ Chambers shall be installed to comply with all the above-stated Specific Terms and Conditions and:

   (a) the effluent is pumped to a header line or distribution box prior to entering the chambers, and,

   (b) a volume of effluent within the range of 3.5 - 8.0 litres per metre of BioDiffuser™ Chambers , must be pumped within a time period not exceeding 15 minutes, to meet the requirements of Sentence 8.6.1.3.(4).

11. Where the sewage effluent is distributed through a pressurized system, the BioDiffuser™ Chambers shall be installed:

(a) to comply with Specific Terms and Conditions numbers 1. through 9. above, and,

(b) with a minimum 1½ (38 mm) diameter pipe extending over the entire length of each trench, and such pipe:

i. being specified by the manufacturer as acceptable for pressurized installations,

ii. having minimum 6 mm diameter orifices, spaced over its length to ensure even distribution of effluent,

iii. being supported in a manner as to ensure self-draining and prevent freezing of its contents,

iv. having clean-outs installed at the downstream end of each chamber line, to allow the system to be serviced, and,

v. receiving effluent from a treatment unit equipped with an effluent filter on the outlet, such effluent filter to be installed and sized in accordance with the manufacturer's recommendations.

B. General Conditions

1. The use of the BioDiffuser™ Chamber Systems must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

(b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      i. the material, system or building design that is the subject matter of this Authorization;

      ii. the address of the applicant specified in Part 1 of this Authorization; or,

      iii. the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      i. does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      ii. provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Dated at Toronto this 29th day of January 2004.

3. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Ontario Building Code and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Ontario Building Code.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Concept Storage Solutions.

Use and Occupancy

2.1 The shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III, and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Ontario Building Code, as amended or remade from time to time.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be designed in accordance with Part 4 of the Ontario Building Code as amended or remade from time to time.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m

3.5 Lighting levels of walkways and platforms shall conform to the Ontario Building Code, as amended or remade from time to time.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2) and 3.2.7.4.(1) respectively of the Ontario Building Code, as amended or remade from time to time.

3.7 Guards and toe boards shall be installed in accordance with the Ontario Building Code, as amended or remade from time to time.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs A 4.3 and A 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph A 2.1 or clause c) of paragraph 3.4. above, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 - 1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Ontario Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Ontario Building Code as amended, except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m :

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Ontario Building Code, using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where: H_p = Horizontal travel distance on the shelf and rack storage (m)

V_p = Vertical travel distance on the shelf and rack storage (m)

H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Ontario Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Ontario Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a "positive lock" when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

5.8 Where 'at-level' conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two 'at-level' conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the 'at-level' cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each 'at-level' conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the 'at-level' cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each 'at-level' cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 6. A. above; or

   (b) the occurrence of any of the events described in Sections 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this Authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section 6 A 1.1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 6. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Dated at Toronto this 27th day of June 2002.

BMEC AUTHORIZATION	**BMEC # 02-02-273**
BMEC APPLICATION	**#A2002-04**

IPEX Single and Double PVC Apartment Fittings

1. Applicant

IPEX Inc.
Port of Montreal Building
Wing 3, 1st Floor, Cite du Havre
Montreal, Quebec
Canada
H3C 3R5

Tel: (514) 861-7221
Fax: (514) 861-9502

2. Manufacturing Facilities

IPEX Inc.
6810 Invader Crescent
Mississauga, Ontario
Canada
L5T 2B6

3. Description

The IPEX: Single PVC Apartment Fitting consists of: a 3"(75 mm) spigot and hub main fitting tee pipe, a 3" (75 mm) sanitary tee (hub), and two 1½" (150 mm) side inlets (hubs) at a 90^0 angle between each other. These side inlets are located above the sanitary tee branch and oriented 45^0 offset with reference to the sanitary tee.

The IPEX: Double PVC Apartment Fitting consists of: a 3"(75 mm) spigot and hub main fitting tee pipe, two diametrically opposite 3" (75 mm) sanitary tees (hub), four 1½" (150 mm) side inlets (hubs) at a 90^0 angle between each other. These side inlets are located above the sanitary tee branch and oriented 45^0 offset with reference to the sanitary tee.

4. Authorization requested

The applicant sought authorization for the use of the IPEX: Single and Double PVC Apartment Fittings as part of a drainage system for a multi storey apartment building using a modified stack configuration as referred to in Articles 7.2.4.5. and 7.2.4.1. of the 1997 Ontario Building Code as amended.

5. Assessment

Reports and assessments provided by the applicant demonstrate that if the IPEX: Single and Double PVC Apartment Fittings are constructed, installed, operated, maintained and monitored in accordance with the limitations of the manufacturer's specifications and the conditions stated in this authorization, a level of performance equivalent to that required by the 1997 Ontario Building Code as amended will be provided.

Reports assessments, information submitted, and reviewed:

1. Technical Background Information Memo relating to IPEX: Single and Double PVC Apartment Fittings, dated May 6, 2002.

2. CSA Certificate of Compliance for both single and double PVC Apartment fittings, issued January 19, 2001.

3. Minutes of Plumbing Officials' Association of British Colombia meeting of September 6, 2001.

4. Approval letter from the Regional Municipality of Halifax Plumbing Inspector, dated August 14, 2001.

5. Approval correspondence from the City of Winnipeg, Manitoba dated September 05, 2001.

6. CSA correspondence, dated January 12, 2001.

7. IPEX: Quality Control Manual of the final assembly, single fitting.

8. IPEX: Quality Control Manual of the final assembly, double fitting.

9. Installation Manual.

10. National Building Code of Canada, specific references.

6. Authorization

The IPEX: Single and Double PVC Apartment Fittings are authorized for use in a drainage system for a multi storey apartment building using a modified stack configuration as referenced in Articles 7.2.4.5. and 7.2.4.1. of the 1997 Ontario Building Code as amended, all other requirements pertaining to the installation of the IPEX: Single and Double PVC Apartment Fittings shall conform to the requirements of the 1997 Ontario Building Code as amended, and are subject to the following terms and conditions:

A. Specific Terms and Conditions

1. This authorization is valid only for IPEX's: Single and Double PVC Apartment Fittings ("the IPEX Fittings").

2. The IPEX Fittings shall be a factory assembled unit and shall not be site assembled.

3. The IPEX Fittings is permitted in single and double configurations as a specially designed device or system.

4. The IPEX Fittings shall meet the smoke and flame spread requirements of the 1997 Ontario Building Code as amended.

5. The IPEX Fittings shall not be used for modified stack venting in a high-rise building.

6. The IPEX Fittings shall not be installed within a supply or return air plenum.

7. The IPEX Fittings must be provided with a clean-out above the flood level rim of the highest fixture that the IPEX Fittings serves.

8. The IPEX Fittings shall be installed as per CSA B181.2, "PVC Drain, Waste, and Vent Pipe and Pipe Fittings."

9. The IPEX Fittings shall be marked, and certified to CSA B181.2, "PVC Drain, Waste, and Vent Pipe and Pipe Fittings" as single factory assembled unit.

B. General Conditions

1. The use of the IPEX: Single and Double PVC Apartment Fittings must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the Specific Terms and Conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Specific Terms and Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this authorization;

      (ii) the address of the applicant specified in Part 1 of this authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

(c) the applicant, or the material, system or building design that is the subject matter of this authorization, has failed to comply with any of the Specific Terms and Conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

5. Where the Commission receives additional information concerning the material, system or building design authorized herein, the Commission may review this Authorization and the Commission may after the review amend or revoke this Authorization as in the opinion of the Commission may be necessary.

Dated at Toronto this 30th day of May 2002.

EAGLE STEEL INC.
Shelf and Rack Storage System

1. Applicant

Eagle Steel Inc.
1870 Gage Court
Mississauga, Ontario
L5S 1S1

Tel: (905) 672-7010
Fax: (905) 672-7513

2. Manufacturing Facilities

Eagle Steel Inc.
1870 Gage Court
Mississauga, Ontario
L5S 1S1

3. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Ontario Building Code and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Ontario Building Code.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for Eagle Steel Inc.

Use and Occupancy

2.1 The shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III, and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Ontario Building Code, as amended or remade from time to time.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be designed in accordance with Part 4 of the Ontario Building Code as amended or remade from time to time.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m

3.5 Lighting levels of walkways and platforms shall conform to the Ontario Building Code, as amended or remade from time to time.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2) and 3.2.7.4.(1) respectively of the Ontario Building Code, as amended or remade from time to time.

3.7 Guards and toe boards shall be installed in accordance with the Ontario Building Code, as amended or remade from time to time.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs A 4.3 and A 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph A 2.1 or clause c) of paragraph 3.4. above, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 - 1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Ontario Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Ontario Building Code as amended, except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m :

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Ontario Building Code, using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)

V_p = Vertical travel distance on the shelf and rack storage (m)

H_m = Horizontal travel distance on the main floor (m)

N_{lg} = Number of lift gates in the means of egress

N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Ontario Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Ontario Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 6. A. above; or

   (b) the occurrence of any of the events described in Sections 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this Authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section 6 A 1.1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 6. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Amended at Toronto this 28th day of February 2002.

EZ Flow Drainage System

1. Applicant

Ring Industrial Group
65 Industrial Park Road
Oakland, Tennessee
USA, 38060

Tel: (877) 368 - 8294
Fax: (901) 465 - 1181

2. Manufacturing Facilities

EZ Flow
2175 Old Hendersonville Highway
Brevard, North Carolina
USA, 28712

EZ Flow
5050 Duncanville Road
Dallas, Texas
USA, 75236

EZ Flow
5840 US Highway 1 South
St. Augustine, Florida
USA, 32086

3. Description

The EZ Flow Drainage System is a subsurface drainage product which may replace stone, with a geo-synthetic aggregate. The EZ Flow Drainage System consists of a basic EZ Flow drain cylindrical bundle with 100 mm (4") pipe plus one or more cylindrical bundles of aggregate tubes (without pipe). The EZ Flow Drainage System is provided in prefabricated 3.0 m (10 foot) pipe and aggregate bundle lengths. The EZ Flow Drainage System is intended for use in a sewage system in lieu of the stone / distribution pipe arrangements within an absorption trench or filter bed.

4. Authorization Requested

The applicant sought authorization for use of the EZ Flow Drainage System as an alternative to the construction of absorption trenches as required by Section 8.7 of the Ontario Building Code. The applicant requested that the EZ Flow Drainage System be used to replace stone and distribution pipe in absorption trenches and filter beds that are:

(a) gravity fed, and
(b) “dosed” (non-pressurized distribution system)

Note: For the purposes of this authorization, “dosed” means a system in which effluent is pumped to the leaching bed either by pump or siphon, but the effluent is not pressurized within the leaching bed.

5. Assessment

Reports, assessments and information provided by the applicant indicate that if the EZ Flow Drainage System is designed and installed in accordance with the manufacturer's instructions and limitations, and the specific terms and conditions stated in this authorization, it will provide a level of performance that would be achieved by the conformance with the OBC.

Reports, assessments and information reviewed included the following:

1. Technical Background Information (TBI) Memo relating to EZ Flow Drainage System, dated 27 June 2001.

2. Video Tape: "EZ Flow : Generic Drainage Systems."

3. Alternative to gravel approval letter from the Ministry of Health and Ministry Responsible for Seniors in the Province of British Columbia, dated 24 April 1998.

4. Alternative to gravel approval letter from the Department of Insurance in the State of North Carolina, dated 17 February 1988.

5. Compliance Report Listing, Southern Building Code Congress International, Inc., No. 8971, date issued 12 January 2001.

6. Limited Usage approval letter, State of North Carolina, Department of Transportation, dated 23 May 1990.

7. Approval Letter, United States Department of Agriculture, State of Georgia.

8. Alternative to gravel approval letter from the Department of Insurance in the State of North Carolina, dated 21 January 1994.

9. "Building Codes Division Ruling on Acceptability of Material, Design or Method of Construction", Ruling No. 94-31, Oregon State Plumbing Speciality Code (OSPSC).

10. Instructions for the installation of EZ Flow Drainage System 1203H, 1006H, 1003H, 1006V, 1006T, 1003T, 1003V, and 1002V in the State of Alabama.

11. Instructions for Sizing EZ Flow Drainage Systems in the State of Alabama.

12. Technical Article "Comparison of EZ Flow Installations to a 3' Gravel Trench", dated 18 January 2001.

13. Instructions for the installation of EZ Flow Drainage Systems 1203H, and 1003H in the State of Florida.

14. Product specifications for geo-foam particles.

15. Product specifications for polystyrene aggregate.

16. Polyethylene drain pipe specifications.

17. Manufacturer's Information: Product Note 3.106, "Standard Pipe Perforations", dated January 2000.

18. Manufacturer's study "Report on Evaluation of Seven Year Old Eee Zzz Lay Effluent Drainfield Systems Installed in Two Feet Wide Trenches in Clay Soils (Class IV) in The State of Texas."

19. American Society of Agricultural Engineers, Paper No. 91-2578, "Sediment Retention Efficiencies of Sediment Basin Filtered Outlets.", dated 1991.

20. Retrospective Study "Survey and Study of Installed Expanded Polystyrene (Esp) Aggregate Onsite Sewage Treatment and Disposal Systems in Georgia: 1998 Thur 1998."

21. "Hydraulic Conductivity: an Evaluation of Drainage Media in Controlled Conditions" delivered 17 July 2001, prepared Donald Oderkirk, P.Eng, BPI, pllc, Memphis Tennessee.

22. "Determination of Hydraulic Conductivity of a Gravel System at the Trench Bottom", dated October 08, 2001.

* 23. BMEC Application A2004-01 "Amendment to BMEC #01-19-271 to Include EZ 1401P for Standard and Shallow Buried Trenches in Septic Fields."

* 24. "In-Ground Dispersal of Wastewater Effluent: The Science of Getting Water into the Ground" Kevin White, February 23, 2003.

* 25. Survey and Study of Installed Expanded Polystyrene (EPS) Aggregate Onsite Sewage Treatment and Disposal Systems in Georgia: 1989 thru 1998" presented by Sam Robertson 2000.

* 26. Assessment of Hardened EPS, Geosynthetic Systems Under Various Soil Conditions in Alabama" Kevin White, June 28, 2001.

6. Authorization

The use of the EZ Flow Drainage System is authorized in sewage systems within the scope of Part 8 of the Ontario Building Code 1997, as an alternative to stone and distribution pipes in absorption trenches and in filter beds, when installed in accordance with the manufacturer's recommendations and the Specific Terms and Conditions of this Authorization.

A. Specific Terms and Conditions

1. This authorization is valid only for EZ Flow Drainage System produced by Ring Industrial Group.

2. This authorization is valid only for the EZ Flow Drainage Product designated:

   (a) 1202H, 300 mm (12") diameter, where two cylindrical bundles of the product shall be installed side by side, in a 600 mm (24") wide trench, one cylindrical bundle shall be of solid aggregate fill (without pipe) and the other cylindrical bundle (with pipe) shall be of aggregate and drainage tile, or

   (b) 1003T, 250 mm (10") diameter, where three cylindrical bundles are installed in a triangular configuration, with two solid aggregate fill cylindrical bundles (without pipe) side by side on the bottom, and an aggregate and drainage tile cylindrical bundle (with pipe) which shall be placed on top of the two cylindrical aggregate bundles to form a triangle, in a 600 mm (24") wide trench.

* (c) 1401P, 350 mm (14") diameter, where one cylindrical bundle is installed in trench not more than 600 mm (24") wide.

3. The drainage tile shall comply with ASTM F405.

4. The EZ Flow Drainage System shall be stored in UV protective plastic film bags, and the UVI (Ultra Violet Inhibitor) treated shipping bags shall serve to protect the product from UV degradation prior to installation.

5. The EZ Flow Drainage System shall be covered by a two (2) year manufacturer warranty.

6. When the EZ Flow Drainage System is installed in lieu of distribution piping and stone, the length of this installation shall equal the required lengths of distribution pipe specified in Article 8.7.3.1.

7. A barrier cover shall be placed over the top of the EZ Flow Drainage System prior to backfilling, and the barrier cover shall be a permeable filtration fabric of the type recommended by the manufacturer.

8. The EZ Flow Drainage System shall be covered with a minimum of 150 mm (6") of backfill as per Sentence 8.7.2.1(2) of the OBC.

* 8.1. The EZ Flow 1401P may be used in shallow buried trench installations provided that the total trench depth to the finished grade is not greater than 600 mm (24").

9. When the EZ Flow Drainage System is installed in lieu of distribution piping and stone, the leaching beds shall satisfy the general construction requirements specified in Section 8.7. of the OBC.

10. The minimum clearance distances required by Article 8.2.1.6. for distribution piping shall be met by the EZ Flow Drainage System.

11. When installed in lieu of distribution piping and stone in filter beds, the cylindrical bundles of the EZ Flow Drainage System shall be placed side by side to cover the surface of the filter medium to which the sewage effluent is applied, and the maximum spacing between the cylindrical bundles (with pipe) shall not be greater than 1.2 m (3.9').

12. When used in gravity fed conditions, the EZ Flow Drainage System shall be:

(a) installed such that all joints between EZ Flow components and where the EZ Flow product joins other pipes are to be securely connected, and

(b) free of structural damage and used full length (not cut),

13. Where the sewage effluent is “dosed” to the leaching bed by pumps or a siphon, the EZ Flow Drainage System shall:

(a) pump the effluent into a header line or distribution box to achieve uniform distribution over the entire absorption bed or trenches and,

(b) comply with the requirements of Sentence 8.6.1.3.(4) of the OBC.

B. GENERAL CONDITIONS

1. The use of the EZ Flow Drainage System must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:
(a) the failure of the applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the Specific Terms and Conditions set out in 6. A. above; or

(b) the occurrence of any of the events described in Specific Terms and Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this authorization;

(ii) the address of the applicant specified in Part 1 of this authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the applicant, or the material, system or building design that is the subject matter of this authorization, has failed to comply with any of the Specific Terms and Conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 25th day of March 2004.

2175 Old Hendersonville Highway
Brevard, North Carolina
USA, 28712

EZ Flow
5050 Duncanville Road
Dallas, Texas
USA, 75236

EZ Flow
5480 US 1 South
St. Augustine, Florida
USA, 32086

3. Description

The EZ Flow Drainage System is a subsurface drainage product which may replace crushed stone, with a geo-synthetic aggregate. The EZ Flow Drainage System consists of a 100 mm (4")diameter prefabricated flexible pipe surrounded by 100 mm (4") of an expanded polystyrene aggregate which is held together with a polyethylene netting. The total diameter of the EZ Flow Drainage System referred to within this Authorization is 300 mm (12"). The EZ Flow Drainage System is provided in prefabricated 3.0 m (10 foot) pipe and aggregate bundle lengths.

4. Authorization Requested

The applicant sought authorization for the use of EZ Flow Drainage System as an equivalent to the level of performance required by Part 9: Subsection 9.14.2., Subsection 9.14.3., and Subsection 9.16.3. of the 1997 Ontario Building Code (OBC) as amended.

5. Assessment

Reports, assessments and information provided by the applicant indicate that if the EZ Flow Drainage System is designed and installed in accordance with the manufacturer's instructions and limitations, and the specific terms and conditions stated in this authorization, it will provide a level of performance that would be achieved by the conformance with the OBC.

Reports, assessments and information reviewed included the following:

1. Technical Background Information (TBI) Memo relating to EZ Flow Drainage System, dated 27 June 2001.

2. Video Tape: "EZ Flow : Generic Drainage Systems."

3. Alternative to gravel approval letter from the Ministry of Health and Ministry Responsible for Seniors in the Province of British Columbia, dated 24 April 1998.

4. Alternative to gravel approval letter from the Department of Insurance in the State of North Carolina, dated 17 February 1988.

5. Compliance Report Listing, Southern Building Code Congress International, Inc., No. 8971, date issued 12 January 2001.

6. Limited Usage approval letter, State of North Carolina, Department of Transportation, dated 23 May 1990.

7. Approval Letter, United States Department of Agriculture, State of Georgia.

8. Alternative to gravel approval letter from the Department of Insurance in the State of North Carolina, dated 21 January 1994

9. "Building Codes Division Ruling on Acceptability of Material, Design or Method of Construction", Ruling No. 94-31, Oregon State Plumbing Speciality Code (OSPSC).

10. Instructions for the installation of EZ Flow Drainage System 1203H, 1006H, 1003H, 1006V, 1006T, 1003T, 1003V, and 1002V in the State of Alabama.

11. Instructions for Sizing EZ Flow Drainage Systems in the State of Alabama.

12. Technical Article "Comparison of EZ Flow Installations to a 3' Gravel Trench", dated 18 January 2001.

13. Instructions for the installation of EZ Flow Drainage Systems 1203H, and 1003H in the State of Florida.

14. Product specifications for geo-foam particles.

15. Product specifications for polystyrene aggregate.

16. Polyethylene drain pipe specifications.

17. Manufacturer's Information: Product Note 3.106, "Standard Pipe Perforations", dated January 2000.

18. Manufacturer's study "Report on Evaluation of Seven Year Old Eee Zzz Lay Effluent Drainfield Systems Installed in Two Feet Wide Trenches in Clay Soils (Class IV) in The State of Texas."

19. American Society of Agricultural Engineers, Paper No. 91-2578, "Sediment Retention Efficiencies of Sediment Basin Filtered Outlets.", dated 1991.

20. Retrospective Study "Survey and Study of Installed Expanded Polystyrene (Esp) Aggregate Onsite Sewage Treatment and Disposal Systems in Georgia: 1998 Thur 1998."

21. "Hydraulic Conductivity: an Evaluation of Drainage Media in Controlled Conditions" delivered 17 July 2001, prepared Donald Oderkirk, P.Eng, BPI, pllc, Memphis Tennessee.

6. Authorization

The EZ Flow Drainage System may replace crushed stone and drainage tile around the foundation of a building as described in Part 9 of the OBC subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. This authorization is valid only for the 300 mm (12") diameter EZ Flow Drainage System.

2. The drainage tile shall comply with ASTM F405.

3. The top most surface of the 100 mm (4") drainage tile portion of the EZ Flow Drainage System shall not be higher than the underside of the floor slab or crawl space.

4. The EZ Flow Drainage System shall be placed directly adjacent to the footings, and assembled in accordance with the manufacturer's recommendations.

5. The EZ Flow Drainage System shall be stored in BOMARK 100, Inc. UVI (Ultra Violet Inhibitor) treated bags prior to installation to protect the product from UV degradation.

6. The EZ Flow Drainage System shall be covered by a two (2) year manufacturer warranty.

7. A barrier cover shall be placed over the top of the EZ Flow Drainage System prior to backfilling, and the barrier cover shall be a permeable filtration fabric of the type recommended by the manufacturer.

8. The EZ Flow Drainage System shall be placed on well compacted or undisturbed soil.

9. The EZ Flow Drainage System shall be covered with a minimum of 150 mm (6") of well compacted backfill.

10. The perimeter of the footing shall be free of water at the time of the installation.

11. The EZ Flow Drainage System shall be installed to drain water away from the footings and foundations of the building.

B. GENERAL CONDITIONS

1. The use of the EZ Flow Drainage System must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the Specific Terms and Conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Specific Terms and Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this authorization;

(ii) the address of the applicant specified in Part 1 of this authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the applicant, or the material, system or building design that is the subject matter of this authorization, has failed to comply with any of the Specific Terms and Conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 25th day of October 2001.

DATE OF AUTHORIZATION **August 30, 2001**
BMEC AUTHORIZATION **BMEC # 01-17-269**
BMEC APPLICATION **# A 2001-17**

TRI-FLEX® 30
Flexia Corporation

1. Applicant

Flexia Corporation
369 Elgin Street
Brantford, Ontario
N3S 7P5

Tel: (519) 759 - 2500
Fax: (519) 759 - 6950

2. Manufacturing Facilities

Flexia Corporation
369 Elgin Street
Brantford, Ontario
N3S 7P5

Flexia Corporation
19680-94A Avenue
Langley, British Colombia
V1M 3B7

3. Description

The Tri-Flex ® 30 is a roof underlayment manufactured by Flexia Corporation. Tri-Flex ® 30 is a 85 g/m^2 spun bonded polypropylene consisting of a structural core with a thin layer of polypropylene on both sides, it has a composite weight of 132 g/m^2. Tri-Flex ® 30 is designed for use as an alternative underlayment beneath roofing systems where No. 15 and No. 30 roof felts are currently used. Tri-Flex ® 30 membrane roofing underlayment can be applied directly to a nailable structural roof deck and is mechanically fastened using plastic cap underlayment nails or staples.

4. Authorization requested

The applicant sought authorization for the use of the Tri-Flex ® 30 Roof Underlayment as an alternative to the material requirements described in the 1997 Ontario Building Code as amended Subsection 9.26.2. ”Roofing Materials”.

5. Assessment

Reports and assessments provided by the applicant indicate that if the Tri-Flex ® 30 Roof Underlayment is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, and the specific terms and conditions stated in this authorization, the level of performance required by the Ontario Building Code will be provided.

Reports, assessments and information reviewed included the following:

1. CSA: A123.3-98: " Asphalt Saturated Organic Roofing Felt", dated December 1998.

2. ITS: Intertek Testing Services "Report of Product Evaluation Conducted on Tri-Flex ® 30 High Tech Roofing Underlayment", Report # 488-1029 (CSA), dated April 15, 1999, revised May 10, 2000 and revised July 7, 2000.

3. ICBO Evaluation Service, Inc., Evaluation Report, ER-5843, Issued September 1, 2000, Filing Category "Roof Covering and Roof Deck Construction - Underlayment".

4. BOCA International Evaluation Report, Research Report 21.49, "Section 07310 - Shingles", printed April 2001.

5. Underwriters Laboratories Inc., File R20507, Project 00NK40745, dated January 3, 2001, "Report on 'Prepared Roof Covering Accessory' under the Classification Program".

6. Flexia Corporation manufacturer's information, "Tri-Flex ® 30: Installation Guide".

7. ITS: Intertek Testing Services "Quality Control Manual for Tri-Flex ® 30 Roof Underlayment", dated May 2000.

8. SBCCI, Report Number 2048 " Roof Covering and Roof Deck Construction", Copyrighted 2000.

9. Technical Background Information Memo relating to Tri-Flex ® 30 Roof Underlayment dated 26 July 2001.

6. Authorization

The Tri-Flex ® 30 Roof Underlayment is authorized as an alternative to the material requirements described in the Subsection 9.26.2. "Roofing Materials" of the 1997 Ontario Building Code as amended. All other requirements pertaining to the installation of the Tri-Flex ® 30 Roof Underlayment shall conform to the requirements of the 1997 Ontario Building Code as amended, and subject to the following terms and conditions:

A. Specific Terms and Conditions

1. This Authorization is valid only for Flexia Corporation.

2. The Tri-Flex ® 30 Roof Underlayment may be used as a roof underlayment material beneath shingles, tiles or other roofing materials as permitted in Article 9.26.6.1. "Materials."

3. The Tri-Flex ® 30 Roof Underlayment shall not be used in applications where hot asphalt is applied.

4. The Tri-Flex ® 30 Roof Underlayment shall not be used as a vapour barrier.

5. The Tri-Flex ® 30 Roof Underlayment shall not be used beneath wood shingles or shakes as described in Subsections 9.26.9 and 9.26.10 of the 1997 Ontario Building Code as amended.

6. The Tri-Flex ® 30 underlayment shall not be used in roofing applications such as but not limited to cathedral ceilings and others roofing applications with roof slopes as described in Sentence 9.19.1.2.(2) of the 1997 Ontario Building Code as amended.

7. The Tri-Flex ® 30 Roof Underlayment may be permitted for use as an eave protection material according to Article 9.26.5.2. only when installed in accordance with "The Tri-Flex ® 30 High Tech Roof Underlayment Installation Guide": where two layers of the Tri-Flex ® 30 Roof Underlayment are solidly cemented together, lapped 480 mm at any butt joints between solidly cemented layers, and applied in sufficient courses to meet the requirements of Sentence 9.26.5.1.(1) of the 1997 Ontario Building Code as amended.

8. The Tri-Flex ® 30 Roof Underlayment shall be installed in accordance with the "Tri-Flex ® 30 High Tech Roofing Underlayment Installation Guide" and subject to the Specific Terms and Conditions of this authorization.

B. General Conditions

1. The use of the Tri-Flex ® 30 Roof Underlayment shall comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

BUILDING MATERIALS EVALUATION COMMISSION
(BMEC)
AUTHORIZATION REPORT

DATE OF AUTHORIZATION **August 30, 2001**
BMEC AUTHORIZATION **BMEC # 01-16-268**
BMEC Application **# A 2001-16**

PRO*PRESS*™

1. Applicant

Viega NA
Plumbing and Heating Systems
17545 Daleview Drive
Lakewood, Ohio
U.S.A.
44107

Tel: (216) 228-5224
Fax: (216) 228-9574

2. Manufacturing Facilities

Viega
Franz Viegener II
Ennester Weg 9
Attendorn, Germany
57439

3. Description

The Pro*Press*™ System is designed and manufactured by Viega Inc. It is a copper joining technology without the use of traditional practice of soldering. This system utilizes 12.7 mm to 50.8 mm (½" to 2") copper or bronze fittings having an elastomeric seal incorporated within the socket's fitting. The fitting is designed to be pressed with the use of a special design power tool (i.e. electro-hydraulic crimping tool fitted with interchangeable crimping jaws) under substantial pressure to form a watertight sealed joint. In addition, this special tool must be maintained and calibrated in order to perform as suggested by the manufacturer.

The manufacturer has stated that, the fittings are rated for 1479 Kpa (200 psi) and tested to 4135 Kpa (600 psi) of pressure at temperatures between -17 ^{0}C to 121 ^{0}C (0 ^{0}F - 250 ^{0}F); and they can resist all forces normally encountered in a plumbing system.

4. Authorization Requested

The applicant sought authorization for the use of the Viega Pro*Press*™ System in lieu of traditional practice of soldering pipes in a hot and cold water plumbing system as required by Article 7.2.7.6. "Solder-Joint Water Fittings" and Article 7.3.2.7. "Mechanical Joints" of the 1997 Ontario Building Code as amended (OBC).

5. Assessment

Reports and assessments provided by the applicant indicate that if the Viega Pro*Press*™ System is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, and the specific terms and conditions stated in this authorization, the level of performance required by the 1997 Ontario Building Code as amended will be provided.

Reports, assessments and information reviewed included the following:

1. Viega / Rigid manufacturer's information "Turn off Your Torch, Toss out Your Solder, Introducing A Better Way to Join Copper", dated 1999 Ridgid Tool Company.

2. Viega / Rigid manufacturer's information "Product Catalogue: A Better Way to Join Copper", dated 2000 Ridgid Tool Company.

3. Technical Background Information Memo relating to Viega Pro*Press*™ System dated 23 July 2001.

4. CSA International Certificate of Compliance, Compliance #1116260, Project #1116260, Master Contract # 205817, issued to: Viega NA: Plumbing and Heating Systems, 17545 Daleview Drive, Lakewood, OH, 44107 issued January 2, 2001.

5. CSA International Certificate Record, file #2058170000, submitted by: Viega NA: Plumbing and Heating Systems, 17545 Daleview Drive, Lakewood, OH, 44107, dated January 2, 2001.

6. CSA International Supplement to Certificate Record, file #1116260, Project #1116260, Master Contract # 205817, issued to: Viega NA: Plumbing and Heating Systems, 17545 Daleview Drive, Lakewood, OH, 44107 issued January 2, 2001.

7. IAPMO Research and Testing, Inc., Certificate of Listing, accepted January 2001, file # 3965, Applicant: Viega, Franz Viegener II, Ennester Weg 9, Attendorn, Germany, 57439.

8. NSF International Report, Issuance date 23 September 1999, client: Viega, Franz Viegener II, Ennester Weg 9, Attendorn, Germany, 57439.

9. Viega / Rigid manufacturer's information "Ridgid: CT 400."

10. Viega / Rigid manufacturer's information "Pro*Press*™ Components."

11. Viega / Rigid specification "COPPER TUBING AND FITTINGS: Section #15125", dated 08/29/01

6. Authorization

The Viega Pro*Press*™ System is authorized in lieu of the traditional practice of soldering pipes in a hot and cold plumbing system as required by Article 7.2.7.6. “Solder-Joint Water Fittings” and Article 7.3.2.7. “Mechanical Joints” of the 1997 Ontario Building Code as amended. All other requirements pertaining to the installation of the Viega Pro*Press*™ System shall conform to the requirements of the 1997 Ontario Building Code as amended, and subject to the following terms and conditions:

A. Specific Terms and Conditions

1. This authorization is valid only for the Viega Pro*Press*™ System.

2. The Viega Pro*Press*™ System shall only be used in hot and cold water plumbing systems in above ground applications.

3. The Viega Pro*Press*™ System shall not be used in a fire protection system.

4. The Viega Pro*Press*™ System shall only be used in conjunction with:

   (a) Ridged CT 400 electro-hydraulic crimping tool, and

   (b) Viega Pro*Press*™ Jaw Sets sizes: ½", 3/4", 1", 1 1/4", 1 ½" and 2".

5. Each fitting shall be permanently marked with the manufacturer’s name and the nominal size.

4. The Viega Pro*Press*™ System shall only be used with 12.7 mm to 50.8 mm (½" to 2") copper or bronze tubing.

6. The Viega Pro*Press*™ System elastomeric seal, (an EPDM o-ring) shall be made of a non-toxic synthetic rubber that meets the requirements of ASTM D2000.

7. The Viega Pro*Press*™ System copper fittings shall comply with the material requirements of ANSI/ASME B16.22 and the chemical components requirements ASTM B88.

8. The Viega Pro*Press*™ System shall comply with NSF 61.

9. Fittings used in the Viega Pro*Press*™ System shall be manufactured by Viega, Franz Viegener II, Ennester Weg 9, Attendorn, Germany, 57439; and distributed by an authorized dealer(s).

10. Viega Pro*Press*™ System fittings shall not be used with oils or lubricants, and shall be kept protected and free from moisture, damage, and dirt.

11. Viega Pro*Press*™ System connection shall be made in accordance with the manufacturer’s installation instructions:

(a) the tubing shall be fully inserted into the fitting and the tubing marked at the shoulder of the fitting,

(b) the fitting alignment shall be checked against the mark on the tubing to assure the tubing is fully inserted in the fitting, and

(c) the joint shall be pressed using the tool(s) referred to in Specific Term and Condition # 4.

B. General Conditions

1. The use of the Viega Pro*Press*™ System shall comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

(b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto on this 30th day of August 2001

BUILDING MATERIALS EVALUATION COMMISSION

BUILDING MATERIALS EVALUATION COMMISSION (BMEC) AUTHORIZATION REPORT

DATE OF AUTHORIZATION **August 30, 2001**
BMEC REFERENCE **BMEC # 01-15-267**
BMEC APPLICATION # **BMEC # A2001- 14**

ALUMATEK
Vertical Rolling Grilles

1. Applicant

Alumatek
National Headquarters
680 West 200 North
North Salt Lake, Utah
USA, 84054

Tel: (800) 647 -7049
Fax: (866) 936 -1941

2. Manufacturing Facilities

Alumatek
National Headquarters
680 West 200 North
North Salt Lake, Utah
USA, 84054

3. Description

The Alumatek vertical rolling grille is a vertical rolling security grille with guide channels on both sides of the opening and a lock at the bottom of the door. The vertical rolling grille will be opened and closed electronically. In the event of a power failure the vertical grille can be opened mechanically through the use of an emergency release device. When the emergency release device is activated torsion springs will open the grille to a preset height.

4. Authorization Requested

The applicant sought authorization for the use of their product as an equivalent means of egress presently permitted by Sentence 3.3.1.11.(3) and F3 (low hazard Industrial) of the 1997 Ontario Building Code as amended.

5. Assessment

Reports, assessments and information provided by the applicant indicate that if the Alumatek Vertical Rolling Grille, was performance tested and installed in accordance with the manufacturer's instructions and limitations and with the Specific Terms and

Conditions stated in this Authorization, the level of performance required by the 1997 Ontario Building Code as amended will be provided.

Reports, assessments and information reviewed included the following:

1. Rolling Grille Installation Instructions.

2. Quality Control Manufacturing Measures and Rolling Grille Check List.

3. National Fire Protection Association (NFPA) 101 "Life Safety Code", Section 5-21.4. "Swing and Force to Open".

4. BOCA National Building Code / 1999, "Means of Egress", Section 1017.5.

5. 1998 California Building Code, Section 1003.3.1.

6. International Building Code 2000.

7. Alumatek instructional video tape.

6. Authorization

The Alumatek vertical rolling grille is authorized subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. This authorization is valid only for Alumatek Inc.

2. The Alumatek vertical rolling grille shall remain in the full open position during the period of occupancy by the general public.

3. The Alumatek vertical rolling grille shall only be installed in sprinklered occupancies.

4. Not more than half of the means of egress shall be equipped with the Alumatek vertical rolling grilles.

5. The Alumatek vertical rolling grille shall only be installed for use in Group D (Business and Personal Service), E (Mercantile), and F3 (Low Hazard Industrial) occupancies.

6. The Alumatek vertical rolling grille shall only be used in interior applications, and in applications where the grille will not be exposed to moisture.

7. The maximum width of a Alumatek vertical rolling grille shall not exceed 9.2 m.

8. The emergency release device shall be located in an accessible location not exceeding 1000 mm from either of the vertical rolling grille door jambs.

9. Adjacent to the emergency release device there shall be a readily visible, permanently mounted, durable:

   (a) sign in letters at least 25 mm high on a contrasting background that reads, "EMERGENCY RELEASE DEVICE SHALL NOT BE VISUALLY OBSTRUCTED", and

   (b) directional sign (an arrow) which will prominently indicate the location of the emergency release device.

10. Adjacent to the emergency release device there shall be a readily visible, permanently mounted, durable sign in letters at least 25 mm high on a contrasting background that reads "TO OPEN DOOR, PULL LEVER.'"

11. On the bottom rail of the Alumatek vertical rolling grille there shall be a readily visible, permanently mounted, durable sign in letters at least 25 mm high on a contrasting background that reads " THIS DOOR TO REMAIN IN THE FULL OPEN POSITION DURING THE PERIOD OF OCCUPANCY BY THE GENERAL PUBLIC."

12. On the opposite door jamb to that of the emergency release device there shall be a readily visible, permanently mounted, durable sign in letters at least 25 mm high on a contrasting background that reads "EMERGENCY RELEASE DEVICE IS LOCATED ON THE OPPOSITE SIDE OF THE DOOR."

13. Alumatek vertical rolling grille and the emergency release device shall be annually inspected and tested; and written records of these inspections and tests after they are made shall be kept for a period of not less than 2 years.

14. When in the open position the Alumatek vertical rolling grille shall have a minimum preset height of 2100 mm.

15. All staff shall be trained and be familiar with the location, operation, and use of the Alumatek vertical rolling grille and the emergency release device.

16. The Alumatek vertical rolling grille shall be installed as per the manufacturer's instructions "Rolling Grille Installation Instructions."

17. The Alumatek vertical rolling grille shall be installed and assembled as per the quality control manufacturing measures and "Alumatek Rolling Grille Check List."

18. The emergency release device (EDR) shall be installed as per the manufacturer's instructions "Lift-Master: Emergency Egress Device Modification Flush or Extended Handle 'Installation Instructions'."

B. General Conditions

1. The use of the Alumatek vertical rolling grille shall comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

AUTHORIZATION REPORT- NORWECO Singulair® Alternate Tertiary Discharge Area Bed System

1. Applicant

Norweco Equipment Company
220 Republic Street
Norwalk, Ohio
USA
44857-1196

Tel: (419) 668 - 4471
Fax: (419) 663 - 5440
Web: www.Norweco.com

2. Manufacturing Facilities

Norweco Equipment Company
220 Republic Street
Norwalk, Ohio
USA
44857-1196

3. Description

The Norweco Singulair® Alternate Tertiary Discharge Area Bed System (the " Norweco Area Bed") is primarily comprised of a tertiary treatment unit, an effluent filter and an area bed.

The tertiary treatment units permitted for use with this system are referenced in the Supplementary Guidelines to the Building Code, as amended, as meeting tertiary quality effluent criteria and include models 960-500-2000, 960-750-3000, 960-1000-4000, 960-1250-4750, and 960-1500-5700.

An effluent filter is required downstream of the treatment unit. The specification of the effluent filter may vary depending on the Area Bed System design, and the filter models specified for use with the Norweco Area Bed may be located in section 6.A.4. of this authorization.

An area bed is comprised of two parts; the stone layer and the sand layer.

The sand layer of an area bed is sized in consideration of the soil it rests on, and under certain conditions, it may be required to be laterally extended. This lateral sand layer extension is known as the mantle. The effluent is sent to the stone layer, either by gravity or pressure from a pump, via a pipe. This pipe leads from the treatment unit and terminates at the distribution box or header. From the distribution box or header, the effluent is sent to a series of perforated distribution pipes that run through the stone layer.

4. Authorization requested

The applicant sought an Authorization for an Norweco Area Bed System as an equivalent to a other Class 4 sewage systems as referenced in Section 8.7. “Leaching Beds” of the Building Code.

5. Assessment

Reports and assessments provided by the applicant show that if the Norweco Area Bed is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, the Building Code and the specific terms and conditions stated in this authorization, the level of performance required by the Building Code will be provided.

Reports submitted and reviewed:

1. NORWECO Singulair® Systems Owners Manual, Models 960-500, 960-750, 960-1000, 960-1250 or 960-1500 Treatment Unit, which incorporates a schedule of required maintenance to be conducted on the system every six (6) months.

2. Technical Background Information Memo relating to NORWECO Singulair® Systems dated February 19, 2001 and February 27, 2001.

3. CAN/CSA-B66-00 - Prefabricated Septic Tanks and Sewage Holding Tanks, Plumbing Products and Materials - a National Standard of Canada.

4. State of Washington Singulair® Model 960 Performance Evaluation Summary Report.

5. NSF Wastewater Technology Report, Singulair® Model 960, dated April 1996.

6. NSF Wastewater Technology Report, Singulair® Model 960 Supplemental Report, dated March 1997.

7. CSA International Certificates of Compliance.

8. NSF International Official Listing.

9. Singulair® Model 960 Installation Manual.

10. Singulair® Model 960 Service Manual.

11. Application A2005-05: Amendment to Norweco, January 31, 2005 to the Building Materials Evaluation Commission.

12. Van Harten Surveying Inc.'s Report, April 27, 2005, ref.16220-05.

6. Authorization

The Norweco Area Bed System is authorized as an equivalent to other Class 4 sewage systems as referenced to in Section 8.7. "Leaching Beds" of the Building Code; all other requirements pertaining to the design, installation and construction are subject to the regulations of the Building Code, and to the following terms and conditions:

A. Specific Terms & Conditions

1.0. Definitions

A word or phase used in this Authorization has the following meaning for the purposes of this Authorization:

Area Bed means the part of a leaching bed comprised of a stone layer and the underlying unsaturated sand layer intended to further treat and distribute the effluent, and does not include the area referred to as the mantle.

Contact Area means the area of infiltrative surface, directly below the area bed, required to absorb the treated effluent into the underlying native soil, but does not include the area where the mantle, if required, comes into contact with the native soil.

Extended Contact Area means the area of the sand bed, as extended, and mantle, where required, to meet the necessary lateral extension such that the effluent is absorbed into the underlying soil

Infiltrative Surface means the area of interface where effluent migrates downward from the sand layer of the area bed and, if necessary, the mantle and passes into the native soil or leaching bed fill.

Mantle means the lateral extension of the area bed using imported leaching bed fill having a T time of 15 min/cm or less, but does not include the area referred to as the area bed, necessary to provide an area of hydraulic catchment in any direction in which the effluent entering the leaching bed fill will move horizontally such that effluent is treated and absorbed.

Raised or Partially Raised Area Bed means a sewage system in which any part of the leaching bed is above the natural ground elevation.

Uniform Distribution means the even dispersal of effluent throughout all areas of an area bed and adjoining mantle, if required, as it migrates down from the stone layer to the underlying sand layer to either the native soil or mantle comprised of imported soil.

Vertical Separation means the depth of unsaturated soil below a leaching bed as measured from the bottom of the absorption trench or the bottom of the stone layer to a limiting surface such as high ground water table, rock or soil with a percolation time greater than 50 min/cm.

2.0 Installation Requirements

2.1. This Authorization is valid only for Norweco Inc.

2.2. Only Norweco manufacturer trained and authorized agents or employees shall install, maintain and service the Area Bed System.

2.3. The Norweco Area Bed System shall be installed as per the manufacturer's installation instructions.

2.4. The Service and Maintenance Agreement prescribed by Sentence 8.9.2.3.(2) of the Building Code requires that the persons authorized by the manufacturer to service and maintain Area Bed System and who have entered into the agreement with the person operating the treatment unit, and shall:

2.4.1. conduct and record at least once during every six month period, an inspection and servicing as specified by the manufacturer of the Norweco treatment unit in the "Continuing Maintenance Manual"; and provide a copy to the person operating the Area Bed System;

2.4.2. provide a copy of the "Continuing Maintenance Manual" to the person operating the Area Bed System and to the authority having jurisdiction at the time of the permit application;

2.4.3. conduct sampling and testing in accordance with the requirements of Clauses 8.9.2.4.(1)(a) and (b) of the Building Code;

2.4.3.1. once during the first 12 months after the Area Bed is put into use, and

2.4.3.2. thereafter, once during every 48 month period after the previous sampling has been completed,

2.4.4. promptly submit the sampling test results to the person operating the system and Norweco treatment unit, and

2.5. Norweco Inc. shall retain records of the sampling test results for each Area Bed System received pursuant to the terms and conditions set out in 2.4. above, for a period of 10 years and shall promptly forward copies of those records to a chief building official upon request.

3.0 System Requirements

3.1. All pipe connections in the system (i.e. pretreatment chamber, treatment units, accessory treatment units, tanks, pumps and filters) where incorporated, shall be flexible and watertight.

3.2. The Norweco treatment units used in the system shall use the daily design sewage flows as referenced in Table 3.2.1. "Daily Design Flow":

Table 3.2.1.
Daily Design Flow

Treatment Unit Models	**Flow Range** **measured in Litres**
960-500-1000	1100 to 2000
960-750-3000	2000 to 3000
960-1000-4000	3000 to 4000
960-1250-4750	4000 to 4750
960-1500-5700	4750 to 5700
Column 1	Column 2

4.0. Design

4.1. The Norweco treatment unit shall be fitted with a bottomless sand filter, or a Singulair® Bio-Kinetic Filter.

4.2. An absorption system comprised of a stone layer overlying a sand layer and having a total minimum depth of 500 mm, and:

4.2.1. the stone layer shall be a minimum depth of 200 mm, and

4.2.2. the sand layer shall be a minimum depth of 250 mm and have a percolation time of 6 to 10 min/cm.

4.3. The stone layer required by 4.2. above, shall have a minimum area as specified by the manufacturer but not less than:

4.3.1. where the total daily design sanitary sewage flow does not exceed 3000 L, the area shall be such that the loading on the surface of the stone layer does not exceed 75 L/m² per day, or

4.3.2. where the total daily design sanitary sewage flow exceeds 3000 L, the area shall be such that the loading on the surface of the stone layer does not exceed 50 L/m² per day.

4.4. The stone layer required by the terms and conditions set out in 4.2. above, shall be protected with a permeable geo-textile fabric in such a manner so as to prevent soil or leaching bed fill from entering the stone.

4.5. The bottom of the stone layer shall be at all points vertically separated at least 600 mm from the high ground water table, rock or soil with a T time of 6 or less, or greater than 50 min/cm; except:

4.5.1. where the underlying soil has a T time of between 6 and 50 min/cm, the bottom of the stone layer at all points may be reduced to 450 mm to rock, high water table, and soil having a T time of 50 min/cm.

4.6. The effluent shall be evenly distributed over the stone layer to within 600 mm of the perimeter edge of the stone layer using distribution pipes in accordance with the Building Code Appendix A-8.7.5.3.(2); or other means that achieve even distribution to within 600 mm of the perimeter edge of the stone layer.

4.7. The sand layer shall have a minimum area that is the greater of;

4.7.1. the area of the stone layer required by the terms and conditions set out in 4.3. above,

4.7.2. where the sand layer is installed in soil having a T time of 15 min/cm or less, the loading rate at the base of the area bed, shall be calculated using the formula $A = QT/850$ ($L/m^2/day$), or

4.7.3. where the sand layer is installed in or on soil having a T time of greater than 15 min/cm, that the sand layer be extended using imported leaching bed fill having a T time of not more than 15 min/cm; the construction of the extended sand layer, including the area bed and mantle shall:

4.7.3.1. be to a depth of at least 250 mm,

4.7.3.2. extend at least 15 m beyond the distribution pipes in any direction that the effluent entering the soil will move horizontally, and

4.7.3.3. be calculated using the formula A = QT/400 or by using the example calculations as they are provided, in Table 4.7.3.3. “Combined Area Bed and Mantle Loading Rates”

Where:

A is the area of contact in m^2 between the base of the sand layer and the underlying native soil,

Q is the total daily design sanitary sewage flow in litres, and

T is the percolation time of the underlying native soil in min/cm to a maximum of 50.

Table 4.7.3.3.
Combined Area Bed and Mantle Loading Rates Example Calculations

Loading Rate A = QT/400	
T of the native soil.	Loading rate (L/m^2/day)
≤ 15	27
20	20
30	13
40	10
≥50	8
Column 1	Column 2

4.8. Any Area Bed System that must be raised to meet the vertical separation distances required by the terms and conditions set out in 4.5. of this Authorization, shall meet the mantle requirements of the terms and conditions set out in 4.7., regardless of the T time of the native soil.

B. General Conditions

1. The use of the Norweco Area Bed System, and as described in the specific terms and conditions set out in 6.A. must comply with the *Building Code Act, 1992* (the “Act”) as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6.A. above; or

   (b) the occurrence of any of the events described in conditions 6.B.4.(a) and (b)(ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the Act any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

   (d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 26 day of May 2005.

BUILDING MATERIALS EVALUATION COMMISSION

_____

Edward Link, Vice-Chair

BUILDING MATERIALS EVALUATION COMMISSION
(BMEC)
AUTHORIZATION REPORT

DATE OF AUTHORIZATION **July 26, 2001**
BMEC REFERENCE **BMEC # 01-13-265**
BMEC APPLICATION **# 2001-12**

DATE OF AMENDMENT **November 27, 2003**
* Denotes November 27, 2003 amendments

ECONO-RACK GROUP LTD.
Shelf and Rack Storage System

1. Applicant

* Econo-Rack Group Ltd.
2655 North Sheridan Way, Suite 230
Mississauga, Ontario
L5K 2P8

Tel: (905) 403-0101
Fax: (905) 403-1510

2. Manufacturing Facilities

Econo-Rack Group Ltd.
2655 North Sheridan Way, Suite 230
Mississauga, Ontario
L5K 2P8

2. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Ontario Building Code and are not subject to mezzanine or interconnected floor space rules.

3. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

4. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Ontario Building Code. Reports reviewed by the Commission include:

Reports on Consolidated Authorization (October 17th, 2000 and January 11, 2001) - Larden Muniak Consulting Inc.

5. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for the ECONO-RACK GROUP LTD. Shelf and Rack Storage System as manufactured and marketed by:

ECONO-RACK STORAGE EQUIPMENT LTD.
1770 Britannia Road East
Mississauga, Ontario
L4W 1J3

PACIFIC WESTEEL RACKING INC
3191 Mainway
Burlington, Ontario
L7M 1A6

INTERNATIONAL STORAGE SYSTEMS
6200 Dixie Road, Unit 102
Mississauga, Ontario, L5T 2E1

* GLOBAL STORAGE SYSTEMS INC.
3556 Lakeshore Road
Blasdell, New York 14219

* ENRACK SYSTEMS INC.
132 Adams Road
Branford, Ontario
N3S 7V2

* KONSTANT PRODUCTS
5300 Golf Road
Skokie, IL
60077

ALLTYPE STORAGE SYSTEMS INC
349 Arvin Ave.
Stoney Creek, Ontario
L8E 2M6

AMRACK EQUIPMENT LTD
3101 Hawhorne Road
Ottawa, Ontario
K1G 3V8

* WAREHOUSE SYSTEMS INC.
701 Millway Avuenue,
Unit #3, 4, 5
Vaughan, Ontario
L4K 3S7

* LC DYNAMIX INC.
2295 Dunwin Drive, Unit #4 and 5
Mississauga, Ontario
L5L 3S4

1.2 This Authorization is the successor of:

BMEC Authorization # 95-08-193 held by PACIFIC WESTEEL RACKING INC.;
BMEC Authorization # 90-08-136 held by PACIFIC WESTEEL RACKING INC.;
BMEC Authorization # 96-03-202 held by ALTYPE METAL STAMPINGS LTD.
BMEC Authorization # 90-02-130 held by ALTYPE METAL STAMPINGS LTD.
BMEC Authorization # 90-08-139 held by ENRACK SYSTEMS INC.
BMEC Authorization # 95-02-187 held by ENRACK SYSTEMS INC., INTERNATIONAL STORAGE SYSTEMS INC. and ECONO-RACK STORAGE EQUIPMENT LTD.;
BMEC Authorization # 01-02-254 held by ECONO-RACK STORAGE EQUIPMENT LTD.;
BMEC Authorization # 01-03-255 held by AUTOSTAK SYSTEMS CANADA.

Use and Occupancy

2.1 Except where more restrictively provided in paragraph A 3.4. below, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III, and IV commodities, Group A, B, C plastics and rubber tires as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions. Where the shelf and rack storage system incorporate the storage of rubber tires, such storage shall conform to the requirements to Subsection 3.3.1. “Indoor Tire Storage” of the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Ontario Building Code, as amended or remade from time to time.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be designed in accordance with Part 4 of the Ontario Building Code as amended or remade from time to time.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) (i) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(ii) open construction consisting of steel grating or open steel floor planking,

(b) deck and walkway levels in structures used for the storage of Group A, B and C plastic, as defined in NFPA 13-1999, and rubber tires, shall be constructed of steel decking as required in (a) above.

3.4. The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system, supporting Class I, II, III, and IV commodities, Group A, B, C plastics and rubber tires as defined in NFPA 13-1999 shall not exceed 7 m.

3.5 Lighting levels of walkways and platforms shall conform to the Ontario Building Code, as amended or remade from time to time.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2) and 3.2.7.4.(1) respectively of the Ontario Building Code, as amended or remade from time to time.

3.7 Guards and toe boards shall be installed in accordance with the Ontario Building Code, as amended or remade from time to time.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs A 4.3 and A 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the self and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph A 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 - 1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Ontario Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Ontario Building Code as amended, except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than two levels; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m :

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Ontario Building Code, using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time

(b) the Total Egress Time shall be calculated using the following formula;

$$\textit{Total Egress Time} = (H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5 \textit{ (in seconds)}$$

where:
H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Ontario Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Ontario Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a "positive lock" when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

5.8 Where 'at-level' conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two 'at-level' conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the 'at-level' cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each 'at-level' conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the 'at-level' cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each 'at-level' cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 5. A. above; or

(b) the occurrence of any of the events described in Sections 5. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1 of this Authorization; or,

(iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section 5 A 1.1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 5. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 27th day of November 2003.

AUTHORIZATION REPORT – Shelf And Rack Storage System

1. Applicant

North American Steel Equipment
Company Ltd.
300 Hopkins Street
Whitby, Ontario, L1N 2B9

Tel: 905 668-3300
Fax: 905 668-5477
Web: www.northamericansteel.ca

2. Manufacturing

North American Steel
Company Ltd.
300 Hopkins Street
Whitby, Ontario, L1N 2B9

3. Description

The North American Steel Equipment Company Ltd. (North American Steel) shelf and rack storage system (the "shelf and rack storage system") is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment.

Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Building Code, as amended or remade from time to time and are not subject to mezzanine or interconnected floor space rules.

4. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

5. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Building Code.

6. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for North American Steel Equipment Company Ltd.

Use and Occupancy

2.1 Except as where more restrictively provided for in 3.4 and 3.5 of this authorization, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions; where the shelf and storage system incorporates the storage of rubber tires, such storage shall conform to the requirements of Subsection 3.3.1. “Indoor Tire Storage” of the Ontario Fire Code, Ontario Regulation 338/97, as amended or remade from time to time (the “OFC”),

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Building Code.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the OFC.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be of noncombustible construction, and be designed in accordance with Part 4 of the Building Code.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act* (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) (i) solid construction consisting of steel plate or steel decking with a top substrate that forms a serviceable floor area, or

(ii) open construction consisting of steel grating or open steel floor planking.

(b) Deck and walkway levels in a structure used for the storage of Group A, B, and C plastic, as defined in NFPA 13-1999, and rubber tires, shall be constructed of steel decking as required in (a) (i) above.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Class I, II, III and IV commodities as defined in NFPA 13 -1999 as amended.

3.5 Where Class I, II, III and IV commodities and Group A, B, C, plastics and rubber tires as defined in NFPA 13-1999 are stored, the maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 7 m.

3.6 Lighting levels of walkways and platforms shall conform to the Building Code.

3.7 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2). and 3.2.7.4.(1). respectively of the Building Code.

3.8 Guards and toe boards shall be installed in accordance with the Building Code.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;

(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;

(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;

(e) a significant change in water level in any water storage container used for fire fighting purposes;

(f) loss of electrical power to any automatically starting electrical fire pump; and,

(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA 71-1998, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA 72-1990, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the shelf and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall be permanently mounted at or near the sprinkler control valve and shall describe:

(a) the Commodity Class applicable and as referenced in paragraph 2.1, and

(b) the sprinkler design criteria used for each shelf and rack storage system.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 -1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the OFC.

4.10. Regardless of the occupant load, the requirements of Section 2.8 “Emergency Planning” of the OFC shall apply.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Building Code except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m^2 in area;

(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,

(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m:

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a “time-based egress analysis” undertaken and sealed by a Professional Engineer or Architect as defined in the Building Code using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal

along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time.

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

Where: H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm. This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a “positive lock” when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the Fire Safety Plan, as required by 4.10. of this Authorization, shall mark the lift gates such that they are readily identifiable as part of the egress route.

5.8 Where ‘at-level’ conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two ‘at-level’ conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the ‘at-level’ cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the ‘at-level’ cross-over and all inserts shall be sized to support loads required in Part 4 of the Building Code,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each ‘at-level’ cross-over, and

(e) stairs approaching ‘at-level’ conveyor cross-overs shall be marked in accordance with the Fire Safety Plan, as required by 4.10 of this Authorization, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the North American Steel Equipment Company Ltd shelf and rack storage system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time (BCA) and, except as specifically authorized herein, with the Building Code.
2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in Section A. above; or
   (b) the occurrence of any of the events described in Sections B. 4. (a) and (b) (ii) below;

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this authorization; or,

      (iii) the ownership of the Applicant specified in Section 1 or of the companies specified in Section A 1.1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the BCA or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section A. above; or

   (d) any Building Code provision relevant to this authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 27 day of July 2006.

BMEC APPLICATION # **BMEC # A2001- 13**

TYCO FIRE PRODUCTS
CENTRAL MODEL WS WINDOW SPRINKLER

1. Applicant

Tyco Fire Products
1467 Elmwood Avenue
Cranston, Rhode Island
USA 02910

Tel: (401) 781-8220
Fax: (401) 781-8868

2. Manufacturing Facilities

Tyco Fire Products
451 North Cannon Avenue
Lansdale, Pennsylvania
USA 19446

3. Description

The Central Model WS Window Sprinkler system is a sprinkler-protected window system consisting of a window assembly and a sprinkler system designed to protect the window assembly by spraying water on the glazing. The window assembly consists of fixed non operable glazing installed in metal frames. The glazing may incorporate vertical mullions or butt joints without mullions. Windows assemblies with horizontal mullions are not eligible for sprinkler protection. Maximum dimension of sprinkler-protected window assemblies, along with details of the frames and glazing materials to be used, are indicated in individual listings.

4. Authorization Requested

The applicant sought authorization for the use of Central Model WS Window Sprinkler system manufactured by Tyco Fire Products as a 2 hour fire resistance rating equivalent to the level of performance required in Subsection 3.1.7. of the 1997 Ontario Building Code (OBC) as amended.

5. Assessment

Reports, assessments and information provided by the applicant indicate that if the Central Model WS Window Sprinkler system is designed and installed in accordance with the manufacturer's instructions and limitations; the Underwriters Laboratories of Canada Listing, ULC/ORD-C263.1-99; and the Specific Terms and Conditions stated in this Authorization, then the level of performance required by the OBC will be provided.

Reports, assessments and information reviewed included the following:

1. Canadian Construction Materials Centre (CCMC), Evaluation Report 12752-R: Issued 24 June 1996, Revised 07 January 1997.

2. Ruling of The Minster of Municipal Affairs and Housing: No. 97-01-49(12572)R.

3. Manufacturer's information Central WS 3-0: Model WS™ Specific Application Window Sprinklers™.

4. Underwriters Laboratories Inc. File Ex683, project 95NK26512, dated 07 February 1996, "Report on Automatic Sprinklers, Central Sprinklers Corp., Lansdale, Pennsylvania."

5. Underwriters Laboratories Inc. File Ex683, project 94NK27353, dated 22 August 1995, "Report on Special Service Investigation on Automatic Sprinklers Used on Windows, for Central Sprinklers Corp., Lansdale, Pennsylvania."

6. Underwriters Laboratories of Canada listed classification titled " Window Sprinklers" Guide No. 2257.

7. Underwriters Laboratories of Canada, certification Bulletin No. 99-33, dated 25 October 1999.

8. Underwriters Laboratories of Canada, ULC/ORD-C263.1-99 "Window - Protected Window Systems". First Edition October 1999.

9. Technical Background Information (TBI) Memo relating to Central Model WS Window Sprinkler system dated 27 June 2001.

6. Authorization

The Central Model WS Window Sprinkler system is authorized subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. This authorization is valid only for Central Model WS Window Sprinkler system.

2. The design and general review of the Central Model WS Window Sprinkler system shall be in accordance with ULC/ORD-C263.1-99, Appendix A, Installation Guidelines.

3. The design and general review of the Central Model WS Window Sprinkler system shall be carried out by a Professional Engineer as defined in the *Professional Engineers Act*, (Ontario). The Professional Engineer shall provide the chief building official with a document certifying that the installation conforms with this authorization.

4. The Central Model WS Window Sprinkler system shall incorporate ULC Listed sprinkler heads: model WS 3-01, 5.6 K-factor - Quick Response, SIN C3388 - Horizontal Sidewall and SIN C3488 Pendant Vertical Sidewall.

5. The Central Model WS Window Sprinkler system shall not be used in a fire wall.

6. The Central Model WS Window Sprinkler system shall not be used in High Hazard Industrial Occupancies, Group F, Division 1.

7. The Central Model WS Window Sprinkler system shall not be used on any part of an exit serving a floor area subject to the requirements of OBC Subsection 3.2.6.

8. The Central Model WS Window Sprinkler system shall not be used on any part of an exit serving Care and Detention Occupancies, Group B; or Residential Occupancies, Group C.

9. Where the Central Model WS Window Sprinkler system is used to provide fire-resistance rating of exit fire separations:

    (a) the building shall be sprinklered, and

    (b) the exits with a Central Model WS Window Sprinkler system shall not comprise more than one half of the required number of exits from any floor area.

B. GENERAL CONDITIONS

1. The use of the Central Model WS Window Sprinkler system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the Specific Terms and Conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Specific Terms and Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this authorization;

      (ii) the address of the applicant specified in Part 1 of this authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the applicant, or the material, system or building design that is the subject matter of this authorization, has failed to comply with any of the Specific Terms and Conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

BMEC APPLICATION **# A 2001-07**

ROYAL GROUP TECHNOLIGIES LIMITED
Vinyl Deck Railing System ™

1. Applicant

Royal Group Technologies Ltd
1 Royal Gate Boulevard
Woodbridge, Ontario
L4L 8Z7

Tel: (905) 264-0698
Fax: (905) 264-0699

2. Manufacturing Facilities

Prince Plastics Limited
5770 Highway #7
Woodbridge, Ontario
L4L 3A2

3. Description

The Royal Vinyl Deck Railing System™ is composed of extruded PVC posts, rails and pickets. The posts and rails are PVC extrusions, reinforced with galvanized cold-formed steel. The posts are bolted to the existing deck substructure. The assembled railing section is fastened to the posts. The extruded components are available in white or tan.

4. Authorization Requested

The applicant sought authorization for the use of the Royal Vinyl Deck Railing System™, an innovative railing material for exterior applications, for surfaces that are not greater than 1 800 mm above the finished grade, as required by Sentence 9.8.8.2.(2) and as required by Article 9.8.8.8 “Construction of Guards” of the Ontario Building Code (OBC).

5. Assessment

Reports and assessments provided by the applicant show that if the Royal Vinyl Deck Railing System™ is designed, performance tested and maintained in accordance with the limitations the manufacturer's instructions and conditions stated in this authorization, the level of the performance required by Article 9.8.8.8 “Construction of Guards” of the OBC will be provided.

Reports and Assessments reviewed included the following:

1. Prince Plastics Limited: Quality Procedure Manual, “Section 10.0 Inspection and Testing.”

2. Royal Plastics Inc.: “Technical Data Sheet, Royal 8007/8100 Compounds.”

3. Prince Plastic Limited: “Quality Procedure Manual, Section 10.0 Inspection and Testing.”

4. Prince Plastic Limited: “Quality Procedure Manual, Section 13.0 Control of Nonconforming Products.”

5. Royal Outdoor Products: “Vinyl Deck Stair Railing Kit Assembly Instructions.”

6. Royal Outdoor Products: “Vinyl Deck Railing Kit Assembly Instructions.”

7. Ortech Corporation: Evaluation of the “Royal Deck” System.

8. Technical Background Information Memo relating to Royal Vinyl Deck Railing System ™ dated 29 March 2001.

9. Bodycote Materials Testing Ortech Laboratories: Evaluation of Railing Systems. Report No. 99-06-M174.

10. BOCA International Evaluation Report: Research Report 96.64. Evaluation Subject: Brock Deck™ and Triple Crown Fence.

6. Authorization

The Royal Vinyl Deck Railing System ™ is authorized for use as an exterior rail subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. This Authorization is valid only for the Royal Vinyl Deck Railing System™ and does not include the Royal Vinyl Deck System.

2. This authorization is valid only for Royal Vinyl Deck Railing System™ for buildings constructed under Part 9 of the Ontario Building Code.

3. The railing system shall not be used for surfaces that are greater than 1800 mm above the finished grade.

4. The railing system shall be attached to a deck structure as recommended by the manufacturer and shall be designed in conformance with Part 9 of the OBC.

5. The PVC incorporated in the railing system shall meet ASTM G26.

B. General Conditions

1. The use of the Royal Vinyl Deck Railing System ™ shall comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

DURAKIT SHELTERS INC.
Corrugated Fibreboard Building Envelope System

1. Applicant

DuraKit Shelters Inc.
2785 Hwy 27
P.O. Box 200
Bond Head, Ontario
L0G 1B0

Tel: (905) 953 - 8976
Fax: (905) 953 - 8945

2. Manufacturing Facilities

DuraKit Shelters Inc.
2785 Hwy 27
P.O. Box 200
Bond Head, Ontario
L0G 1B0

3. Description

The DuraKit Shelters Inc. corrugated fibreboard building envelope system, is a high strength corrugated structural fibreboard and building envelope system.

4. Authorization Requested

The applicant sought authorization for the use of the DuraKit Shelters Inc. corrugated fibreboard building envelope system as a wall and roof assembly system acceptable under Section 9.4 "Structural Requirements" of the 1997 Ontario Building Code as amended.

5. Assessment

Reports and assessments provided by the applicant indicate that if the DuraKit Shelter structural fibreboard and building envelope system is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations, and the specific terms and conditions stated in this authorization, the level of performance required by the Ontario Building Code will be provided.

Reports, assessments and information reviewed included the following:

1. "Full Scale Testing of DuraKit Shelter Subjected to Static- Equivalent Wind Loads" testing and report by the University of Western Ontario.

2. "Load Criteria, Material Testing and Component testing of DuraKit Shelter" testing and report by the University of Western Ontario.

3. "Finite Element Analysis of DuraKit Shelter" testing and report by the University of Western Ontario.

4. "A Study of Material Properties a Triple Corrugated Board" testing and report by the University of Western Ontario.

5. Compressive Test: Testing by Norampac Testing and Technical Services of Toronto, Ontario.

6. "Water Penetration" ASTM E 457-86: Testing by Bodycote Ortech.

7. "Air Leakage" ASTM E 283-91: Testing by Bodycote Ortech.

8. "Water Vapour Transmission" ASTM E 96-00: Testing by Bodycote Ortech.

9. "Surface Burning Characteristics of Fire Retardant Coatings" ULC-CAN-S102-M88 and UL 723: Testing by underwriters' Laboratory of Canada - interior finish only.

10. "Surface Burning Characteristics of Coated Paperboard Panel" ASTM E 84: Testing performed by Bodycote Ortech.

11. Performance Tests Conducted on One Vertical Sliding Window S-3450/4450 Series" CAN/CSA A440-M90: Testing by AIRS-INS.

12. "Door Test" CAN/CGSB-82.5-M88: testing and report by Inchcape Testing Services / Warnock Hersey.

13. "Impact Testing on an Entrance Door" ASTM F476-8: testing and report by Inchcape Testing Services.

14. "Water Vapour Transmission" ASTM E 96-94: Testing performed by Bodycote Ortech.

15. Sealant/Joints CAN/CGSB-19.13-M87.

16. "Full Scale Dynamic Testing of DuraKit Cardboard Shelter Using A Shake Table Device" testing and report by the University of Western Ontario.

17. Site visit: 01 June 2001.

18. Installation video tapes: "The Instant House" duration 10 minutes, and "The Instant House" duration 12 minutes.

6. Authorization

The DuraKit Shelters Inc. is a high strength corrugated structural fibreboard and building envelope system. The system may be used for wall and roof assemblies as described under Section 9.4 "Structural Requirements" of the 1997 Ontario Building Code. All other requirements pertaining to the construction of the DuraKit shelter shall conform to the requirements of the 1997 Ontario Building Code as amended, and subject to the following terms and conditions.

A. SPECIFIC TERMS AND CONDITIONS:

1. This authorization is valid only for DuraKit Shelter Inc.

2. This authorization is valid only for this tested model:

    a. Model name: 16' x 20' Test House Layout, 21 June 2001
    Model size: 4.9 m x 6.0 m (16' x 20')
    Total number of windows: three (3)
    Window size: 600 x 900 mm (24" x 36")
    Total number of doors: one (1)
    Door size: 800 x 2030 mm (32" x 80")
    Window/door configuration: One opening per side

3. The design and general review of the floor wall connection shall be carried out by a Professional Engineer as defined in the Professional Engineers Act, (Ontario). The Professional Engineer shall provide the chief building official with a document certifying that the installation conforms with this authorization.

4. The DuraKit shelter shall not be assembled, installed or located in areas where the ground snow load exceeds 2.25 kPa as per Sentence 2.5.1.1.(1) and Table 2.5.1.1. Column 10. To calculate the roof loading limitations, multiply the ground snow load by 0.8 and add a minimum rain load of 0.4 kPa.

5. The DuraKit shelter shall be assembled and installed as per the "Instant House" Installation Manual dated May 2001.

6. The DuraKit shelter shall be installed and assembled as per the "Instant House" Quality Control Manual dated January 2001.

7. The high strength corrugated fibre board used to construct the DuraKit shelters shall be provided by Norampac.

8. The Norampac high strength fibre board shall be (Grammage is a measurement

of weight in pounds per 1000 sq.ft. of paper) :

a.	Exterior	Grammage (lbs) 90 26 69 26 69 26 90 Flute Size A A C
b.	Interior	Grammage (lbs) 90 26 69 26 69 26 42/42 10 oz Poly Layer Between the 42/42 Layer Flute Size A A C
c.	Stud	Grammage (lbs) 69 26 69 Flute Size C

9. The maximum corrugated fibre board panel size permitted is:
   a. 1.2 m x 2.4 m for standard wall sections, and
   b. 520 mm (short leaf) x 600 mm (long leaf) x 2 400 mm for corner sections.

10. Sealants used in the installation and assembly of the DuraKit shelter must be Spectrem® 1 Ultra Low Modulus Silicone Joint Sealant conforming to CAN/CGSB-19.13-M87.

11. Windows installed in the DuraKit high strength corrugated structural fibreboard shall be:
   a. limited to one per 1 200 mm panel,
   b. a minimum dimension of 300 mm from the intersection of the ceiling,
   c. centred on the 1 200 mm panel, having a minimum of 220 mm from the edge of the 1 200 mm panel.
   d. incorporate a 38 x 89 mm wood frame, and
   e. located as per the size and configurations set out in Specific Terms and Conditions # 2 of this authorization.

12. Doors installed in the DuraKit high strength corrugated structural fibreboard shall be:
   a. limited to one per 1 200 mm panel,
   b. a minimum dimension of 300 mm from the intersection of the ceiling,
   d. centred on the 1 200 mm panel,
   e. incorporate a 38 x 89 mm wood frame, and
   f. located as per the size and configurations set out in Specific Terms and Conditions # 2 of this authorization.

13. A 38 x 89 mm wood top plate shall be installed around the perimeter of the panels.

14. 38 x 89 mm wood framing members must be installed 1200 mm o.c. at the connection of every 1200 mm panel.

15. The Durakit panel joints and the interlocking top and bottom track shall be staggered. The joint cap base shall not be located where two wall panels

intersect along the same plane.

16. Electrical devices such as, but not limited to smoke alarms, outlets, receptacles, switches and fixtures shall be surface mounted on the high strength corrugated structural fibreboard system and be reinforced as required.

17. Additional loads such as, but not limited to shelves, cabinets, and fans which may be located on the walls, roofs and ceilings that the system has not been designed or tested for shall have reinforcements added which comply with the requirements of the 1997 Ontario Building Code as amended.

18. Only DuraKit authorized personnel shall install and assemble the system.

19. Individuals/ installers must have completed the following requirements to be considered DuraKit authorized personnel:
    a. undergo "On Site" training and supervision sessions from DuraKit authorized personnel,
    b. successfully install and assemble two complete units, and
    c. be listed with DuraKit Shelters Inc. as authorized personnel.

B. GENERAL CONDITIONS

1. The use of the DuraKit shelter system must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.

2. A copy of this authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The applicant named in Part 1 hereof shall promptly notify the BMEC of:

    (a) the failure of the applicant, or of the material, system or building design that is the subject matter of this authorization, to comply with any of the terms and conditions set out in 6. A. above; or

    (b) the occurrence of any of the events described in Conditions 6. B. 4. below.

4. The BMEC may amend or revoke this authorization where it determines that:

    (a) any change has been made to:

        (i) the material, system or building design that is the subject matter of this Authorization;

        (ii) the address of the applicant specified in Part 1 of this

Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the applicant, or the material, system or building design that is the subject matter of this authorization, has failed to comply with any of the terms and conditions set out in this authorization; or

(d) any Ontario Building Code provision relevant to this authorization has been amended or remade.

AUTHORIZATION REPORT – The Whitewater Area Bed System

1. Applicant

Delta Environmental Products
P.O. Box 969
Denham Springs, LA
USA, 70727

Tel: 800 219-9183
Fax: 225 664-9467

2. Manufacturing

Delta Environmental Products, Inc.
8285 Florida Blvd
Denham Springs, LA, USA, 70726

Canwest Tanks & Ecological Systems.
11975 Old Yale Road Surrey
BC, V3W 3X4

3. Description

The Whitewater Area Bed System primarily consists of a pre-treatment tank, a tertiary treatment unit, an effluent filter and an area bed.

Delta Environmental Products Inc.'s tertiary treatment units permitted for use with this system are referenced in the Supplementary Guidelines to the Building Code, as amended, as meeting tertiary quality effluent criteria, and include models FD 50 FF, DF 60 FF, DF 75 FF, DF 100 FF, DF 150 FF and DF 150 x 2.

An effluent filter is required downstream of the treatment unit. The specification of the effluent filter may vary depending on the area bed system design, and the filter models permitted for use with this Area Bed are located in Section 4.1. of this authorization.

The area bed is comprised of two parts: the stone layer and the sand layer. The sand layer of an area bed is sized in consideration of the soil it rests on, and under certain conditions it may be required to be laterally extended. This lateral sand extension is known as the mantle.

The effluent is sent to the stone layer, either by gravity or by a pump, via a pipe. This pipe leads from the treatment unit and terminates at the distribution box or header. From the distribution box or header, the effluent is sent to a series of perforated distribution pipes that run through the stone layer.

4. Authorization Requested

The applicant seeks to have the Whitewater Area Bed System, which incorporates a treatment unit designed so that the effluent meets the tertiary effluent quality criteria referenced in Table 8.6.2.2.A. of the Building Code, authorized for use as a Class 4 System that is connected to an absorption system other than the leaching bed as referred to in Article 8.6.1.2. of the Building Code.

5. Assessment

Reports and assessment provided by the applicant demonstrate that if the Whitewater Area Bed System is constructed, installed, operated, maintained and monitored in accordance with the limitations of the manufacturer specifications and conditions stated in this authorization, a level of performance equivalent to that required of a class 4 sewage systems will be provided.

The following reports were submitted and reviewed are:

1. Whitewater Systems Owners Manual, Models DF 50, DF 60, DF 75, DF100 or DF 150.

2. Technical Background Information Memo relating to Canwest Tanks & Ecological Systems dated September 18, 2000.

3. CAN/CSA-B66-00 - Prefabricated Septic Tanks and Sewage Holding Tanks, Plumbing Products and Materials - a National Standard of Canada.

4. Operations, Specifications & Test Data on the Free Access Sand Filter - July 1999, including a February 16, 1998, NSF International Report on the Delta Environmental Products Inc. DF-40M and Free Access Sand Filter. Tested under the provisions of ANSI/NSF Standard 40.

5. The “Supplemental (Canadian Version) Owner’s / Operator’s Manual” dated September 1999, which incorporates a schedule of required maintenance to be conducted on the system every six (6), twelve (12) and twenty four (24) months.

6. NSF International Report on the evaluation of Delta products Inc., model DF 40- Wastewater Treatment System.

7. Whitewater Installation Operation and Maintenance Manuals.

8. Whitewater Service / Maintenance Agreement.

9. Whitewater Inspection Work Order.

10. Whitewater Treatment Units Pre-treatment Sizes, dated July 17, 2006.

11. Sample Drawings, Gunnell Engineering Ltd, dated July 7, 2006.

6. Authorization

A. The Area Bed System is authorized as an equivalent to other Class 4 sewage systems as referenced to in Section 8.7. “Leaching Beds” of the Building Code; all other requirements pertaining to the design, installation and construction are subject to the regulations of the Building Code, and to the following terms and conditions.

1.0. Definitions

A word or phase used in this Authorization has the following meaning for the purposes of this Authorization:

Area Bed means the part of a leaching bed comprised of a stone layer and the underlying unsaturated sand layer intended to further treat and distribute the effluent, and does not include the area referred to as the mantle.

Contact Area means the area of infiltrative surface, directly below the area bed, required to absorb the treated effluent into the underlying native soil, but does not include the area where the mantle, if required, comes into contact with the native soil.

Extended Contact Area means the area of the sand bed, as extended, and mantle, where required, to meet the necessary lateral extension such that the effluent is absorbed into the underlying soil

Infiltrative Surface means the area of interface where effluent migrates downward from the sand layer of the area bed and, if necessary, the mantle and passes into the native soil or leaching bed fill.

Mantle means the lateral extension of the area bed using imported leaching bed fill having a T time of 15 min/cm or less, but does not include the area referred to as the area bed, necessary to provide an area of hydraulic catchments in any direction in which the effluent entering the leaching bed fill will move horizontally such that effluent is treated and absorbed.

Raised or Partially Raised Area Bed means a sewage system in which any part of the area bed is above the natural ground elevation.

Uniform Distribution means the even dispersal of effluent throughout all areas of an area bed and adjoining mantle, if required, as it migrates down from the stone layer to the underlying sand layer to either the native soil or mantle comprised of imported soil.

Vertical Separation means the depth of unsaturated soil below a leaching bed as measured from the bottom of the absorption trench or the bottom of the stone layer to a limiting surface such as high ground water table, rock or soil with a percolation time greater than 50 min/cm.

2.0 Installation Requirements

2.1. This Authorization is valid only for Delta Environmental Products Inc.

2.2. Only Delta Environmental Products Inc. manufacturer trained and authorized agents or employees shall install, maintain and service the area bed system.

2.3. The Area Bed System shall be installed as per the manufacturer's installation instructions.

2.4. The Service and Maintenance Agreement prescribed by Sentence 8.9.2.3.(2) of the Building Code requires that the persons authorized by the manufacturer to service and maintain Area Bed System and who have entered into the agreement with the person operating the treatment unit, and shall:

2.4.1. conduct and record at least once during every twelve month period, an inspection and servicing as specified by the manufacturer of the Delta treatment unit, and provide a copy to the person operating the Area Bed System;

2.4.2. provide a copy of the Delta Environmental Products operation and maintenance manual revised, to the person operating the Area Bed System and to the authority having jurisdiction at the time of the permit application;

2.4.3. conduct sampling and testing in accordance with the requirements of Clauses 8.9.2.4.(1)(a) and (b) of the Building Code;

2.4.3.1. once during the first 12 months after the Area Bed is put into use, and

2.4.3.2. thereafter, once during every 48 month period after the previous sampling has been completed.

2.4.4. promptly submit the sampling test results to the person operating the Area Bed System.

2.5. Delta Environmental Products Inc. shall retain records of the sampling test results for each Area Bed System received pursuant to the terms and conditions set out in 2.4. above, for a period of 10 years and shall promptly forward copies of those records to a chief building official upon request.

3.0 System Requirements

3.1. All pipe connections in the system (i.e. treatment units, accessory treatment units, tanks, pumps and filters) where incorporated, shall be flexible and watertight.

3.2. The Delta Environmental Products Inc. treatment units used in the system shall use the daily design flows as referenced in Table 3.2.1. "Daily Design Flow",

Table 3.2.1.
Daily Design Flow

Treatment Unit Models	**Flow Range** measured in Litres	**Minimum Pre-treatment Tank Size** measured in Litres
DF 50	850 to 1900	1140
DF 60	1900 to 2300	1140
DF 75	2300 to 2900	1360
DF 100	2900 to 3800	1810
DF 150	3800 to 5700	3400
DF 150 x 2	5700 to 10 000	6800
Column 1	Column 2	Column 3

4.0. Design

4.1. The Area Bed System treatment units shall be fitted with an a bottomless sand filter or a BK-2000 filter, except

4.1.1. where the distribution of the effluent to the area bed is pressurized, GAG Sim/Tech 100 micron pressure filter, model number STF-100 and STF-100AZ, or a 100 micron Vortex filter shall be used.

4.2. An absorption system comprised of a stone layer overlying a sand layer and having a total minimum depth of 500 mm, and:

4.2.1. the stone layer shall be a minimum depth of 200 mm, and

4.2.2. the sand layer shall be a minimum depth of 250 mm and have a percolation time of 6 to10 min/cm.

4.3. The stone layer required by 4.2. above, shall have a minimum area as specified by the manufacturer but not less than:

4.3.1. where the total daily design sanitary sewage flow does not exceed 3000 L, the area shall be such that the loading on the surface of the stone layer does not exceed 75 L/m² per day, or

4.3.2. where the total daily design sanitary sewage flow exceeds 3000 L, the area shall be such that the loading on the surface of the stone layer does not exceed 50 L/m² per day.

4.4. The stone layer shall be rectangular in shape, with the long dimension parallel to the site contours.

4.5. The stone layer required by the terms and conditions set out in 4.2. above, shall be protected with a permeable geo-textile fabric in such a manner so as to prevent soil or leaching bed fill from entering the stone.

4.6. The bottom of the stone layer shall be at all points vertically separated at least 600 mm from the high ground water table, rock or soil with a T time of 6 or less, or greater than 50 min/cm; except:

4.6.1. where the underlying soil has a T time of between 6 and 50 min/cm, the bottom of the stone layer at all points may be reduced to 450 mm to rock, high water table, and soil having a T time of 50 min/cm.

4.7. The effluent shall be evenly distributed over the stone layer to within 600 mm of the perimeter edge of the stone layer using distribution pipes in accordance with the Building Code Appendix A-8.7.5.3.(2); or other means that achieves even distribution to within 600 mm of the perimeter edge of the stone layer.

4.8. The sand layer shall have a minimum area that is the greater of;

4.8.1. the area of the stone layer required by the terms and conditions set out in 4.4. above,

4.8.2. where the sand layer is installed in soil having a T time of 15 min/cm or less, the loading rate at the base of the area bed, shall be calculated using the formula A = QT/850 (L/m^2/day), or

4.8.3. where the sand layer is installed in or on soil having a T time of greater than 15 min/cm, that the sand layer be extended using imported leaching bed fill having a T time of not more than 15 min/cm, the construction of the extended sand layer, including the area bed and mantle shall:

4.8.3.1. be of a depth of at least 250 mm,

4.8.3.2. extend at least 15 m beyond the perimeter of the treatment unit, or distribution pipes if utilized, in any direction that the effluent entering the soil will move horizontally,

4.8.3.3. be calculated using the formula A = QT/400 or by using the example calculations as they are provided, in Table 4.8.3.3. "Combined Area Bed and Mantle Loading Rates", and

4.8.3.4. be rectangular in shape.

Where:

A is the area of contact in m^2 between the base of the sand layer and the underlying native soil,
Q is the total daily design sanitary sewage flow in litres, and
T is the percolation time of the underlying native soil in min/cm to a maximum of 50.

Table 4.8.3.3.

Combined Area Bed and Mantle Loading Rates Example Calculations

Loading Rate A = QT/400	
T of the native soil.	Loading rate ($L/m^2/day$)
≤ 15	27
20	20
30	13
40	10
≥50	8
Column 1	Column 2

4.9. Any Area Bed System that must be raised to meet the vertical separation distances required by the terms and conditions set out in 4.6. of this Authorization, shall meet the mantle requirements of the terms and conditions set out in 4.8., regardless of the T time of the native soil.

B.General Conditions

1. The use of the Area Bed System and as described in the specific terms and conditions set out in 6.A. must comply with the *Building Code Act, 1992* (the "Act") as amended or re-enacted from time to time and except as specifically authorized herein, with the Building Code.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6.A. above; or

   (b) the occurrence of any of the events described in conditions 6.B.4.(a) and (b)(ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the Act any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

5. Where the BMEC receives additional information concerning the material, system or building design authorized herein, the BMEC may review this Authorization and the BMEC may after the review amend or revoke this Authorization as in the opinion of the BMEC may be necessary.

Dated at Toronto this 27 day of July 2006.

OATEY CANADA INC. SURE-VENT® AND SURE-VENT II® AIR ADMITTANCE VALVE

1. Applicant

2. Manufacturing Facilities

Oatey Canada 218 Wilkinson Road, Unit 3 Brampton, Ontario L6T 4M4

Tel: (905) 451-1312
Fax: (905) 451-1314

3. Description

Cherne Industries Inc. 5700 Lincoln Drive Minneapolis , MN 55436 Oatey Canada Inc. Sure-Vent® and Sure-Vent II®, Air Admittance Valve (AAV) is intended for use as an alternative measure to a vent pipe that extends to the open air. These valves open under a negative pressure within the drainage system allowing air to enter the venting system to maintain trap seals. The valves close by gravity under no pressure differential (no flow) or under positive pressure to prevent the leakage of sewer gases through the valve. The Oatey AAV Sure-Vent® comes in two models: Model 39007 and Model 39009. The Oatey AAV Sure-Vent II® comes in five models: Model 39015,

Model 39016, 39017, Model 39018, and Model 39019.

4. Authorization Requested

The applicant sought authorization for the use of their product as an alternative to extending a vent pipe to open air as presently required by the OBC.

5. Assessment

Reports and assessments provided by the applicant show that if the Oatey Sure-Vent® and Sure-Vent II® are designed, performance tested and maintained in accordance with the limitations the manufacturer's instructions and conditions stated in this authorization, the level of the performance required by the OBC for individual venting, duel venting, wet venting or circuit venting for fixtures located on the same floor level will be provided.
Reports submitted and reviewed:

1. Oatey Canada Inc. Sure-Vent® and Sure-Vent II®, Air Admittance Valve, manufacturer's information.
2. Technical Background Information Memo (TBI) relating to Oatey Canada Inc. Sure-Vent® and Sure-Vent II® Air Admittance Valve dated 15 May 2001.
3. Alternative approval letter, Department of Commerce, State of Wisconsin dated 20 February 2001.
4. Approval Letter, Allegheny County Health Department, Pittsburgh, PA dated 31 January 2001.
5. National Listing, Sure-Vent® and Sure-Vent II® Models:

(a) NSF Plumbing and Related Products Listing NSF Standard 14 Directory to ANSI/ASSE 1051-96.

(b) IAPMO Classified Listing to ANSI/ASSE 1051-96, Uniform Plumbing Code Section 301.2.

(c) National Evaluation Service (NES) listing to NSF Standard 14 and ANSI/ASSE 1051-96. NES listing indicates compliance with the

1997 International Plumbing Code, with 1999 Accumulative Supplement, as referenced by the 1999 BOCA National Building Code and the CABO One and Two Family Dwelling Code.

(d) Southern Building Code Congress International (SBCCI) Public Safety Testing and Evaluation Services, Inc. listing to NSF Standard 14 and ANSI/ASSE 1051-96. Reference to CRT Laboratories Test Report No. 11836a-R1, indicating Sure-Vent® compliance to ASSE 1050-91, is also included within the text of the report.

6. ASSE 1050-91Compliance Documentation:

(a) ASSE Seal Control Board Certificates:
i. Sure-Vent® Original Certificate dated 11 November 1997, and
ii. Sure-Vent® Renewal Certificate dated 15 November 2000.

(b) Compliance Reports, Sure-Vent® models:
i. CRT Laboratories, report number 11836a-R1, and
ii. SGS US Testing Company Inc., report numbers TS97-0363-1R & 2R.
7. ANSI 1998 / ASSE 1996 1051, Compliance Documentation:

(a) ASSE Seal Control Board Certificates:
i. Sure-Vent® Original Certificate dated 11 November 1997,
ii. Sure-Vent® Renewal Certificate dated 15 November 2000, and
iii. Sure-Vent II® Original Certificate dated 13 June 2000.

(b) Compliance Reports, Sure-Vent® models:

i. CRT Laboratories, report number 11836a-R1,
ii. NSF International, project number NCO9441, and
iii. SGS US Testing Company Inc., report numbers TS97-0363-3R & 4R.

(c) Compliance Report, Sure-Vent II® models:

i. NSF International, project number 20330, and
ii. NSF International, project number 20333.

6. Authorization

The use of Oatey Sure-Vent®, size 2" (50 mm), and Sure-Vent II ®, sizes

1 ½" (38 mm) and 2" (50 mm), are authorized for use within a plumbing system as an alternative where there is no other means of connecting to the traditional venting system and where there is no danger of back pressure presenting a problem.

A. SPECIFIC TERMS AND CONDITIONS:

1. Vent system utilizing Oatey AAV shall conform to performance standards for "Fixture and Branch Air Admittance Valves" ANSI/ASSE 1051-90 (rev. 1996).
2. The PVC material used in the Oatey AAV shall conform to ASTM D2665-00.
3. The ABS material used in the Oatey AAV shall conform to ASTM D2661-97.
4. The Oatey AAV shall be installed in accordance with the manufacturer's installation instructions. In case of a conflict between the manufacturer's installation instructions and the OBC requirements, the provisions of the Code shall govern.
5. The manufacturer shall supply instructions on the proper and safe installation of the Oatey AAV. Such instructions shall include a reference requiring that the installation be made in accordance with the Specific Terms and Conditions listed in this BMEC Authorization. Such instructions shall include detail drawings and must remain on site.
6. The Oatey AAV shall be installed after the drain waste and vents (DWV)

have been tested as required by OBC Articles 7.3.6.4 and/or 7.3.6.5 and prior to the final test as required in Article 7.3.6.6. so as to establish that an adequate seal under positive pressure is achieved.

7. Individual, dual, wet and circuit vents shall be permitted to terminate with a connection to a Oatey AAV. When more than three fixtures connect to the horizontal branch a relief vent is required.
8. The Oatey AAV shall not be used on a vent stack or stack vent.
9. The Oatey AAV shall only vent fixtures that are located on the same floor level and connect to a horizontal branch line.
10. The horizontal branch drain shall connect to the building drain or the stack not more than 4 storeys (as defined in Part 7 of the OBC) from the top of the stack.
11. The horizontal branch that is circuit vented shall be provided with a relief vent that shall connect to a vent stack, stack vent, header or extend outdoors to open air.
12. The Oatey AAV's shall not be used as relief vents.
13. The relief vent shall connect to the horizontal branch drain between the stack or building drain and the most downstream fixture drain connected to the horizontal branch drain. The relief vent shall be sized in accordance with Article 7.5.2.2 of the OBC. The relief vent may be a wet vent if it is 2" (50 mm) size or greater and not more than one fixture having a maximum of 1½ fixture units is

drained into it.
14. The Oatey AAV shall be located 6" (150 mm) above the flood level rim of the fixture being vented where possible, and in case of a single fixture, as high as possible but not less than 4" (100 mm) above the weir of the fixture trap.
15. The Oatey AAV shall be located within the maximum developed length permitted as per Article 7.5.5.3 of the OBC.
16. The Oatey AAV shall be located in an area that is accessible for inspection, service, repair and/or replacement. For the purpose of this authorization, concealment in walls and/or floor spaces without removable grills or access panels is not considered accessible.
17. The Oatey AAV shall not be located in an attic space.
18. The Oatey AAV shall be located within a ventilated space that allows air to

enter the valve.

19. The Oatey AAV shall be rated for the size of the vent to which the valve is connected.
20. Each plumbing system shall have a minimum of one 3" (75 mm) stack which shall be extended outdoors to the open air as per Sentence 7.5.6.2.(2) of the OBC.
21. The Oatey AAV shall not be used for corrosive or acid waste systems, grease and oil interceptors installations or any other special waste systems.
22. The Oatey AAV shall not be used for any closed system such as a sewage ejector, or a manhole located inside the building.
23. The Oatey AAV shall not be located in spaces utilized as supply or return air plenums.
24. When the Oatey AAV is located in an area where freezing conditions may occur protection of the Oatey AAV shall be done in accordance with the manufacturer's installation instructions.
25. The Oatey AAV must be installed as close to true vertical as possible, but not more than 15^{o} off the true vertical.

8. General Conditions

1. The use of the Sure-Vent® and Sure-Vent II® must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the OBC as amended or remade from time to time.
2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.
3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

(a) the failure of the applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

(b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Part 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

DRIANGLE INC.
Architectural Moulding With a Foam Plastic Core

1. Applicant

Driangle Inc.
60 Wildcat Road
North York, Ontario
M3J 2V4

Tel: 416. 663. 4835
Fax: 416. 663. 9414

2. Manufacturing Facilities

Driangle Inc.
60 Wildcat Road
North York, Ontario
M3J 2V4

3. Description

The architectural moulding consists of a foam plastic core surfaced with a protective coating of **Fiberglas** mesh, the Driangle Inc. proprietary basecoat and the Driangle Inc. proprietary topcoat. These architectural mouldings come in various sizes and shapes, which are fastened in place with **Sheetrock 90** adhesive to the interior gypsum board surfaces.

4. Authorization Requested

The applicant sought Authorization for the use of the Driangle Inc. architectural moulding with a foam plastic core, as an equivalent to combustible millwork as permitted by Article 3.1.5.7. of the Ontario Building Code, for use in buildings required to be constructed of noncombustible construction.

5. Assessment

Reports, assessments and information provided by the applicant indicate that if the Driangle Inc. architectural moulding with a foam plastic core is designed, performance tested and installed in accordance with the manufacturer's instructions
and limitations and with the specific terms and conditions stated in this Authorization, the level of performance required by the Ontario Building Code will be provided.

Reports, assessments and information reviewed included the following:

1. ASTM E84, Standard Test Method for Surface Burning Characteristic of Building Materials.

2. ASTM E84, Test results from Underwriters' Laboratories of Canada, Standard Test Method for Surface Burning Characteristic of Building Materials.

3. UL 1715, Fire Test of Interior Finishes Material.

4. UL 1715, Test results from Underwriters' Laboratories of Canada, Fire Test of Interior Finishes Material.

5. BOCA Commentary 803.3.1. and BOCA 2603.9.

6. Video Tape: Driangle, Room Burn, 35456, C1019, 01 February 2001

6. Authorization

The Driangle Inc. architectural moulding with a foam plastic core is authorized subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. The architectural foam plastic moulding shall be limited to use as crown mouldings at ceilings and as chair rails on walls in buildings required to be constructed of noncombustible construction by Part 3 of the Ontario Building Code.

2. The architectural foam plastic moulding shall be fastened in place with **Sheetrock 90** adhesive to a gypsum board substrate finished in place. The gypsum board substrate shall be continuous behind the architectural foam plastic moulding.

3. Each moulding shall be surfaced on the exposed side with an application of **Fiberglas** mesh. The surfacing shall be applied as per the applicant's instructions, with the proprietary basecoat and the proprietary topcoat.

4. Individual mouldings may not be longer than 2440 mm. For longer lengths the mouldings are to be connected together with **Fiberglas** mesh tape and the proprietary joint compound. All corners and ends are to be treated with **Fiberglas** mesh and the proprietary joint compound, to maintain a continuous seal.

5. The mouldings shall not constitute more than 10% of the aggregate area of the wall and ceiling areas of a room or space in which they are installed. This area includes the area of doors and other openings in the walls. The trim shall be uniformly distributed throughout the room or space.

6. The mouldings shall be installed in accordance with the Driangle's Inc. installation instructions.

B. GENERAL CONDITIONS

1. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1 of this Authorization; or,

(iii) the ownership of the company specified in Section 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ; or

(c) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

GEORGIA-PACIFIC CANADA, INC.
Horizontal Cavity Shaftwall System

1. Applicant

Georgia-Pacific Canada, Inc.
350 Argyle Street North
Caledonia, ON
N3W 1M2

Tel: 770. 987. 5190 X 207
Fax: 770. 981. 6356

2. Manufacturing Facilities

Georgia-Pacific Canada, Inc.
350 Argyle Street North
Caledonia, ON
N3W 1M2

122 Old Dover Road
Newington, New Hampshire
USA
03801

3. Description

Georgia-Pacific Canada, Inc. horizontal cavity shaft wall system, is gypsum board with steel studs, channels and runners forming an assembly having a 2 hour fire-resistance rating for metal duct enclosures or ceiling membranes.

4. Authorization Requested

The applicant sought authorization for the use of the Georgia-Pacific Canada Inc. horizontal cavity shaft wall system as an assembly having a 2 hour fire-resistance rating for metal duct enclosures or ceiling membranes.

5. Assessment

Reports and assessments provided by the applicant show that if the Georgia-Pacific Canada Inc. horizontal cavity shaft wall system is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this Authorization, the level of performance required by the Ontario Building Code will be provided.

Reports submitted and reviewed include the following:

1. Test Report WH1-495-PSH-0196 & 0197.

2. Installation Instructions.

3. ICBO ES ER No. 2541.

4. ULC Label Program.

5. ITS/WHI Label Program.

6. Authorization

The applicant's design has been tested by an approved and recognized testing and inspecting agency. However, as outlined in Section 2.3. of the Ontario Building Code this type of installation is required to be designed and reviewed by an architect or a professional engineer experienced in the design of the structural or mechanical systems for building listed in Ontario Building Code Sentence 2.3.1.1.(1).

The Georgia-Pacific Canada, Inc. horizontal cavity shaftwall system is authorized for use as an assembly having a 2 hour fire-resistance rating for metal duct enclosures or ceiling membranes subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. This system shall be constructed as a non-load bearing assembly. This system shall be supported by construction having a fire-resistance rating of not less than what is required for the horizontal cavity shaftwall system.

2. The maximum span for this system shall be 2.18 m and the maximum of 2 hour fire-resistance rating from either side as determined on the basis of test results with ASTM E-119 and CAN4-S101 by Warnock Hersey International Inc.: File No. WH1-495-PSH-0196 and 0197, Job No., 50611-C7-043170, date tested 5th and 6th January 1993.

3. This horizontal cavity shaftwall system consists of at least 25.4 mm thick Fireguard Shaft Liner ™ (Type X shaftliner) and 12.7 mm Fireguard gypsum board. The liner and panels shall be fitted and fastened with C-T studs, steel runners, drywall screws, anchors, trim and sealant as per manufacturer's recommendations.

4. The manufacturer's detail drawings are contained in the 03/ 97 publication by G-P Gypsum Corporation, **"2-HR. USES FOR HORIZONTAL MEMBRANES"**.

5. Any and all the above data, details and tests shall be made available to any and all parties responsible for the design, detail, construction, installation and inspection of each installation.

B. GENERAL CONDITIONS

1. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

2. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

3 The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 24th day of May, 2001.

CULTURED STONE®

1. Applicant

Cultured Stone
A Division of Owens Corning Inc.
P.O. Box 270
Napa, CA
94559-0270

Tel: 800-255-1727
Fax: 707-255-5572

2. Manufacturing Facilities

Cultured Stone
A Division of Owens Corning Inc.
P.O. Box 270
Napa, CA
94550-0270

3. Description

Cultured Stone® is a manufactured light-weight, noncombustible stone intended for setting in cementitious stucco and providing an alternative finish coat or stone dash in both exterior and interior finish applications.

4. Authorization Requested

The applicant sought authorization for the use of Cultured Stone® as an alternative finish veneer or "dash coat" acceptable under Section 9.28. of the Ontario Building Code.

5. Assessment

Reports reviewed include the following:

1. National Evaluation Service, Report No. NER-358, Reissued May 1, 1996.

6. Authorization

Cultured Stone® is authorized as an alternative finish coat or stone dash under Subsection 9.28.6. of the Ontario Building Code for both exterior and interior finish applications, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. This Authorization is valid only for Cultured Stone®, a Division of Owens Corning Inc.

2. When used as an exterior finish coat attached to wood-frame construction, Cultured Stone® may only be installed to a maximum height of 10 m above grade.

3. Cultured Stone® shall not be used below grade and in locations subject to continuous usage under water.

4. Cultured Stone® shall be installed in accordance with the Cultured Stone® Manufacturer's Installation Instructions:

    a) Owens Corning 2/99 9000 A84E,

    b) SPEC-DATA® 2000 # 04720, and

    c) MANU-SPEC® 2000 # 04700.

5. Notwithstanding Condition 4. above:

    a) not less than 2 base coats of stucco shall be applied and the Cultured Stone® shall be applied into the outer base coat layer,

    b) individual Cultured Stones shall not exceed:

        i) 75 mm in thickness, and

ii) 750 mm in its longest dimension.

B. GENERAL CONDITIONS

1. The use of Cultured Stone® must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1a. hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 6. A. above; or

   (b) the occurrence of any of the events described in Sections 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1a. of this Authorization; or,

      (iii) the ownership of the applicant specified in Section 1a. of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 6. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 25th day of January, 2001.

Shelf and Rack Storage System

1a. Applicant

Auto-Stak Systems (Canada) Inc.
38A Bigwin Road, Unit 7
Hamilton, Ontario
L8W 3R4

Tel: (905) 318-0880
Fax: (905) 575-9859

1b. Manufacturing Facilities

Auto-Stak Systems (Canada) Inc.
38A Bigwin Road, Unit 7
Hamilton, Ontario
L8W 3R4

2. Description

The shelf and rack storage system is a self contained structural system within a building, having one or more elevated platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment. Shelf and rack storage systems are not considered to be mezzanines or interconnected floor spaces as defined by the Ontario Building Code and are not subject to mezzanine or interconnected floor space rules.

3. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

4. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Ontario Building Code.

5. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural system for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1.1 This Authorization is valid only for the AUTO-STAK SYSTEMS (CANADA) INC. Shelf and Rack Storage System.

Use and Occupancy

2.1 Except where more restrictively provided in 11.(c) below, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III, and IV commodities as defined in NFPA 231C-1998 as amended, and not for production, manufacturing, assembling /disassembling or ancillary administrative functions.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Ontario Building Code, as amended or remade from time to time.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be designed in accordance with Part 4 of the Ontario Building Code as amended or remade from time to time.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the Professional Engineers Act (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel roof decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Classes I, II and III commodities as defined in NFPA 231C-1998 as amended.

3.5 Lighting levels of walkways and platforms shall conform to the Ontario Building Code, as amended or remade from time to time.

3.6 Emergency lighting (shall be provided) on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2) and 3.2.7.4.(1) respectively of the Ontario Building Code, as amended or remade from time to time.

3.7 Guards and toe boards shall be installed in accordance with the Ontario Building Code, as amended or remade from time to time.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1996 and NFPA 231C-1998 as amended or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1996 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;
(b) loss of excess water pressure required to prevent false alarms in a wetpipe system;
(c) loss of air pressure in a dry pipe system;

(d) loss of air pressure in a pressure tank;
(e) a significant change in water level in any water storage container used for fire fighting purposes;
(f) loss of electrical power to any automatically starting electrical fire pump; and,
(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs 4.3 and 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signaling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signaling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the self and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall describe the Commodity Class referenced in A.22. above and the sprinkler design criteria used for each shelf and rack storage system. This sign or signs shall be permanently mounted, at or near the sprinkler control valve.

4.7 A standpipe and hose system shall be installed in accordance with the Ontario Building Code where the shelf and rack storage system has more than 4 elevated platforms or walkway levels, or the building is more than 14 m (45 ft.) in height.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Ontario Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Ontario Building Code as amended, except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;
(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,
(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m :

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer or Architect as defined in the Ontario Building Code, using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A.16. above) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time $=(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where:
- H_p = Horizontal travel distance on the shelf and rack storage (m)
- V_p = Vertical travel distance on the shelf and rack storage (m)
- H_m = Horizontal travel distance on the main floor (m)
- N_{lg} = Number of lift gates in the means of egress
- N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Ontario Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Ontario Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a "positive lock" when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

5.8 Where 'at-level' conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two 'at-level' conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the 'at-level' cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each 'at-level' conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the 'at-level' cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each 'at-level' cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1a. hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 5. A. above; or

(b) the occurrence of any of the events described in Sections 5. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1a. of this Authorization; or,

(iii) the ownership of the applicant specified in Section 1a. of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 5. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 25th day of January, 2001.

Use and Occupancy

2.1 Except where more restrictively provided in paragraph A 3.4 below, the shelf and rack storage system shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III, and IV commodities as defined in NFPA 13-1999, and not for production, manufacturing, assembling / disassembling or ancillary administrative functions.

2.2 The shelf and rack storage system is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Ontario Building Code, as amended or remade from time to time.

2.3 The shelf and rack storage system shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

General

3.1 The structural components of the entire shelf and rack storage system, including posts, beams, decks, walkways, connections and their supports such as concrete slabs, separate foundations or similar, shall be designed in accordance with Part 4 of the Ontario Building Code as amended or remade from time to time.

3.2 The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the Professional Engineers Act (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

3.3 Platform and walkway levels shall be of:

(a) solid construction consisting of steel plate or steel roof decking with a top substrate that forms a serviceable floor area, or

(b) open construction consisting of steel grating or open steel floor planking.

3.4 The maximum height of the shelf and rack storage system from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m except that where the maximum height exceeds 18 m but does not exceed 24 m, the following provisions shall apply:

(a) a fire alarm system shall be installed with:

(i) pull stations located at all exit doors including exit doors serving elevated decks and walkways; and

(ii) smoke detectors located, at the ceiling of all rooms and areas containing the shelf and rack system, within exit stair enclosures at the top, and at every third level of elevated deck or walkway; and

(b) the fire alarm system required by (a) above, shall be designed to notify the fire department upon activation; and

(c) the shelf and rack storage system shall be used only for the storage of Classes I, II and III commodities as defined in NFPA 13-1999 as amended.

3.5 Lighting levels of walkways and platforms shall conform to the Ontario Building Code, as amended or remade from time to time.

3.6 Emergency lighting on walkways, platforms, unenclosed egress stairs and exits providing means of egress, shall be provided to not less than the level and duration of illumination prescribed in Sentences 3.2.7.3.(2) and 3.2.7.4.(1) respectively of the Ontario Building Code, as amended or remade from time to time.

3.7 Guards and toe boards shall be installed in accordance with the Ontario Building Code, as amended or remade from time to time.

Fire Safety

4.1 An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility system including the top level and shall be in conformance with NFPA 13-1999 or the appropriate NFPA Standard for the most severe hazard to which the storage system is exposed. This shall include sprinkler protection under all platforms and walkways.

4.2 Except where the platforms or walkways are of open construction, any openings for egress stairs shall be protected by non-combustible draft stops as specified in NFPA 13-1999 (minimum 450 mm below the floors above).

4.3 The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system, to notify the person controlling the operation of the building for each of the following:

(a) movement of a control valve handle;
(b) loss of excess water pressure required to prevent false alarms in a wet pipe system;
(c) loss of air pressure in a dry pipe system;
(d) loss of air pressure in a pressure tank;
(e) a significant change in water level in any water storage container used for fire fighting purposes;
(f) loss of electrical power to any automatically starting electrical fire pump; and,
(g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

4.4 The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

4.5 The notification to the person controlling the building and the fire department referred to in paragraphs A 4.3 and A 4.4 above, shall be provided by way of:

(a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signalling Systems for Central Station Service", as amended;

(b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signalling Systems”, as amended;

(c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

(d) if the above mentioned facilities are not available in the municipality in which the self and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

4.6 A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall describe: a) the Commodity Class applicable and as referenced in paragraph A 2.1 or clause c) of paragraph 3.4 above, and b) the sprinkler design criteria used for each shelf and rack storage system. This sign or signs shall be permanently mounted at or near the sprinkler control valve.

4.7 A hose connection system shall be installed in accordance with Chapter 5-15.5 of NFPA 13 - 1999.

4.8 Where an enclosed exit stair is required, the standpipe and hose system shall be located not more than 5 m from the enclosed exit and installed in accordance with the Ontario Building Code.

4.9 Every platform or walkway level of the shelf and rack storage system shall be provided with fire extinguishers, installed in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

Exits

5.1 Each walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Ontario Building Code as amended, except as follows:

(a) access to exit may be provided from an elevated platform level by means of open unenclosed stairs for shelf and rack storage systems comprising not more than four platform levels, the highest of which may not be more than 12 m above the main floor; and,

(b) any single platform or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform or walkway does not exceed 200 m² in area;
(ii) travel distance on the platform or walkway to the level below, including the travel distance along the single unenclosed egress stair, does not exceed 25 m; and,
(iii) the platform or walkway below is provided with two separate egress stairs or exits.

5.2 The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs, shall not exceed 45 m. The maximum travel distance on an elevated platform to an enclosed exit serving that platform shall not exceed 45 m.

5.3 The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if this travel distance exceeds 45 m :

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a “time-based egress analysis” undertaken and sealed by a Professional Engineer or Architect as defined in the Ontario Building Code, using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A 5.6 below) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time

(b) the Total Egress Time shall be calculated using the following formula;

$$\textit{Total Egress Time} = (H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5 \textit{ (in seconds)}$$

where:

H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Ontario Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

5.4 Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated platform or walkway shall not exceed 9 m where the platform or walkway is required to be provided with at least 2 egress facilities.

5.5 Aisles serving the shelf and rack storage system shall have clear-aisle widths of not less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within the aisle or walkway.

5.6 Where exits are provided to comply with Sentence 3.4.2.5.(2) of the Ontario Building Code, main aisles serving the shelf and rack storage system on the ground floor (leading from egress stairs directly to an exit) shall be clearly demarcated and have a minimum unobstructed, clear-aisle width of 2.4 m.

5.7 Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a "positive lock" when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

5.8 Where 'at-level' conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two 'at-level' conveyor cross-overs may be within a single egress route,

(b) handrails spaced not more than 1 m apart and parallel to the direction of egress shall be provided on both sides of the 'at-level' cross-over,

(c) flat, metal inserts shall be placed between each roller over the required egress width at each 'at-level' conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails serving the 'at-level' cross-over and all inserts shall be sized to support loads required in Part 4 of the OBC,

(d) a clearly identified and easily accessible switch that will stop the conveyor shall be located at each 'at-level' cross-over, and

(e) stairs approaching 'at-level' conveyor cross-overs shall be marked in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

B. GENERAL CONDITIONS

1. The use of the shelf and rack storage system must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1a. hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 5. A. above; or

(b) the occurrence of any of the events described in Sections 5. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1a. of this Authorization; or,

(iii) the ownership of the Applicant specified in Section 1a. or of the companies specified in Section 5 A 1.1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 5. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 26th day of April, 2001.

AUTHORIZATION REPORT- Equalizer® 36 Chamber System

1. Applicant

Infiltrator Systems Inc.
4 Business Park Road
P.O. Box 768
Old Saybrook
CT 06475 USA

Tel: (860) 388-6639
Fax: (860) 388-6810
http://www.infiltratorsystems.com

2. Manufacturing Facilities

Infiltrator Systems Inc.
1315 Enterprise Dr.
Winchester, KY 40391 USA

1750 West 2450 South
Ogden, UT 84401 USA

3. Description

Infiltrator Equalizer® 36 Chambers are intended for use in a sewage system in lieu of absorption trenches constructed of stone and distribution pipe.

* The Infiltrator Equalizer® 36 Chambers are formed from injection molded polyolefin and connected end to end using a built-in latch. Chambers have a minimum bottom width of 570 mm and a minimum height of 320 mm. The louvered sidewalls have a minimum area of 0.65 m^2/m of length. The Equalizer® 36 Chamber is available in two length sizes: 2.54 m (8.33 ft), and 1.22 m (4 ft) with the latter referred to as the Quick 4 Equalizer® 36, and for the purposes of this Authorization both chamber lengths are referred to as the "Infiltrator Equalizer® 36 Chamber". The Equalizer® 36 Chambers are closed at the ends of a trench with snap-on end plates.

4. Authorization requested

The applicant sought authorization for use of the Equalizer® 36 Chamber System as an alternative to the construction of absorption trenches as required by Section 8.7 of the Building Code. The applicant requested that the Equalizer® 36 Chamber System be used to replace stone and distribution pipe in absorption trenches and filter beds that are:

i) gravity fed,
ii) "dosed" (non-pressurized distribution system), and
iii) pressurized.

Note: For the purposes of this authorization, "dosed" means a system in which effluent is pumped to the leaching bed either by pump or siphon, but the effluent is not pressurized within the leaching bed.

5. Assessment

Reports and assessments provided by the applicant show that if Infiltrator Equalizer® 36 Chambers are designed, performance tested, installed and maintained in accordance with the limitations in the manufacturer's instructions and the conditions stated in this authorization, a level of performance will be provided as required by the Building Code, for absorption trenches in soil, in leaching bed fill or in a filter bed, whether gravity fed, pressurized or "dosed".

Reports submitted and reviewed:

1. Infiltrator Systems Inc. - Environmental Onsite Wastewater Solutions (Promotional Brochure).

2. Final Report: Infiltrator Florida Side-by-Side Test Site - Nodarse & Associates (Geotechnical, Environmental Geotechnics & Material Engineers) - November 3, 1997.

3. Septic Installation Instructions For Equalizer® 36 Chambers.

4. Equalizer® 36 Detail Sheet.

5. Infiltrator Systems Inc. Aggregate-Free Chamber Systems Performance Research Summary - June 8, 2000.

6. The Longevity of Onsite Systems in Maine (Donald C. Hoxie and Stephen P. Dix) - Proceedings of the 2000 NOWRA Conference.

7. Request to Revise Application - November 16, 2000.

* 8. "Footprint Comparison Between Proposed Infiltrator Equalizer 36 Chamber and Conventional Leaching Bed in Ontario", Ontario Rural Wastewater Centre, March 2004.

* 9. Certificate of Registration, ISO 9001-2000, issued March 16, 2004.

* 10. Infiltrator Systems Inc, "Septic System Installation Instructions"

* 11. Excerpt from the EPA Onsite Wastewater Treatment System Manual.

6. Authorization

The use of the Infiltrator Equalizer® 36 Chamber System is authorized in sewage systems within the scope of Part 8 of the Building Code, as an alternative to stone and distribution pipes in absorption trenches and in filter beds, when installed in accordance with the manufacturer's recommendations and the Specific Terms and Conditions of this Authorization.

A. Specific Terms & Conditions

* 1. Except as permitted by Condition 2. below, when the Infiltrator Equalizer® 36 Chamber System is installed in lieu of distribution piping and stone, the length of the chamber system shall satisfy the requirements of Article 8.7.3.1. of the Building Code.

* 2. Except as provided by Condition 2.(a) below, when the Infiltrator Equalizer® 36 Chamber System is installed in lieu of distribution piping and stone in an absorption type trench leaching bed, the length of the chamber specified in Sentence 8.7.3.1.(2) of the Building Code, is permitted to be reduced such that it is calculated based on the formlua L = QT/300, where

L the total length of the Infiltrator Equalizer® 36 Chamber
Q the total daily design sanitary sewage flow
T the design percolation time

(a) A reduction to the chamber length is not permitted when,

(i) installed in soils with a percolation time of 6 min/cm or less,

(ii) combined with any other reduction, or

(iii) the width of the chamber bottom is less than 500 mm (20").

3. When the Infiltrator Equalizer® 36 Chamber System is installed in lieu of distribution piping and stone, the leaching beds must satisfy the general construction requirements specified in Articles 8.7.2.1., 8.7.4.2. and 8.7.5.3.

4. The minimum clearance distances required by Article 8.2.1.6. for distribution piping shall be met by the Infiltrator Equalizer® 36 Chamber System.

5. When installed in lieu of absorption trenches, the trenches for the Infiltrator Equalizer® 36 Chamber System shall be:

   a) approximately the same length and not more than 30 m in length,
   b) at least 600 mm and not more than 900 mm in depth,
** c) except as provided by 5.f, centred at least 1600 mm apart,
   d) at least 900 mm at all points on the bottom of the trench, above the high ground water table, rock or soil with a percolation time greater than 50 minutes, and
   e) backfilled, after installation of the Infiltrator Equalizer® 36 Chamber System, with leaching bed fill, so as to ensure that after the leaching bed fill settles, the surface of the leaching bed will not form any depressions.
* f) centred at least 2400 mm apart when the Infiltrator Equalizer® 36 Chamber is installed as an in-ground system at a reduced length, as it is permitted by Condition 2. of this Authorization.

6. When installed in lieu of distribution piping and stone in filter beds, the lines of Infiltrator Equalizer® 36 Chambers shall be evenly spaced over the surface of the filter medium to which the sewage effluent is applied, and the filter bed shall meet the following requirements:

   a) the filter medium shall have a minimum depth of 750 mm below the bottom of the Equalizer® 36 Chambers and shall be clean sand comprised of particles ranging in size between the limits of:

      i) an effective size of .25 mm with a uniformity coefficient not less than 3.5,
      ii) an effective size of 2.5 mm with a uniformity coefficient not greater than 1.5, and
      iii) having a uniformity coefficient not greater than 4.5.

   b) the surface of the filter bed shall be at least 900 mm above the high ground water table, rock or soil with a percolation time greater than 50 minutes.

   c) the other construction requirements of Sentences 8.7.5.3.(1) and (4) - (6).

7. When used in gravity fed conditions, the Infiltrator Equalizer® 36 Chamber System shall be installed in compliance with all the above-stated Specific Terms and Conditions and be:

   a) installed level over the length of the trench,

   b) securely connected, chamber to chamber, using the built-in latch,

   c) free of structural damage and used full length (not cut),

   d) equipped with end caps installed on both ends, and

   e) equipped with a built-in splash plate at the inlet end of each chamber line, to prevent soil scouring.

** 8. Where the sewage effluent is "dosed" to the leaching bed by pumps or a siphon to meet the requirements of 8.6.1.3.(1) (total trench length of 150 m or more), the Infiltrator Equalizer® 36 Chambers shall be installed to comply with all the above-stated Specific Terms and Conditions and:

   a) the effluent is pumped to a header line or distribution box prior to entering the chambers,

   b) a volume of effluent within the range of 3.5 - 8.0 litres per metre of Infiltrator Equalizer® 36 Chamber, must be pumped within a time period not exceeding 15 minutes, to meet the requirements of Sentence 8.6.1.3.(4)., and

** c) when the length of the Infiltrator Equalizer® 36 Chamber is reduced, as permitted by Condition 2. of this Authorization, the distribution pipe shall be installed in the chamber, according to the manufacturer's recommendations, and extended the total length of the trench.

9. Where the sewage effluent is distributed through a pressurized system, the Infiltrator Equalizer® 36 Chambers shall be installed:

   a) to comply with Specific Terms and Conditions numbers 1. through 6. above, and,

   b) with a minimum 1½ inch diameter pipe extending over the entire length of each trench, and such pipe:

      i) being specified by the manufacturer as acceptable for pressurized installations,

ii) having minimum 6 mm diameter orifices, spaced over its length to ensure even distribution of effluent,
iii) being supported in a manner as to ensure self-draining and prevent freezing of its contents,
iii) having clean-outs installed at the downstream end of each chamber line, to allow the system to be serviced, and
iv) receiving effluent from a treatment unit equipped with an effluent filter on the outlet, such effluent filter to be installed and sized in accordance with the manufacturer's recommendations.

B. General Conditions

1. The use of the Infiltrator Equalizer® 36 Chambers must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and except as specifically authorized herein, with the Building as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or
(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Building Code provision relevant to this Authorization has been amended or remade.

As Amended at Toronto this 26th day of August 2004.

RIKOS Ltd.

RIKOS non-destructive pipe restoration Process

1. Applicant

RIKOS Ltd.
5418 Yonge Street,
Suite 120
Toronto, Ont.
M2N 6X4

Tel: (416) 410-3815
Fax: (416) 223-1566

2. Manufacturing Facilities

RIKOS Ltd.
5418 Yonge Street,
Suite 120
Toronto, Ontario
M2N 6X4

3. Description

The RIKOS® non-destructive pipe restoration Process is intended for the rehabilitation of metallic potable water pipes. The RIKOS® non-destructive pipe restoration Process repairs pipes one-half inch in diameter to four inches in diameter. The RIKOS® non-destructive pipe restoration Process using existing access points along the water line riser, cleans the pipes with air pressure and sand. After removing the abrasive from the cleaned pipes, air pressure is used to test the lines for leaks and a fibrescope is employed to visually examine the cleaned surfaces. Air pressure is again employed to apply a non-toxic, two-component epoxy resin. Upon completion, the performance level of the restored pipe is not less than that which existed prior to the RIKOS® non-destructive pipe restoration Process.

4. Authorization requested

The applicant seeks a Building Materials Evaluation Commission (BMEC) authorization for the RIKOS® non-destructive pipe restoration Process as an alternative to repairing metal water pipes in existing buildings, as required by Article 7.1.2.2. - Alteration or Repair, and Section 7.2. - Materials and Equipment of Ontario Regulation 403/97, as amended or remade from time to time (the Ontario Building Code).

5. Assessment

Reports and assessments provided by the applicant show that if the RIKOS® non-destructive pipe restoration Process is designed, performance tested and installed in accordance with the manufacturer's instructions and limitations and the specific terms and conditions stated in this authorization, the level of performance required by the Ontario Building Code will be provided.

Reports submitted and reviewed:

1. Installation procedure including the Equipment List and Material Safety Data Sheet - RIKOS® Installation Manual (Revised 20/11/00)

2. Outline of the RIKOS® Training Program

3. Usage and limitation of the RIKOS® non-destructive pipe restoration Process

4. The RIKOS® Quality Assurance Manual and Checklist (Revised 20/11/00)

5. "Report on epoxy usage in drinking water system components"

6. The RIKOS® Service Agreement Warranty dated November 21, 2000.

6. Authorization

Use of the RIKOS® non-destructive pipe restoration Process is authorized as an alternative to traditional metal water pipe repair and/or replacement, subject to the following:

A. Specific Terms & Conditions

1) Only manufacturer trained and approved installation personnel shall perform the RIKOS® non-destructive pipe restoration Process according to the Material Safety Data Sheets supplied, the RIKOS® Installation Manual and the RIKOS® Quality Assurance Manual and Procedures.

2) The manufacturer shall provide field training to all installers and such training will be delivered by an experienced technician approved by RIKOS® and in accordance with the RIKOS® Training Manual.

3) The RIKOS® non-destructive pipe restoration Process shall only be used on pipe of ½ inch to 4 inches in diameter and in single pipe segments from ten to one thousand feet in length.

4) The RIKOS® non-destructive pipe restoration Process shall not be used in fire protection systems such as standpipe and sprinkler systems.

5) The non-toxic, two-component epoxy resin shall meet the ANSI / NSF-61-2000 standard as determined by a Standards Council of Canada accredited laboratory, and be an epoxy that is appropriate to the application and applied in accordance with the manufacturer instructions.

   (i) The thickness of the epoxy coating shall be determined by the epoxy manufacturer process instructions. The reduction in pipe diameter from the coating should be considered minimal and not essential for the flows in the pipes.

(ii) The curing process shall be supervised at all times by RIKOS personnel in accordance with the instructions of the epoxy manufacturer.

(iii) All materials and including the two-component epoxy resin equipment used in the RIKOS non-destructive pipe restoration Process, shall be supplied by RIKOS® and shall be handled in accordance with the manufacturer's specifications.

6) Trained and authorized RIKOS® personnel in accordance with the RIKOS® Instruction Manual shall, upon completion of the work or segment of the work, perform a Fiberscopic Inspection to ensure the continuity and integrity of the applied lining.

7) The RIKOS® non-destructive pipe restoration Process shall include an installation guarantee as provided for in the RIKOS® Service Agreement Warranty.

8) Non-removable stickers or labels recording the following information shall be applied to each riser treated;

(i) a *name and telephone* label - identifying RIKOS as having treated the pipe and including the phone number to call for information,

(ii) a *warning* - that the pipe has been coated with an epoxy resin, and

(iii) a *warning* - not to torch, not to solder and to use pressure fittings only

B. General Conditions

1. The use of the RIKOS® non-destructive pipe restoration Process must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1a. hereof shall promptly notify the BMEC of:

(a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 5. A. above; or

(b) the occurrence of any of the events described in Sections 5. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1a. of this Authorization; or,

(iii) the ownership of the applicant specified in Section 1a. of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 5. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 30th day of November, 2000.

MAINLINE FULLPORT BACKWATER VALVE
(MAINLINE BACKFLOW PRODUCTS INC.)

1. Applicant

MAINLINE BACKFLOW
PRODUCTS INC.
12530-128 Street,
Edmonton, Alberta
T5L 1C9

Tel: (780) 413-7204
Fax: (780) 457-1210

2. Manufacturing Facilities

MAINLINE BACKFLOW
PRODUCTS INC.
12530-128 Street,
Edmonton, Alberta
T5L 1C9

3. Description

The Mainline Fullport Backwater Valve is a wastewater valve designed to operate in the normally open position, allowing therefore, unobstructed sewage flow and venting of the plumbing system. Under backflow conditions the valve closes to protect the building from sewer backup.

4. Authorization Requested

The applicant sought authorization for the use of the MAINLINE FULLPORT BACKWATER VALVE in the building drain.

5. Assessment

Reports reviewed include the following:

1. "MAINLINE PROTECTION - The Ultimate Backflow Protection" - description of the Mainline Backwater Valve.

2. Special Change to NPC 95, Article 4.6.4., adopted in October, 1998.

3. Canadian Standards Association (CSA) Certificate of Compliance # LM 109421-1, certifying the MAINLINE FULLPORT BACKWATER VALVE to comply with CSA Standard CAN/CSA-B181.1-M90 - ABS Drain, Waste and Vent Pipe and Pipe Fittings.

4. Numerous letters from Provincial and municipal jurisdictions endorsing the MAINLINE FULLPORT BACKWATER VALVE system in the building drain.

5. The MAINLINE FULLPORT BACKWATER VALVE "INSTALLATION" and "BUILDING OWNER MAINTENANCE" Instructions (2 pages).

6. Authorization

The MAINLINE FULLPORT BACKWATER VALVE is authorized for use in a building drain subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. This Authorization is valid only for the MAINLINE FULLPORT BACKWATER VALVE manufactured in compliance with Canadian Standards Association (CSA) Certificate of Compliance # LM 109421-1.

2. The MAINLINE FULLPORT BACKWATER VALVE shall be installed according to the manufacturer's installation instructions, which requires, among other things, that all valves (in new or retrofit applications) be installed on a minimum 2% grade.

3. Each MAINLINE FULLPORT BACKWATER VALVE shall serve not more than one dwelling unit or occupancy in a building.

4. The Applicant named in Part 1 of this Authorization shall provide a copy of the MAINLINE FULLPORT BACKWATER VALVE "INSTALLATION" and "BUILDING OWNER MAINTENANCE" instructions with each valve sold, in addition to the Installation and Maintenance Instructions injected on the top of every valve.

5. This Authorization is valid only for MAINLINE FULLPORT BACKWATER VALVE installations in buildings constructed under Part 9 of the Ontario Building Code.

B. GENERAL CONDITIONS

1. The use of the MAINLINE FULLPORT BACKWATER VALVE must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Part 1 hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in 6. A. above; or

   (b) the occurrence of any of the events described in Conditions 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Part 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Part 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 28th day of September, 2000.

BUILDING MATERIALS EVALUATION COMMISSION (BMEC) AUTHORIZATION REPORT

DATE OF AUTHORIZATION **September 28, 2000**
BMEC REFERENCE **BMEC 00-10-250**
BMEC APPLICATION **# A 2000-17**

DASHWOOD INDUSTRIES LTD
Siteline (S-700 or Silensia) Patio Door with sealed dual pane 3mm glass

1. Applicant

Dashwood Industries Ltd
Highway # 4
Centralia, ON
N0M 1K0

Tel: (519) 228-2055
Fax: (519) 228-2091

2. Manufacturing Facilities

Dashwood Industries Ltd.
Highway # 4
Centralia, ON
N0M 1K0

3. Description

The applicant manufactures patio doors with glass composed of a sealed unit of 3 mm tempered glass + air space + 3 mm tempered glass and having an overall thickness of 23 mm and a maximum area of 1.98 m^2. The 3 mm sealed, dual pane patio door glass is used in a line of sliding doors referred to as Siteline, S-700 and/or Silensia.

4. Authorization Requested

The applicant sought authorization from the BMEC recognizing that the use of 3mm dual pane patio door glass in a line of sliding patio doors referred to as Siteline, S-700 and/or Silensia, provided an equivalent (or better) level of performance (structural strength) as required by Table 9.6.6.1. of the Ontario Building Code.

5. Assessment

Reports and assessments provided by the applicant demonstrate that the Siteline, S-700 and/or Silensia patio doors with sealed units of 3 mm tempered glass, equal or exceed the requirements of the CAN/CGSB 12.20-M, “Structural Design of Glass for Buildings” and other significant door properties.

Reports and Assessments reviewed included the following:

1. AIR-INS inc. - Report A1-01192-A of 10/01/96

2. Performance Test Data for PH Tech Patio Door system.

3. Letter dated June 26th, 2000 from Gary Burrows, P. Eng. certifying to the correctness of the submitted documents.

4. Sample Quality Manual from supplier Trulite Industries.

5. Supplemental Report from AIR-INS inc. dated September 7, 2000.

6. Authorization

The use of Dashwood Industries Ltd. 3mm dual pane patio door glass in a line of sliding doors referred to as Siteline, S-700 and/or Silensia is authorized as providing a level of performance that is equivalent to that required by Sentence 4.3.6.1.(1) of the OBC, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. Use of the Dashwood Industries Ltd. 3 mm, dual pane patio door glass must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. This Authorization is valid only for the Dashwood Industries Ltd. Siteline, S-700 and/or Silensia patio door models having maximum glass areas of 1.98 m^2.

B. GENERAL CONDITIONS

1. The Applicant named in Section 1. hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 6. A. above; or

(b) the occurrence of any of the events described in Sections 6. B. 2. (a) and (b) (ii) below.

2. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant or manufacturer specified in Sections 1. or 2. respectively of this Authorization; or,

(iii) the ownership of the applicant specified in Section 1. of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 28th day of September , 2000.

DASHWOOD® an Andersen® company
Andersen SKS Skylights with Fiberglass Sash & Condensate Channel

1. Applicant

Dashwood Industries Ltd
Highway # 4
Centralia, ON
N0M 1K0

Tel: (519) 228-2067
Fax: (519) 228-2089

2. Manufacturing Facilities

Dashwood Industries Ltd.
Highway # 4
Centralia, ON
N0M 1K0

3. Description

The DASHWOOD® an Andersen® company SKS skylight models SKS 1638, SKS 1646, SKS 2427, SKS 2438, SKS 2446, SKS 2457, SKS 2472, SKS 2838, SKS 2846, SKS 2857, SKS 2872 and SKS 4446, are fabricated with a pultruded fibreglass-reinforced plastic composite sash attached to a wood frame. Drainage of water condensate is to a condensation channel where the water is held until it evaporates due to convection currents in the living space.

4. Authorization Requested

The applicant sought authorization for the use of DASHWOOD® an Andersen® company fiberglass skylight models SKS 1638, SKS 1646, SKS 2427, SKS 2438, SKS 2446, SKS 2457, SKS 2472, SKS 2838, SKS 2846, SKS 2857, SKS 2872 and SKS 4446, available in high performance (HP) tempered glass, HP tempered laminated glass, HP tempered with Sun2 coating and HP tempered laminated glass with Sun2 coating.

5. Assessment

Reports and Assessments reviewed included the following:

1. Letter from Mr. Gary Burrows, P.Eng, dated February 8, 2000.
2. Drawings
3. Specifications for Fiberglass Lineals
4. "Benefits of Fiberglass" dated January 2, 2000.
5. NWWDA Structural Test Reports rendered to Andersen Corporation dated September 9, 1998.
6. Thermal and Condensation Test Reports dated June 23, 1998.
7. Thermal and Condensation Test Reports (Skylight) dated August 31, 1999.
8. Solar Heat Gain Coefficient Test Reports dated June 23, 1998.
9. Site Installation Manuals - revised August 13, 1998.
10. Quality System Documents.
11. Anderson Roof Window Catalogue
12. Evaporation Calculations - Engineering Report No. ARC-CP02 prepared by Aspen Research Corporation dated June 22, 2000 and revised July 28, 2000.
13. AAMA 310 - 97 "Voluntary Specification for Reinforced Thermoplastic Fenestration Exterior Profile Extrusions" (Pg 1-10).
14. AAMA 1600 - 90 "Voluntary Specification for Skylights" (Pg 1- 6).
15. NWDMA I.S 7 - 87 "Industry Standard - Skylight / Roof windows" (8 pgs).
16. Letter and attachments of October 23, 2000 from Mark Mikkelson, Codes/Regulatory, Andersen Corporation, Bayport, Minnesota.

6. Authorization

The DASHWOOD® an Andersen® company SKS skylight models described above are authorized as providing a level of performance equivalent to that which would be achieved by conformance with Article 9.7.7.1. of the OBC, when designed, manufactured, installed and maintained in accordance with the manufacturer's recommendations and the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. This Authorization is valid only for the DASHWOOD® an Andersen® company SKS skylight models described in Section 3. above**.**

B. GENERAL CONDITIONS

1. The use of the DASHWOOD® an Andersen® company SKS skylight models listed herein must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1. hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 6. A. above; or

   (b) the occurrence of any of the events described in Sections 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1 of this Authorization; or,

      (iii) the ownership of the applicant specified in Section 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in this Authorization; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 26th day of October, 2000.

7. Alberta Research Council Reference No. PL96-7, dated May 24, 1996.

8. Inchcape Testing Services Warnock Hersey. Report No. 7305, dated April 1996, which includes testing of the E-ZDeck material in accordance with ASTM E84-90.

9. Inchcape Testing Services Warnock Hersey. Report No. 7305B, dated April 1996, which includes testing of the E-ZDeck material in accordance with ASTM D635 and D1929.

10. Inchcape Testing Services Warnock Hersey. Report No. 484-9264, dated May 3, 1996, which includes testing of the E-ZDeck material in accordance with ASTM D3679-91 and 1000 hours of QUV weathering in accordance with ASTM G53.

11. Alberta Research Council Reference No. PL96-16, dated April9, 1996, which includes testing of the E-ZDeck material in accordance with ASTM D256 and E831.

12. Alberta Research Council Addendum to report issued April 9, 1996 and September 16, 1996.

13. Alberta Research Council Reference No. PL96-34, dated July 16, 1996, which includes testing of Pressure treated Pine and Douglas Fir solid sawn lumber in accordance with ASTM D256.

14. Alberta Research Council Reference No. PL96-34, dated June 27, 1996, which includes testing of Pressure treated Pine and Douglas Fir solid sawn lumber in accordance with ASTM D256.

15. Alberta Research Council Reference No. PL96-22, dated May 24, 1996, which tested the E-ZDeck composite deck rail system in accordance with Paragraph 1710.3.1. of the BOCA National Code.

16. Pultronex Corporation, Quality Policy Manual for the Quality System used at 2305 - 8th Street, Nisku, Alberta, dated October 11, 1996 and signed by representatives of Pultronex Corporation and the third-party inspection agency, Inchcape Testing Services.

6. Authorization

The EZ-Deck® flooring system is authorized for use as an exterior floor deck subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. The use of the EZ-Deck® flooring system must comply with the *Building Code Act, 1992* as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. This Authorization is valid only for the Pultronex Corporation EZ-Deck® flooring system and does not include the guard/railing system.

4. This authorization is valid only for EZ-Deck® flooring system applications in buildings constructed under Part 9 of the Ontario Building Code.

5. The EZ-Deck® flooring system shall have a maximum span of 610 mm (24") between the subfloor joists that support it.

6. Quality control shall be maintained in accordance with the Quality Policy Manual dated October 11, 1996 for the Quality System used at 2305 - 8th Street, Nisku, Alberta and audited by a third-party accredited quality control agency.

B. GENERAL CONDITIONS

1. The Applicant named in Section 1a. hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 5. A. above; or

   (b) the occurrence of any of the events described in Sections 5. B. 2. (a) and (b) (ii) below.

2. The BMEC may amend or revoke this Authorization where it determines that:

   (a) any change has been made to:

      (i) the material, system or building design that is the subject matter of this Authorization;

      (ii) the address of the applicant specified in Section 1a. of this Authorization; or,

      (iii) the ownership of the applicant specified in Section 1a. of this Authorization.

   (b) the use of the material, system or building design authorized herein;

      (i) does not comply with the *Building Code Act, 1992* or any relevant legislation as they may be amended or re-enacted from time to time; or

      (ii) provides an unsatisfactory level of performance, in situ.

   (c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 5. A. above; or

   (d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 25th day of May, 2000.

BUILDING MATERIALS EVALUATION COMMISSION (BMEC) AUTHORIZATION REPORT

DATE OF AUTHORIZATION **April 27, 2000**
BMEC REFERENCE **BMEC 00-07-247**
BMEC Application **# 2000-10**

CRISPLANT INC.
Material Handling Platform System

1a. Applicant

CRISPLANT INC.,
7495 New Technology Way
Frederick MD, USA
21703-9401

Tel: (301) 624-1874
Fax: (301) 662-0449

1b. Manufacturing Facilities

CRISPLANT INC.,
7495 New Technology Way
Frederick MD, USA
21703-9401

2. Description

The shelf and rack storage ('pick' module) system is a self contained structural facility within a building, having one or more solid intermediate platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment.

3. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

4. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Ontario Building Code.

5. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural facility for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. The use of the shelf and rack storage system must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. This Authorization is valid only for Crisplant Inc. Material Handling Platform Systems.

4. Deck and walkway levels shall be constructed of:

   (a) solid steel plate;
   (b) steel roof decking with a top substrate that forms a serviceable floor area;
   (c) open steel grating; or
   (d) open steel floor planking.

5. The structural design of the entire shelf and rack storage facility support system including posts, beams, decks, walkways, connections, and their supports such as concrete slabs, separate foundations or similar shall be in accordance with Part 4 of the Ontario Building Code as amended or remade from time to time.

6. The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the Professional Engineers Act (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

7. An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility including the top level and shall be in conformance with NFPA 13-1994 and NFPA 231C-1995 as amended or the appropriate NFPA Standard for the most severe hazard to which the storage facility is exposed. Additionally, sprinkler protection shall be provided under decks and walkways.

8. Except where the deck is of open steel grating, any opening in a deck for egress, convenience stairs, ramps or chutes, shall be protected by smoke baffles (minimum 450 mm below the floors above) and close spaced sprinklers as per paragraph A.7. above.

9. A sprinkler system located in a cold storage or freezer environment shall be designed to address any possibility of freeze-up resulting from condensation of water vapour internal to the system.

10. The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system to notify the person controlling the operation of the building for each of the following:

    (a) movement of a control valve handle;
    (b) loss of excess water pressure required to prevent false alarms in a wetpipe system;
    (c) loss of air pressure in a dry pipe system;
    (d) loss of air pressure in a pressure tank;
    (e) a significant change in water level in any water storage container used for fire fighting purposes;
    (f) loss of electrical power to any automatically starting electrical fire pump; and,
    (g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

11. The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

12. The notification to the person controlling the building and the fire department referred to in paragraphs A.10 and A.11 above, shall be provided by way of:

    (a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signaling Systems for Central Station Service", as amended;

    (b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signaling Systems”, as amended;

    (c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

    (d) if the above mentioned facilities are not available in the municipality in which the self and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

13. The maximum height of the shelf and rack storage facility from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m.

14. Each deck, walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Ontario Building Code as amended, except as follows:

    (a) access to exit may be provided from a platform level by means of open unenclosed stairs for shelf and rack storage facilities comprising not more than three platform levels, the highest of which may not be more than 9 m above the main floor; and,

(b) any single platform, deck or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform, deck or walkway does not exceed 200 m² in area;
(ii) travel distance on the platform, deck or walkway to the level below, including the travel distance along the single unenclosed egress stair does not exceed 25 m; and,
(iii) the platform, deck or walkway below is provided with two separate egress stairs or exits.

15. The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs shall not exceed 45 m. Where an enclosed exit serves an elevated platform, the maximum travel distance on the elevated platform to the enclosed exit shall not exceed 45 m.

16. Where required exits are provided to comply with Sentence 3.4.2.5.(2) of the Ontario Building Code, main aisles serving the shelf and rack storage on the ground floor shall be a minimum 2.4 m wide, clearly demarcated and spaced not more than 60m on centre.

17. The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if the travel distance exceeds 45 m :

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer as defined in the Professional Engineers Act (Ontario) using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A.16. above) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where: H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Ontario Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

18. Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a "positive lock" when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be painted in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

19. Where 'at-level' conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two 'at-level' conveyor cross-overs may be within a single egress route,

(b) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails leading over the conveyor that the cross-over serves and all inserts shall be sized to support loads required in Part 4 of the OBC,

(c) the shelf and rack storage system design shall provide at each ‘at-level’ cross-over, a clearly identified and easily accessible switch that will stop the conveyor that the conveyor cross-over serves, and

(d) stairs approaching ‘at-level’ conveyor cross-overs referred to in (a) above, shall be painted in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

20. Fire extinguishers shall be installed on every platform or walkway level of the shelf and rack storage system in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

21. Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated deck or walkway shall not exceed 9 m where the deck or walkway is required to be provided with at least 2 egress facilities.

22. The clear aisle width in the ‘pick modules’ shall not be less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within an aisle or walkway.

23. The shelf and rack storage facility is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Ontario Building Code, as amended or remade from time to time.

24. The shelf and rack storage facility shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III, and IV commodities as defined in NFPA 231C-1995 as amended, and not for production, assembling/disassembling, manufacturing, or ancillary administrative functions.

25. A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall describe the above Class and the sprinkler design criteria used for each shelf and rack storage facility. This sign or signs shall be permanently mounted, at or near the sprinkler control valve.

26. The shelf and rack storage facilities shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

27. A standpipe and hose system shall be installed in accordance with the Ontario Building Code where the shelf and rack storage facility height is more than 14 m (45 ft.) in height or where there are more than 3 elevated platforms of walkway level.

28. Where a standpipe and hose system is required, 65 mm (2 1/2 in.) diameter hose connections shall be provided, except that 38 mm (1 1/2 in.) hose connections are permitted in the shelf and rack storage facilities which:

    (a) do not exceed 6 levels including the floor level; and,

    (b) do not exceed 3,716 m^2 (40,000 ft^2) in the sum total of all levels of the shelf and rack storage facility.

29. Lighting levels of decks, walkways and platforms shall conform to the Ontario Building Code, as amended or remade from time to time.

30. Emergency lighting shall be provided on walkways, decks, platforms, unenclosed egress stairs and exits providing means of egress, to not less than the average level of illumination prescribed in Sentence 3.2.7.3.(2) of the Ontario Building Code, as amended or remade from time to time.

31. Guards and toe boards shall be installed in accordance with the Ontario Building Code, as amended or remade from time to time.

B. GENERAL CONDITIONS

1. The Applicant named in Section 1a. hereof shall promptly notify the BMEC of:

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 5. A. above; or

    (b) the occurrence of any of the events described in Sections 5. B. 2. (a) and (b) (ii) below.

2. The BMEC may amend or revoke this Authorization where it determines that:

    (a) any change has been made to:

        (i) the material, system or building design that is the subject matter of this Authorization;

        (ii) the address of the applicant specified in Section 1a. of this Authorization; or,

        (iii) the ownership of the applicant specified in Section 1a. of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 5. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 27th day of April, 2000.

BUILDING MATERIALS EVALUATION COMMISSION (BMEC) AUTHORIZATION REPORT

DATE OF AUTHORIZATION **April 27, 2000**
BMEC REFERENCE **BMEC 00-06-246**
BMEC Application **# 2000-09**

RAPISTAN DEMAG CORPORATION
Material Handling Platform System

1a. Applicant

RAPISTAN DEMAG CORPORATION
507 Plymouth Avenue N.E.
Grand Rapids, MI
49505-6098

Tel: (616) 913-5139
Fax: (616) 336-5881

1b. Manufacturing Facilities

RAPISTAN DEMAG CORPORATION
507 Plymouth Avenue N.E.
Grand Rapids, MI
49505-6098

2. Description

The shelf and rack storage ('pick' module) system is a self contained structural facility within a building, having one or more solid intermediate platforms or walkway levels for personnel access. The walkways and platforms may also support conveyors and other distribution equipment.

3. Authorization Requested

The applicant sought authorization for the use of an innovative shelf and rack storage system designed for material handling, storage and distribution in warehouse facilities.

4. Assessment

Reports and assessments provided by the applicant show that if the shelf and rack system is used in accordance with the limitations and conditions stated in this authorization, it will provide the level of performance that would be achieved by conformance with the Ontario Building Code.

5. Authorization

The shelf and rack storage system is authorized for use within a building as a self contained structural facility for material handling, storage and distribution, subject to the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. The use of the shelf and rack storage system must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall be included with an application for a building permit and shall be posted and maintained on the site of the construction with the building permit.

3. This Authorization is valid only for Rapistan Demag Corporation Material Handling Platform Systems.

4. Deck and walkway levels shall be constructed of:

   (a) solid steel plate;
   (b) steel roof decking with a top substrate that forms a serviceable floor area;
   (c) open steel grating; or
   (d) open steel floor planking.

5. The structural design of the entire shelf and rack storage facility support system including posts, beams, decks, walkways, connections, and their supports such as concrete slabs, separate foundations or similar shall be in accordance with Part 4 of the Ontario Building Code as amended or remade from time to time.

6. The design and general review of the rack and storage system shall be carried out by a Professional Engineer as defined in the Professional Engineers Act (Ontario). The Professional Engineer shall provide the Chief Building Official with a document certifying that the installation conforms with this Authorization. The construction drawings shall require the provision of an appropriate sign to indicate the maximum permissible design loads for each rack storage system and such sign shall be permanently fixed to the building interior and displayed in a prominent unobstructed viewing position.

7. An automatic sprinkler system shall be designed, constructed, installed and tested for the entire shelf and rack storage facility including the top level and shall be in conformance with NFPA 13-1994 and NFPA 231C-1995 as amended or the appropriate NFPA Standard for the most severe hazard to which the storage facility is exposed. Additionally, sprinkler protection shall be provided under decks and walkways.

8. Except where the deck is of open steel grating, any opening in a deck for egress, convenience stairs, ramps or chutes, shall be protected by smoke baffles (minimum 450 mm below the floors above) and close spaced sprinklers as per paragraph A.7. above.

9. A sprinkler system located in a cold storage or freezer environment shall be designed to address any possibility of freeze-up resulting from condensation of water vapour internal to the system.

10. The automatic sprinkler system shall be electrically supervised to indicate a trouble signal on the building fire alarm system annunciator or where the building does not have a fire alarm system to notify the person controlling the operation of the building for each of the following:

    (a) movement of a control valve handle;
    (b) loss of excess water pressure required to prevent false alarms in a wetpipe system;
    (c) loss of air pressure in a dry pipe system;
    (d) loss of air pressure in a pressure tank;
    (e) a significant change in water level in any water storage container used for fire fighting purposes;
    (f) loss of electrical power to any automatically starting electrical fire pump; and,
    (g) a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for fire fighting purposes.

11. The automatic sprinkler system shall be designed to notify the fire department that a waterflow switch has been activated.

12. The notification to the person controlling the building and the fire department referred to in paragraphs A.10 and A.11 above, shall be provided by way of:

    (a) an independent central station conforming to NFPA-71, "Standard for the Installation, Maintenance, and Use of Signaling Systems for Central Station Service", as amended;

    (b) a proprietary control centre conforming to Chapter 4 of NFPA-72, “Standard for the Installation, Maintenance, and Use of Protective Signaling Systems”, as amended;

    (c) a central station conforming to ULC/ORD-C693-1994, “Central Station Fire Protective Signalling Systems and Services”; or

    (d) if the above mentioned facilities are not available in the municipality in which the self and rack storage system is to be built, an independent system is permitted to be used to transmit signals to the fire department.

13. The maximum height of the shelf and rack storage facility from the floor supporting the shelf and rack system to the topmost portion of the shelf and rack system shall not exceed 18 m.

14. Each deck, walkway or platform level shall be provided with not less than two exit stair shafts that conform to all requirements for exits as stated in the Ontario Building Code as amended, except as follows:

    (a) access to exit may be provided from a platform level by means of open unenclosed stairs for shelf and rack storage facilities comprising not more than three platform levels, the highest of which may not be more than 9 m above the main floor; and,

(b) any single platform, deck or walkway may be served by a single unenclosed egress stair leading to the platform or walkway level immediately below provided the:

(i) platform, deck or walkway does not exceed 200 m² in area;
(ii) travel distance on the platform, deck or walkway to the level below, including the travel distance along the single unenclosed egress stair does not exceed 25 m; and,
(iii) the platform, deck or walkway below is provided with two separate egress stairs or exits.

15. The maximum travel distance on an elevated platform to the ground floor level, including the travel distance along unenclosed stairs shall not exceed 45 m. Where an enclosed exit serves an elevated platform, the maximum travel distance on the elevated platform to the enclosed exit shall not exceed 45 m.

16. Where required exits are provided to comply with Sentence 3.4.2.5.(2) of the Ontario Building Code, main aisles serving the shelf and rack storage on the ground floor shall be a minimum 2.4 m wide, clearly demarcated and spaced not more than 60m on centre.

17. The maximum travel distance from the bottom of an unenclosed stair to an exit along a main aisle on the ground floor level shall not exceed 45 m, *except* that if the travel distance exceeds 45 m :

(a) an egress system serving the shelf and rack storage shall be designed on the basis of a "time-based egress analysis" undertaken and sealed by a Professional Engineer as defined in the Professional Engineers Act (Ontario) using the following criteria:

(i) occupant egress speed of 1 m/sec shall be used for horizontal egress routes within the shelf and rack storage,

(ii) occupant egress speed of 0.6 m/sec shall be used for vertical egress routes within the shelf and rack storage, measured on the diagonal along the nosing of the stairs,

(iii) occupant egress speed of 1.3 m/sec shall be used for horizontal egress routes along a main aisle (see paragraph A.16. above) on the ground floor level,

(iv) each lift-gate shall be accorded an egress time of 10 seconds,

(v) each 'at-level' conveyor cross-over shall be accorded a time of 5 seconds,

(vi) a Safety Factor of 1.5 shall be used in calculating the Total Egress Time

(b) the Total Egress Time shall be calculated using the following formula;

Total Egress Time = $(H_p + V_p/0.6 + H_m/1.3 + 10N_{lg} + 5N_{lc}) * 1.5$ *(in seconds)*

where: H_p = Horizontal travel distance on the shelf and rack storage (m)
V_p = Vertical travel distance on the shelf and rack storage (m)
H_m = Horizontal travel distance on the main floor (m)
N_{lg} = Number of lift gates in the means of egress
N_{lc} = Number of 'at-level' cross overs in the means of egress

(c) the Total Egress Time from any point in the shelf and rack storage system shall be a maximum of 4 minutes,

(d) a fire alarm system complying with Subsection 3.2.4. of the Ontario Building Code shall be installed in the building and there shall be smoke detectors under all solid decking and walkways,

(e) in addition to required pull stations, the shelf and rack storage system design shall provide for clearly identified and easily accessible pull stations at egress stairs, conveyor cross-overs or lift-gates located along egress paths, and

(f) the occupant load on each level of the shelf and rack storage system shall not exceed ten (10) persons per egress stair.

18. Where lift-gates are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two lift-gates may be within a single egress route,

(b) each lift-gate shall be equipped with a "positive lock" when open,

(c) when a lift-gate is open, it shall be designed to automatically stop the conveyor belt that it serves, and

(d) the lift-gate shall be painted in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that it is readily identifiable as part of the egress route.

19. Where 'at-level' conveyor cross-overs are incorporated along egress routes in the shelf and rack storage system design:

(a) a maximum of two 'at-level' conveyor cross-overs may be within a single egress route,

(b) flat, metal inserts shall be placed between each roller over the required egress width at each ‘at-level’ conveyor cross-over to provide a walking surface. At least two, minimum 100 mm wide inserts shall be arranged symmetrically between the handrails leading over the conveyor that the cross-over serves and all inserts shall be sized to support loads required in Part 4 of the OBC,

(c) the shelf and rack storage system design shall provide at each ‘at-level’ cross-over, a clearly identified and easily accessible switch that will stop the conveyor that the conveyor cross-over serves, and

(d) stairs approaching ‘at-level’ conveyor cross-overs referred to in (a) above, shall be painted in accordance with the Fire Safety Plan as required by the Ontario Fire Code, such that they are readily identifiable as part of the egress route.

20. Fire extinguishers shall be installed on every platform or walkway level of the shelf and rack storage system in accordance with the provisions of Part 6 of the Ontario Fire Code, as amended or remade from time to time.

21. Dead end travel distance to a point of choice of direction of horizontal travel to an egress facility from an elevated deck or walkway shall not exceed 9 m where the deck or walkway is required to be provided with at least 2 egress facilities.

22. The clear aisle width in the ‘pick modules’ shall not be less than 760 mm (30 in). This clearance is for access to exits and shall not be used for conveyors, trolleys, tracks or any other similar mode of product transportation within an aisle or walkway.

23. The shelf and rack storage facility is not permitted in a High Hazard Industrial Occupancy (F1) as defined in Article 1.1.3.2. of the Ontario Building Code, as amended or remade from time to time.

24. The shelf and rack storage facility shall be used only for the storage, accessing, retrieval, packing and distribution of Class I, II, III, and IV commodities as defined in NFPA 231C-1995 as amended, and not for production, assembling/disassembling, manufacturing, or ancillary administrative functions.

25. A plain legible sign or signs, with contrasting letters and titled "NOTICE", shall describe the above Class and the sprinkler design criteria used for each shelf and rack storage facility. This sign or signs shall be permanently mounted, at or near the sprinkler control valve.

26. The shelf and rack storage facilities shall be accessible to employees only and shall be designated, signed and posted as a "NO SMOKING" area conforming to the Ontario Fire Code, Ontario Regulation 388/97 as amended or remade from time to time.

27. A standpipe and hose system shall be installed in accordance with the Ontario Building Code where the shelf and rack storage facility height is more than 14 m (45 ft.) in height or where there are more than 3 elevated platforms of walkway level.

28. Where a standpipe and hose system is required, 65 mm (2 1/2 in.) diameter hose connections shall be provided, except that 38 mm (1 1/2 in.) hose connections are permitted in the shelf and rack storage facilities which:

    (a) do not exceed 6 levels including the floor level; and,

    (b) do not exceed 3,716 m^2 (40,000 ft^2) in the sum total of all levels of the shelf and rack storage facility.

29. Lighting levels of decks, walkways and platforms shall conform to the Ontario Building Code, as amended or remade from time to time.

30. Emergency lighting shall be provided on walkways, decks, platforms, unenclosed egress stairs and exits providing means of egress, to not less than the average level of illumination prescribed in Sentence 3.2.7.3.(2) of the Ontario Building Code, as amended or remade from time to time.

31. Guards and toe boards shall be installed in accordance with the Ontario Building Code, as amended or remade from time to time.

B. GENERAL CONDITIONS

1. The Applicant named in Section 1a. hereof shall promptly notify the BMEC of:

    (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorization, to comply with any of the terms and conditions set out in Section 5. A. above; or

    (b) the occurrence of any of the events described in Sections 5. B. 2. (a) and (b) (ii) below.

2. The BMEC may amend or revoke this Authorization where it determines that:

    (a) any change has been made to:

        (i) the material, system or building design that is the subject matter of this Authorization;

        (ii) the address of the applicant specified in Section 1a. of this Authorization; or,

        (iii) the ownership of the applicant specified in Section 1a. of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorization, has failed to comply with any of the terms and conditions set out in Section 5. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this 27th day of April, 2000.

ROYAL BUILDING SYSTEMS (Cdn) Limited

Royal Titan Garage™ Models 1A & 2A

1. Applicant

Royal Building Systems (Cdn) Ltd
1 Royal Gate Blvd.
Woodbridge, ON
L4L 8Z7

Tel: (905) 264-0698
Fax: (905) 264-0699

2. Manufacturing Facilities

Royal Building Systems (Cdn) Ltd
1 Royal Gate Blvd
Woodbridge, ON
L4L 8Z7

3. Description

Royal Titan Garage™ Models 1A and 2A are pre-engineered free-standing buildings of combustible construction that are sold as self-contained building packages to be erected on a concrete slab foundation or a concrete strip footing foundation. Both models use the unfilled rigid polymer forms manufactured using Royalloy™ B Material and reinforced with structural steel components. Royal Titan Models 1A and 2A are designed to be used as a vehicular garage or a shed-type storage building and not intended for habitation.

4. Authorization Requested

Royal Building Systems (Cdn) Limited seeks to have the Royal Titan Garage™ Models 1A and 2A authorized for use as pre-engineered, free-standing buildings of combustible construction under Sections 9.4. and 9.35. of Ontario Regulation 403/97 (the "Ontario Building Code").

5. Assessment

Reports and assessments provided by the Applicant demonstrate that if the self-contained, pre-engineered and free-standing buildings of combustible construction (Royal Titan Garage™ Models 1A and 2A) are constructed, installed and maintained in accordance with the limitations of the manufacturer's specifications and the conditions stated in this Authorization, a level of performance equivalent to that required by the Ontario Building Code under Sections 9.4. Structural Requirements and 9.35. Garages and Carports, will be provided.

Reports submitted and reviewed:

1. ISO 9001 Certificate

2. Assembly Manual for Royal Titan Garage ™ Model 1A, including the Limited Ten-Year Warranty

3. Assembly Manual for Royal Titan Garage ™ Model 2A, including the Limited Ten-Year Warranty

4. Structural Review and Drawings for Model 1A as prepared by Hannigan Engineering Limited and dated August 23rd, 1999.

5. Structural Review and Drawings for Model 2A as prepared by Hannigan Engineering Limited and dated August 23rd, 1999.

6. BOCA International Evaluation Report No. 99-9 and printed October, 1999

7. CCMC Evaluation Report 12536-R dated June 24th, 1999 of "The Royal Building System™"

8. Duracon® Coatings Data Sheet

9. Performance Data for Climaseal® coating

10. Performance Data for JS500® finishes

11. Trow Consulting Engineers Ltd. Report T94 -17, Flexural Testing of Cored Roof Elements, dated November 28th, 1994

12. Trow Consulting Engineers Ltd. Report T94 -14, Roof-to-Ridge-Beam Connection Tests Under Static and Cyclic Loading, dated September 7th, 1994

13. Flexural Properties of 100mm Wall Elements (Unfilled) - 5 pages

14. Mechanical Properties of S66-C Roof Assembly - 3 pages

15. Royal Building Systems (Cdn) Limited - Quality Procedure Manual - Section 10.0 (A) Inspection and Testing (Extrusion) - 4 pages

6. Authorization

The Royal Titan Garage™ Models 1A and 2A are authorized as providing a level of performance equivalent to that required under Section 9.4 and Subsection 9.35 of the OBC, when manufactured, installed and maintained in accordance with the limitations of the manufacturer's specifications and the following terms and conditions:

A. SPECIFIC TERMS AND CONDITIONS:

1. The Royal Titan Garage™ Models 1A and 2A shall be used only where the following design loads are not exceeded:

   (a) Specified roof live load of 1.44 kPa, due to snow and rain, and

   (b) Reference wind pressure of 0.58 kPa (for 1 in 30 year occurrence),

2. The foundation of the Royal Titan Garage™ Models 1A and 2A shall be designed, on an individual basis, to conform with Sections 9.12 and 9.15 of the Ontario Building Code for each specific building site. Wood mud sills as noted in Subsection 9.35.3.3. of the Ontario Building Code, are not permitted.

3. The Installation Manual shall require that the bottom face of the aluminum sill track ('Aluminium Track Kit') shall be covered by a full, unbroken coat of silicone to prevent the formation of a corrosion cell between the Aluminum and the concrete.

4. The Installation Manual shall specify that the exterior roof and walls of the Royal Titan Garage™ Models 1A and 2A shall not be painted and shall only be covered with manufacturer approved shingle or cladding products.

B. GENERAL CONDITIONS

1. The use of the Royal Titan Garage™ Models 1A & 2A must comply with the Building Code Act, 1992 as amended or re-enacted from time to time and, except as specifically authorized herein, with the Ontario Building Code as amended or remade from time to time.

2. A copy of this Authorization shall accompany each application for a building permit and shall be maintained on the site of the construction with the building permit.

3. The Applicant named in Section 1. hereof shall promptly notify the BMEC of:

   (a) the failure of the Applicant, or of the material, system or building design that is the subject matter of this Authorisation, to comply with any of the terms and conditions set out in Section 6. A. above; or

   (b) the occurrence of any of the events described in Sections 6. B. 4. (a) and (b) (ii) below.

4. The BMEC may amend or revoke this Authorization where it determines that:

(a) any change has been made to:

(i) the material, system or building design that is the subject matter of this Authorization;

(ii) the address of the applicant specified in Section 1 of this Authorization; or,

(iii) the ownership of the applicant specified in Section 1 of this Authorization.

(b) the use of the material, system or building design authorized herein;

(i) does not comply with the Building Code Act, 1992 or any relevant legislation as they may be amended or re-enacted from time to time; or

(ii) provides an unsatisfactory level of performance, in situ.

(c) the Applicant, or the material, system or building design that is the subject matter of this Authorisation, has failed to comply with any of the terms and conditions set out in Section 6. A. above; or

(d) any Ontario Building Code provision relevant to this Authorization has been amended or remade.

Dated at Toronto this March 30th, 2000.

THERMA-TRU

Therma-Tru Fiberglass Door Panels

1. Applicant

Therma-Tru Fiberglass Door Panels
108 Mutzfeld Road
Butler, IN
46721 USA

Tel: (219) 868-5811
Fax: (219) 868-5190

2. Manufacturing Facilities

Therma-Tru Fiberglass Door Panels
108 Mutzfeld Road
Butler, IN
46721 USA

3. Description

Therma-Tru's three lines of fibreglass door panels (Classic-Craft, Fiber-Classic and Smooth-Star) are composed of two fiberglass skins attached to a foamed-in-place polyurethane core and wood stiles. Rails are manufactured from a rot-resistant and machineable wood/plastic composite material.

4. Authorization Requested

The applicant sought to have its line of innovative fiberglass door panels authorized as equivalent to that required by Part 9 of Ontario Regulation 403/97 (the "Ontario Building Code") for use as exterior doors.

5. Assessment

Reports and assessments provided by the applicant show that if Therma-Tru's three lines of fibreglass door panels are used in accordance with the limitations and conditions stated in this authorization, they will provide a level of performance that is at least equivalent to that required in Subsection 9.6.5. of the Ontario Building Code.

Reports submitted and reviewed:

1. Product Manual - Door System Specifications issued Dec 99.

2. Technical Manuals including:

   - SHOP 3 Door Preparation (pages 1-7) issued Oct 94

   - ARCH 2 Architectural Details (pages 1-13) issued Oct 94

   - PERF 1 Air Infiltration (page 1) issued Oct 94

   - PERF 2 Resistance to Water Penetration (page 2) issued Oct 94

   - PERF 3 Thermal Transmittance (pages 3-5) issued Oct 94

   - PERF 4 Sound Transmittance (page 6) issued Oct 94

   - PERF 5 Forced Entry Resistance (page 7) issued Oct 94

   - PERF 6 Insulated Glass Performance (page 8) issued Oct 94

   - PERF 8 Structural Wind Load (pages 11-12)

   - SITE 1 Installation Instructions (pages 1-8)

3. Catalog No. MAFL99 (pages 1-100)

4. Thermal Performance Test Report No: NCTL-110-4157-1 dated January 16, 1992, of National Certified Testing Laboratories (pages 1-4, summary and attachment).

5. Structural Performance Test Report No: NCTL-110-4157-5 dated December 20, 1991, of National Certified Testing Laboratories (pages 1-2).

6. Sound Transmission Loss Test RAL™-TL83-182 dated August 4, 1983, of Riverbank Acoustical Laboratories (pages 1-2)

7. Structural Performance Test Report No: NCTL-210-1752-1S,2S,3S dated August 14, 1995, of National Certified Testing Laboratories (pages 1-6).

8. Forced Entry Resistance Test Report No: NCTL-210-1752-1F,2F,3F dated August 14, 1995, of National Certified Testing Laboratories (pages 1-4).

9. Door Impact Test in accordance with ASTM F-476 Section 18 Grade 10 dated February 24, 2000, Intertek Testing Services (pages 1-4).

6. Authorization

The use of Therma-Tru's three lines of fibreglass door panels, namely the Classic-Craft, Fiber-Classic and Smooth-Star models are authorized as providing an equivalent exterior door to that required in Subsection 9.6.5. of the Ontario Building Code:

A. SPECIFIC TERMS AND CONDITIONS:
